The demand for farm products should be scientifically satisfied. Over production, as well as under production dislocates industrial and economic balances, and in the end, results in economic waste. In 1910 we produced over eleven million bales of cotton. In 1911 we produced fifteen million bales and yet received sixty million dollars less than for the 1911 crop. Society had the benefit of the four million bales of cotton, but the farmer got sixty million dollars less than nothing for them. In 1915 we produced one billion and twenty-five million bushels of wheat and received nine hundred and forty-two million dollars for it. In 1916 we produced six hundred and forty million bushels and received one billion and twenty-five million dollars for it. Society had the benefit of three hundred and eighty-five million bushels of wheat, but the farmer received seventy-eight million dollars less than nothing for them. Thus it will be seen that simply to produce will not mean prosperity. Reliable official cost of production studies and records are in existence, proving inadequate returns to agriculture. This information should be widely circulated so that the public may know the truth. Further studies of cost of production, together with comprehensive studies of marketing, including prices actually received by farmers, are also needed.

Hours of Labor.

Neither the day nor the week is a unit upon which agricultural costs or income can be satisfactorily based. Conditions are so variable that it is difficult to prescribe a rule applicable to all localities or to any locality at all seasons. It is, however, becoming most difficult for farmers to secure laborers who are willing to work more hours than do laborers in other industries. Experience shows that the hours of farm hired laborers approximate the hours of labor finally prescribed in other industries. The nature of agricultural work is such that it cannot economically adjust itself to

a specific hour day. If a definite hour per day basis is determined upon in day must be the unit of all estimates in farm production costs.

Soil Fertility.

Economic conditions should be such that the farmer may operate his land so that its fertility shall be maintained and perpetuated. An adequate future supply of food requires that the fertility of the soil should be conserved and replenished. The people should unite in all measures, legislative or otherwise, that will permit and accelerate the movement of fertilizers in such form and quantities and at such prices as will enable farmers to maintain and conserve soil fertility.

Co-operative Marketing.

Economic and industrial conditions in agriculture necessitate co-operative marketing. Legal obstacles are now handicapping such effort. All necessary amendments should be made to State and Federal laws to clearly preserve to farmers the right of co-operatively marketing their farm products.

Farm Organizations.

Economic efficiency in agriculture is promoted by every agency which

adds to the knowledge, experience, satisfaction, technique and equipment of the individual farmers. For these purposes strong self-supporting farmers' organizations are urged, to develop leadership from their own ranks and in accord with their own best interests; and to represent the industry in its contact with other industries and with the public.

Storage.

Adequate food storage reservoirs are essential to a well-fed people. In time of heaviest production foods should be stored away in such quantities as will tide over periods of non-production. Depletion of these supplies during the harvest months will probably mean bread lines before spring. Wise public policy will encourage properly regulated storage by farmers and others of essential reserves of food.

The High Cost of Living.

Much of the complaint of the high cost of living is the result of extravagant living. The cost of living is high or low, according as the price of necessities of life rise above or fall below the general level of salaries, wages, and income. The present cost of

"Pretty Good Growth"

"You can see for yourselves that they grow better when they're planted in blasted holes. Those trees will be bearing soon and they'll pay for the work of planting before our neighbors' trees, planted in spade dug holes, have begun to blossom."

"It's not only easier and better for the trees but good hard business sense to plant orchards with

HERCULES DYNAMITE

"There are many other things, too, that explosives can be used for to help on the farm or in the orchard."

"The Hercules Powder Co. publishes a 68 page book, 'Progressive Cultivation,' that gives detailed instructions (illustrated with photographs and diagrams) for planting trees, digging ditches, cellars, or post holes, cultivating your bearing orchards, clearing land of stumps or rocks and doing many other things with the help of dynamite."

living is not due to the prices received by the farmer for his products, as shown by a comparison between farm prices, food prices, and wage levels. Reliable Government statements indicate that the percentage of increase in food prices is not as great as that of other commodities entering into the cost of present-day living or of the level of wages in other industries.

Land Tenures.

Land Tenancy is increasing, farm ownership is concentrating in the hands of non-resident land owners, a condition which from historic precedent presages declining national virility and if not checked ultimately a feudal peasantry. An independent, successful and permanent agriculture with the essential schools, churches, and social facilities, cannot be maintained on the basis of absentee ownership. Its inevitable end is not only a social cleavage which is opposed to the principles of our American Democracy, but another new and dangerous line of industrial cleavage and conflict. A permanent agriculture must be predicated on voluntary home-owning farmers politically free, socially satisfied and economically independent.

Farm Depopulation.

The farmers' efforts to secure higher wages or better working conditions are not based on an organized refusal to work. His environment gives him those qualities which make him sought by many other occupations and professions. Banks, factories, stores, transportation and commerce call to him to come to them, and the professions make their fine appeal. In the quiet of his home, with his family about him, his boy and girl decide to heed that call. One more family has left the army of food producers and another family has joined the army of food consumers.

Financing Agriculture.

The availability of capital used in agriculture is a matter of public concern. Direct extension of Federal credit through the land banks will reduce the cost of this capital and should be made easier of access to all farmers. Associated credits of farm communities should be developed under proper laws and leadership.

RIVERSIDE ALFALFA OFFICE.

The Alfalfa Growers of California, Inc., have opened a local office in Perris for the benefit of its members in that district. R. C. Hoyt, the present Riverside representative of the association, will be in charge, and invites all members, or those interested in the raising of alfalfa, to call on him in his new quarters in J. L. Greenleaf's office.

In opening this office, the Alfalfa Growers are putting into practice a new policy of opening local offices in all the alfalfa districts of the state as fast as it is found practicable and where they have a sufficient membership.

The local representatives in charge of these offices will, in all cases, be men who are well known by the members and the community at large, and in a great many instances, will be members of the association they represent.

Perris Valley is one of the important alfalfa sections of the state, as it produces a quality of alfalfa that is unsurpassed and that commands the top price at all times, and is in great demand.

The choicer grades have been bringing, within the past ten days, as high as \$33.50 f. o. b. Los Angeles.

Although the height of the shipping season is well past for this year, the members of the association are showing a great deal of interest and activity as they are already planning for the 1920 season. They expect to have a grading shed or warehouse of their own, under the control of their own Alvisory Board, where, if they desire, they can store their own hay and hold it for the higher prices in the winter months. It is planned that this warehouse is to be financed by the growers themselves, with the assistance of a local bank. There will be conspicuously posted, at the local office, the price alfalfa is worth to the grower, either at the ranch or f. o. b. his shipping point.

Coachella Valley cotton men are claiming 650 pounds of lint per acre.

Reliable Pumping Without Electric Power

—It Runs All Day Practically Without Attention

WE have built a special pumping outfit for a special demand where men can't get or don't want to use electric power.

The pump is direct connected to a highly efficient engine. Shoulder your shovel and work in another part of the field—you can leave this outfit to itself. You can rely on it—it will keep on pumping, maintaining the greatest volume of water possible.

This is the nearest thing to electric direct connected outfit that has ever been devised. It represents the very highest development in pumps of this type—the result of careful engineering by experts after years of experience.

Don't try old engines on your pump—install a complete outfit designed to do the work.

"BEAN" Universal Direct Connected Engine Driven Pump

The pump is thoroughly braced to withstand vibration, containing more metal than any other pump that we know.

Distance to water below surface of ground.....
 Probable distance to water when pumping.....
 If water is to be raised above surface of ground how high? (feet) and size of pipe lines.....
 Volume of water desired (Gals. per min.).....
 (Inches).....
 If you have pit, give width..... length.....
 depth.....
 H. P. of motor or engine if you have that equipment.....
 Give total depth of well.....
 Inside diameter of well.....
 Is well straight and true?.....
 Is electric power available?.....
 Name.....
 Address.....
 Rural Route No.
 211 Box.....

The extra heavy shaft is supported by an outboard bearing of most unusual size. The shaft can't get out of line.

Another distinctive "Bean" feature is the water seal. The shaft is continually surrounded by water where it enters the case, so there's no chance to lose the priming. The pump is automatically water balanced.

Mail the coupon for full information. This outfit can't be adequately described in the space of one announcement. You want to know all about it. Let us tell you. Mail the coupon now.

ERADICATION OF BERMUDA GRASS.

(Written for Pacific Rural Press by Prof. P. B. Kennedy, Univ. of California.)

In attempting to eradicate Bermuda grass, one must keep in mind the following points: Bermuda grass dislikes frost, drought, shallow plowing, and shade.

The first process should be the weakening and destruction of the plant as much as possible by close pasturing with sheep, and if possible in addition by hogs, which when not ringed will eat with relish large quantities of the roots. The leaf foliage also is excellent forage. When this is continued as far as seems practicable, the land should be plowed three or four inches deep, being careful to cut the furrow slice off clean and turn it over completely.

Next disk the sod with heavily weighted disks, going over it a sufficient number of times to cut the sod up thoroughly. This will loosen the dirt and separate it from the grass roots. Then go over the land with a spring tooth harrow to bring the pieces of grass to the surface and expose as much as possible of them to the drying-out powers of the sun. Wherever possible, these are raked together and burned. In the fall the land is plowed deeply, the deeper the better, and then planted to a winter crop. The character of the crop would depend upon the locality. The following season, which would be spring, if it is irrigated land, it may be put into an intertilled crop, or else it may be summer-fallowed, with thorough cultivation in either case. This will kill the sprouts which have recovered from the previous season.

Or, a third choice would be to put the land into a summer crop, such as Blackeye beans. These should be thoroughly cultivated until the rows meet, when they would produce a dense shade, which would be very hard on any remaining Bermuda grass.

The success of the method depends upon how much frost there is in the locality, and to what extent the weather will permit thorough dessication at the time of cultivation.

ORTHO SPRAYS will win the War against the Insects

ARCADIAN Sulphate of Ammonia

Watch for our talks on Top Dressing with ARCADIAN Sulphate of Ammonia. You will find them interesting as well as instructive.

ARCADIAN Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. Especially kiln-dried and ground to make it fine and dry. Ammonia 25 1/4%. Made in U. S. A. Arcadian is the great American Ammoniate.

Dressed Meat Demonstration.

A very interesting part of the California Cattlemen's Convention to be witnessed it, was a meat demonstration conducted by C. E. Schmidt of the Oakland Market. The object of the demonstration was to show the different cuts of meat and their weight from one-half a beef carcass, and the price for which each

would sell at retail. The wholesale price which the butcher would have to pay for the beef was estimated by Mr. Schmidt and Mr. Gallagher of the Western Meat Co.

First, the half carcass was weighed and then Mr. Schmidt commenced to cut it in just the same manner that he would in his market, weighing each piece and telling what it would be sold for today. After the cutting, weighing, and naming of each piece, the weight, name and the price per pound retail with total which would be received for it, was set down on a blackboard so that spectators could see it. After the cutting and weighing was completed a comparison was made between the total retail price of the different cuts and the whole price of the half carcass. The retail prices quoted were those paid for the same grade of beef over the block in the above mentioned market in Oakland. The results tabulated follow:

Total weight of the half-beef carcass—313 pounds at 15½ cents per pound\$47.52
Different cuts with price for which each would be sold:

Hind Quarter.			
Kidney	6½ lbs. at 11 cents	.71	
Flank steak	2 lbs. at 25 cents	.50	
Flank	9½ lbs. at 8 cents	.78	
Short loin of porchouse	21 lbs. at 35 cents	7.35	
Sirloin	31 lbs. at 28 cents	8.65	
Rump roast	14 lbs. at 20 cents	2.80	
Round roast	36 lbs. at 25 cents	9.00	
Heel piece	7 lbs. at 20 cents	1.40	
Hind shin	15 lbs. at 5 cents	.75	
	142	\$31.97	
Fore Quarter.			
Cross rib	11 lbs. at 24 cents	\$2.64	
Front shin	18 lbs. at 6 cents	1.08	
Plate	40 lbs. at 12½ cents	5.00	
Prime rib roast	26 lbs. at 28 cents	7.28	
Standard roast	13 lbs. at 22 cents	2.86	
Neck	20 lbs. at 10 cents	2.00	
Chuck	46 lbs. at 14 cents	6.44	
Prime rib roast	13 lbs. at 22 cents	2.86	
	174	\$27.32	
		\$31.97	
		\$59.29

THE HOME CIRCLE

TELLING STORY.

I know of a boy that's sleepy.
I can tell by the nodding head,
And the eyes that cannot stay open
While the good-night prayer is said.
And the whispered "Tell a 'tory,"
Said in such a drowsy way,
Makes me hear the bells of Dream-
land,
That ring at close of day.
So you want a story, darling!
What shall the story be?
Of Little Boy Blue in the haystack,
And the sheep he fails to see,
As they nibble the meadow clover
While the cows are in the corn?
O Little Boy Blue, wake up,
For the farmer blows his horn!
Or shall it be the story
Of Little Bo Peep I tell,
And the sheep she lost, and mourned
for,
As if awful fate befell?
Oh, the pigs that went to market—
That's the tale for me to tell!
The great big pig, and the little pigs,
And the wee, wee pig, as well.
Just look at the baby, bless him!
The little rogue's fast asleep.
I might have stopped telling stories
When I got to Little Bo Peep.
—Eben E. Rexford.

GRANDMA'S BIRTHDAY PARTY.

It was the evening of Marjory's birthday, and now she and grandma were having their usual, cosy bedtime chat. Marjory was perched on the arm of the great arm chair, telling grandma all about the party.
"Oh, it was the loveliest party, grandma!—and just think how many pretty gifts they brought me! Ruth says each one of them is a forget-me-not. Isn't that a nice way to think of birthday gifts? O grandma, what kind of a party did you have when you were seven?"
Grandma smiled, and her eyes

looked far away. "I had a very different party from yours, dear," she said, as she stroked the little girl's shining hair. "My parents loved me, as yours do you; but parties were few and far between in those days, and birthday gifts were as uncommon.

"I remember my seventh birthday. I wanted a party more than anything else in the world, I think, but I did not ask for one; some way I did not think it would be of any use. There were so many of us, and so little time for mere play; but after a while I thought out a plan all to myself.

"I went out under the pine-trees and raked the old, dead pine needles up into a great, brown square. That was to be my house. I gathered with care bits of spruce 'gum' from the gnarled spruce-trees in the grove, and hoarded it carefully for my party.

"Then I picked wild gooseberries,—not many, for the sharp thorns tore my hands dreadfully. Those, with the gum, were to be my feast. Spruce gum and sour green gooseberries are not very like your pink ice-cream and pinky white cake, are they, dear?"

"And next there must be presents. Think of a real birthday party without presents! But where were they to come from? Suddenly I thought of a new way of present giving.

"I went to the little box under mother's bed where I kept all my treasures. In it there were the three queer, pretty buttons that my Aunt Nancy had given me the day I stayed with her and gathered caraway seed for her spice box; and there were a few bright bits of calico, strung on a string, waiting some far-away piecing time. They were very precious to me, for you see even small pieces of cloth were not plentiful when I was a little girl. Then there was my knitting spool—such a very nice spool, with pins stuck neatly in the end of it, and purple and red yarns started on it. There were a few pink shells, and other things that I have forgotten. It was but a little girl's treasure box, and they were treasures indeed.

"Out they went into my apron, and then out with me under the big, beautiful, shadowy pines. What a great time I had then, trying to decide which of my sisters should have the precious buttons, and to whom should the calico pieces go. Of course, it was easily settled that little Joe must have the pink shells, for they were the only part of my treasures that a boy would really care for, you know.

"At last my party was ready for its guests, and I ran in half timidly to invite them. They were to be your great-aunts, Elizabeth and Mary and Ann, and then little Joe.

"The girls were all busily sewing, and I remember Elizabeth saying, 'Oh, dear, I don't want to stop and go out to that foolish party!' You see she was just learning to sew, and she felt very big and important. But dear Sister Mary said: 'Bless the child! Come on, every one of you.' And so they came, little Joe hopping and skipping beside me as we went.

"When we came to the grove, there was the little pine house, and there were four large plantain leaves on the ground, a place for each guest, and each leaf held the hoarded spruce gum and a few of the little green gooseberries; then on each leaf was a gift.

"I had chosen the quilt pieces for Elizabeth; the buttons for Mary (such bright, pretty buttons they were); and Ann received the knitting spool. Little Joe turned a handspring in delight at becoming the proud owner of the wonderful pink shells.

"What fun we had, and how they laughed! But, when it was over, Mary held me close and said: 'Bless the child! To think of her giving away her keepsakes for her birthday gifts!'"

"But, grandma," broke in Marjory, "didn't you even have a place at the table, and didn't you get a single thing?"

"Well, no," laughed grandma. "You see I was so busy fixing things that I forgot all about myself; but it didn't spoil my good time, and I didn't miss

He Who Invades the Realm of My Sway—BEWARE.

—Jack Frost.

All bunk—we have already "invaded" and are rapidly "busting" up the whole of Jack's kingdom. We are publishing the glad tidings that we may reach the few remaining victims of this shivering career.

On a cold morning—the real battle front of a man's life—if you can hop out of bed, strike a match, hop right back again, then get up and dress in a nice warm room, doesn't it beat all this fussing around with kindling and hustling wood?—the "battle" is over before it can start. The day starts right; you feel right and stay right. Let us show you how to overcome all this unpleasant stuff, put a stop to the expense and worry about fuel. You do not have to buy a new stove, not even change the old one. There is no question about oil being the fuel of the future—it is Nature's most abundant supply. When a simple, but natural operation, turns this fuel into a wonderfully clean, dry gas, as with the Dreadnaught Burner, you have an ideal condition that you will never depart from. Write for our Circular.

THE THANKSGIVING DINNER.

Thanksgiving, the happiest holiday of the autumn, is an occasion anticipated by all members of the family. The home-coming, reunions and festivities and the thoughts of the bounteous dinner, gives the day a peculiar joy. The religious character of the day may have changed, but the sincere feeling of thankfulness in every heart remains the same.

For that happy day, the house should be decorated with ferns, autumn leaves with their glowing colors, ears of corn, sheaves of wheat and bowls or baskets heaped with fruit and nuts. A well-shaped pumpkin hollowed out will make an attractive dish in which to pile fruit for the dinner table. Place cards with little personal jokes or rhymes are an addition to the jollity of the meal.

If it is desirable to dress the table more, use for a centerpiece a large pumpkin covered with yellow crepe paper, prettily crinkled, and green vines trailing down the sides. Make nut cups for each individual of the same color paper and connect with the centerpiece by yellow ribbon. Yellow candles in glass candlesticks help to carry out the color scheme.

The dinner itself is the crowning event of the day and most households cling to the traditions of New England in the type of meal served. Roast turkey or meat, cranberries, an abundance of vegetables, cider, steamed puddings and pies of mincemeat, pumpkin and apple usually grace the Thanksgiving table.

A very delicious soup may be made of lean meat to which is added when tender, carrot and turnip cubes, chopped onion and celery, as well as seasonings. When these vegetables are done, strain, cool, remove fat and put away. When reheated and served with crisp crackers, it will be found much better than a cream soup to precede a hearty meal.

Olives, celery and salted nuts add flavor to the meal and apple noisette is delicious with the meat course. Place a layer of apple sauce in a buttered baking dish, sprinkle with chopped almonds, macaroon crumbs and lemon juice, dot with butter, add a quarter of a cupful of hot water and bake for twenty minutes. Chill and serve with the meat.

The crowning glory of the meal is the roast turkey with its skin browned to a luscious crisp and its body filled with a delicious stuffing, but this year there will be many tables where the turkey will be replaced with chicken or a roast.

An attractive garnish for the platter is apple ginger in apple cups. Wipe, pare and chop two quarts of sour apples. Cook slowly for three hours with one and one-half cups of brown sugar, the juice of a lemon, two tablespoons of ginger, and enough water to prevent the apples from burning. This mixture may be made days ahead. Serve in cups made by cutting a thick slice from the stem end of bright red apples and removing the pulp with a spoon.

Any of the common vegetables are suitable for a Thanksgiving dinner—Browned mashed potatoes, boiled onions in cream sauce, squash baked and served in the shell are all acceptable.

For dessert, pies with flaky crusts and fruity puddings with sauce have the right of way.

Even the younger generation, whose usual choice of a dessert is ice cream, are willing on this day of all the year to accept the pudding and pies.

To conclude the dinner, serve nuts and raisins with coffee.

MINCE MEAT.

Six cups cooked beef chopped fine; 3 cups suet, chopped fine; 12 cups apples, peeled, cored and chopped; 2 cups sugar; 2 cups molasses, New Orleans; 2 pounds seedless raisins; ½ pound citron, shaved fine; 3 cups boiled cider; 1 tablespoon each ground cinnamon and nutmeg; 1 tablespoon each cloves and allspice; 1 tablespoon salt; 2 oranges, juice and grated rind; 2 lemons, juice and grated rind; 1 tablespoon almond extract; 1 glass of currant or quince jelly.

Put meat, suet, apples, sugar, molasses, raisins, citron, salt and cider into a large kettle; place over a slow fire, heating gradually. When apples and suet are cooked, add remaining ingredients and store in glass fruit jars. If more liquid is required, use the broth the meat was cooked in.

KINDERGARTENS.

That the great world war will be followed by years of agitation and change in which all institutions of government, including our own, will be tried and tested severely, is already evident from what is now taking place both in Europe and in America.

Intelligent democracy is the only protection against reaction toward autocracy on the one side and class rule, disintegration, and anarchy on the other.

Our American democracy, the hope of the world, demands universal education of the best type—education of all for freedom, initiative, self-restraint, co-operation, and obedience to law. In this education the kindergarten has a very important place. Its spirit is that of democracy, and tends toward freedom, initiative, self-restraint, co-operation, and obedience to law.

It is significant that the kindergarten did not receive governmental approval in Germany, because of this very fact of its spirit of democracy, and that Froebel looked to America for the attainment of his ideals in education.

For all our young children, both of native born and of foreign born parentage, and especially for the latter, kindergarten schools should be provided, either by public or by private support. Our millions of children of kindergarten age should no longer be deprived of the training which the kindergarten gives in industry, loyalty, patriotism, and the social virtues which are so essential in our political, social, and industrial democracy.

I should like to urge all school officers and all citizens who are interested in the welfare of the people and in the permanency and fullest development of our democracy to use their influence for the establishment and maintenance of kindergartens for all children.—P. P. Claxton, Commissioner of Education.

Go to the Ant, thou Sluggard,
Consider her ways and be wise.
She romps through the pantry and cupboard,
And eats all the bread and pies.
She lugs off the grains of sugar;
She gets in the oatmeal box;
She chews at the cakes and cookies;
She cares not for bolts nor locks.
Yes, go to the ant, thou sluggard,
Consider her ways and get wise.
A man can get rich off of others
Without working so hard, if he tries.
—Selah!

THANKSGIVING PUDDING.

Two and ½ cups of bread crumbs, 1 cup brown sugar, 1 cup raisins, seeded and cut in pieces, 2 tablespoons citron, ½ cup chopped walnuts, ½ teaspoon nutmeg, 1 teaspoon salt, 1 cup scalded milk, 3 eggs, ¼ cup each of currants and figs, 2 tablespoons candied orange peel cut in small pieces, 1 teaspoon cinnamon, ½ cup finely chopped suet.

Soak the bread crumbs in milk, add sugar, spices, salt and eggs, slightly beaten, raisins, currants and nuts, dredged with flour, the candied orange peel and citron. Cream the suet and work in the chopped figs. Combine mixtures, turn into a buttered mold and steam four hours. Serve with nectar sauce made by mixing half a cup of creamed butter with one cup of powdered sugar and one well-beaten egg. Beat over hot water until perfectly smooth and flavor with one teaspoon vanilla, or other flavoring, if preferred.

Durable-DURHAM Hosiery is a product of industrial democracy—never of Child Labor. We have no strikes or lockouts.

Full of warmth and full of wear

HERE is comfort for cold weather. Durable-DURHAM fleecy-lined Hosiery is warm, and because of this it is the sensible hosiery for winter wear. Every pair has soft, thick, fleecy lining. They have the strength to give long wear—and stay good-looking through many wearings and washings.

Durable-DURHAM Hosiery includes not only Fleecy-lined but other styles for every member of the family—for work, dress, or play—for every season of the year. The

children's stockings are made doubly strong to stand the hardest wear and tear. Styles for men and women include all fashionable colors and come in all weights from sheer mercerized to the heavy fleecy-lined.

Every pair is extra strongly reinforced at points of hardest wear. Legs are full length; tops wide and elastic; sizes are accurately marked. Soles and toes are smooth, seamless and even. The Durham dyes will not fade.

DURABLE DURHAM HOSIERY

FOR MEN, WOMEN AND CHILDREN

MADE STRONGEST WHERE THE WEAR IS HARDEST

Ask for Durable-DURHAM Hosiery and look for the trade mark ticket attached to each pair. You should be able to buy it at any dealer's. If you do not find it, please write to our sales department, 88 Leonard Street, New York, giving us the name of your dealer.

Durham Hosiery Mills, Durham, N. C.

Sales Office: 88 Leonard Street, New York

Money-back on Schilling Tea means: We know you will like the tea.

Try each kind at our expense until you find the one you like best.

TRUCK HAULS CHILDREN TO SCHOOL.

Some fine work in making the high school available to all children of the district is being done by the directors of the Washington Union high school of Easton, Fresno county. This is a strictly agricultural population, covering a large area, and the only way the children can attend is to provide their own transportation or have it provided. In order to make it possible for every child of proper age to attend, a motor truck has been purchased and fixed to carry 40 passengers. This is run free for pupils over a route of 12 miles, getting all of the pupils living in the direction traveled. The driver is paid \$75 a month, this small salary being possible through the fact that he has most of his time for himself.

The truck is left at the end of the route at night and the driver rides a

motor bike home, riding out to the truck in the morning. Then he leaves the truck at school during the day and comes back to it when school is out. This is cheaper than having him take the truck home with him. It makes one one trip a day, instead of two trips—a total of 24 miles a day. The truck is used to capacity and it saves the upkeep and expense of providing autos and horses for 40 separate children.

This truck is only an experiment, and a successful one. It is planned next year to put on two others like it, to cover the whole school district. The cost of the truck, complete, was \$4,300.

This school is doing fine agricultural work. The principal, G. N. Steyer, is the teacher of agriculture, and also owns a farm. There are 15 members of a very flourishing pig club, and 20 children extra in it from the grammar grades. According to J. A. Poytress,

a leading rancher of the district and a director of the Farm Bureau, this pig club work is one of the finest things ever used to develop agricultural interest among the children.

GIBLET SAUCE.

Pour off liquid in pan in which turkey or chicken was roasted. From this liquid, skim 5 tablespoons of fat, return to roasting pan and add 5 tablespoons of flour, stirring until smooth and brown; gradually add 3 cups of stock in which giblets were cooked. Stir until thick, season and add the giblets finely chopped.

DAZZLING DICKY.

"Such vivid neckties Dicky wears! They're simply dazzling."

"Yes, his idea seems to be 'Best is the tie that blinds.'"—Boston Transcript.

APPLE BUTTER.

The mere name of "apple butter" brings memories of that spicy, toothsome dainty which is old fashioned but which never goes out of fashion. As it holds the concentrated flavor of the apple, many people think it has no equal as a spread for bread or for serving with meats.

Almost any variety of apple will make good apple butter, but those of good quality which will cook well are most satisfactory.

Sometimes sweet apples are used with tart apples, the usual proportion being one-third of the former to two-thirds of the latter. Overripe apples do not make good apple butter, but if they are used, a little vinegar should be added to give snap to the butter. Only fresh, sweet cider or commercialized sterilized cider should be used; boil down to about half its original quantity.

The peeled and sliced apples may be cooked in the boiled cider to make the butter in one operation, or they may be made into apple sauce, which is then cooked in the boiled cider. With apples of coarse texture the latter method is preferable. Continue the cooking until the cider and apples do not separate and the butter when cold will be as thick as good apple sauce. Determine the thickness at frequent intervals by cooling small portions. About equal quantities of sweet cider and peeled and sliced apples are required to make butter of the right consistency. Five gallons of sweet cider should be boiled down to two and one-half gallons and five gallons of peeled and sliced apples should be added to it.

Two essentials of making good apple butter are long, slow cooking and constant stirring. Four to six hours are required for making the butter.

If sugar is desired in the butter add it after the cooking of cider and apples is about two-thirds finished. One pound of white or brown sugar to one gallon of apple butter is the usual proportion.

Spicing Apple Butter.

Apple butter is spiced according to taste, about a half-teaspoon each of ground cinnamon, cloves and allspice being used for each gallon. These are stirred into it when the cooking is finished. While still boiling hot, apple butter should be packed in hot boiled glasses, glass jars or hermetically sealed stone jars, with tightly fitting covers, and be boiled in steam as follows:

Place the containers, filled and with tops on, in a vessel fitted with a false bottom and deep enough to hold them. Pour in a little water, put on a cover to hold in the steam and place over the fire. Begin to count time when the steam starts to escape, and after five minutes for quart or smaller sizes, ten minutes for half-gallon sizes, and 15 minutes for gallon sizes, take the containers out to cool.

Place them away for future use. Do not disturb the covers until the apple butter is to be used. If covers do not fit tightly place wax or oiled paper in them to make a tight fit before boiling. The boiling prevents any molding, spoiling or infection of the top layer of apple butter and also takes the place of paraffin, which is now quite expensive.

VEGETABLE GARDEN TIME.

Fresh green things are always craved in the winter, and to have them then it is the right time now to plant such seed as lettuce, radish, beet, carrot, turnip and parsnip. Get the best seed possible, as it is such a loss of energy and time to work with poor seed.

WHAT HE LEARNED.

Mrs. Styles—"Did your husband get any decorations in the war?"

Mrs. Myles—"No; but he learned how to cook."—Yonkers Statesman.

A man down in Missouri put his hand in a mule's mouth to see how many teeth the mule had. The mule closed his mouth to see how many fingers the man had, and the curiosity of both man and mule was satisfied. We like to see everybody pleased.

Tractors or Horses—Ranchers' Estimates

Written for Pacific Rural Press by R. E. Hodges.

"What do you think of tractors for my place?" asked H. G. Hansen of Monterey county recently. Mr. Hansen raised 400 acres of barley and about 300 acres of beans this season on a granite loam upland farm practically level. He has farmed 40 years more or less, and he still uses horses for power. Magnificent animals they were as we watched two of the boys, each taking an eight-horse team to the field. Mr. Hansen is proud of them, for most of them are of his own breeding and he has understood that breeding.

"A horse is good for many years," said he, and when one is gone another has been raised to take its place. With a tractor I know people that have a lot of trouble and must buy an entirely new one about once in four or five years. That looks like it costs too much. But I don't know."

Neighbors' Experiences and Estimates.
To answer Mr. Hansen's question from experience under conditions similar to his own, we visited two of his neighbors who are farming similar acreages to the same crops. One is Chris Fanoe, whose new 22-45 horsepower tractor we had seen delivered a year ago last September. The other is a successful rancher, well known and highly respected in these parts for many years. He is H. P. Nielsen.

Mr. Nielsen works 400 acres, mostly in beans and grain. He keeps twelve horses busy or otherwise to handle the work; but he says it is cheaper to buy a horse than to raise one. A neighbor recently bought a good broken three-year-old for \$95, although Mr. Nielsen figures his own horses worth an average of \$150 each. The figures he gave us on the cost of farming by horses were not premeditated, but each of our readers can vary them to fit your own local experience. To estimate the cost per year of keeping and using his twelve work horses, he gave items about as follow:

Costs of Operation with Horses.

Interest on investment in horses (average \$150 @ 6%, 12 horses).....	\$108.00
Interest on investment in harness (six sets at \$40 per set)	14.40
Depreciation on horses (average working life 14 years)	128.57
Depreciation on harness (average life seven years)	34.28
Harness repairs	8.00
Losses by accident, disease, etc. (average one horse per year).....	150.00
Veterinary bills	50.00
Feed (50 ton barley hay, probably salable at \$10 per ton on the ranch unbaled as an average price for the past year)	500.00
Barley (five pounds per feed three times a day while working, say 250 days per year, 450 cents @ \$2.50, f. o. b. ranch)	1125.00
Pasture three months at \$3 per month while horses are idle	9.00
Care (probably 115 idle days, ½ hour per day at 25c per hour)	14.37
Drivers (Two at \$3 per day, 250 days)	1500.00
Total cost per year of keeping and using twelve horses	3641.56
Average cost per horse	303.46

Explanation of Estimates.

The fourteen years average working life of a horse is based on the practice of breaking them at two years old. Mr. Nielsen is working a horse now that is several years past fourteen. The seven years' life of harness and the harness repair bills are our own estimates in the absence of Mr. Nielsen's consideration of this point.

Losses by accident and disease were placed at one horse per year after recalling one year in which \$2,000 worth of horses died, one year in which only one died, and last year in which none were lost. Veterinary bills were vividly in mind at the time of our call, due to one of the horses being in hospital for a wire cut.

Feed runs high, as the rotation of crops enables Mr. Nielsen to keep the horses working almost every good day. Some hay is fed even when the animals are idly pasturing the acre lot containing a strawstack. Barley hay is fed because it is just a part of the home-grown crop. Its value, f. o. b. ranch, is taken because that is what it could be sold for if a tractor were used. It is unfair to base the

figures on its value at harvest time or after several months, so an approximate average valuation is placed by the writer on the amounts Mr. Nielsen feeds. Every reader may judge the fairness of these figures for his own ranch.

Tractor Replaces 22 Horses.

In order to make a fair comparison with tractors, it is necessary to figure the amount of work done as compared with a tractor. The operation of plowing will be a fair index for all operations. Mr. Nielsen uses six horses for three ten-inch bottoms or eight horses for four bottoms. This averages five inches of plow bottom per horse.

Mr. Fanoe emphatically maintains that his 22-45 h. p. tractor does as much work per day on the average as 22 horses could do, though this is true only on the larger operations of plowing and cultivating. At the rate and depth Mr. Nielsen's horses work, this would make the tractor plow 110 inches. But Mr. Fanoe gains something here. He pulls only 90 inches of plows; but he has 96 inches of harrow following to counterbalance the extra 20 inches that 22 horses would plow. The gain is in getting the ground harrowed immediately without any travel over its soft surface.

The past season's work for the tractor included plowing and harrowing 750 acres at the rate of 18 or 20 acres per day and cultivating 200 acres (for beans) three times with a battery of cultivators. This battery consisted of a ten-foot Killefer cultivator, followed by a ring roller and a harrow, each ten feet wide. This tractor certainly replaced the 22 horses on all work where that much power was adaptable.

Excess Power a Godsend.

Moreover, the excess power was a Godsend last year. On account of the flu, the plowing was started late and the day's work lasted from daylight to dark with noontime lunches eaten en route. Practically all greasing and oiling was done after dark. Each noontime the tractor was stopped just long enough to screw down a grease cup which could not be done while the engine was running. Mr. Fanoe was enabled to get his crops in in time whereas horses could not have stood the pace and at least three drivers would have had to be found in a time of labor scarcity. Finding the drivers would have been the least of his troubles, too. Keeping them would have been impossible on such a job. With the tractor there were no labor troubles.

Expenses as figured below are based on data given the writer by Mr. Fanoe as we rested beside the tractor, which had been carefully overhauled and sheltered after its season's work.

Cost of Keeping and Using Tractor.

Interest on investment (\$4,850 @ 6%)	\$291.00
Depreciation (see discussion below) ..	250.00
Repairs and overhauling	30.00
Driver (self, 70 days at \$5 per day) ..	350.00
Distillate, gas and oil (50c acre plowing, or 37½c acre cultivating or harrowing)	450
Total	\$1,371.00

The depreciation item is a surprise. We asked about this point particularly with questions recently asked by Mr. Hansen and others in regard to how often it would be necessary to buy a new tractor.

"I wouldn't take a price \$250 less than I paid for it. I consider my tractor practically as good as new," said Mr. Fanoe. "The tracks are not worn and there is every reason to believe that it will be good for five years. I took it down last spring after the plowing was done to see if it was worn. There has been no expense for repairs. We have just overhauled the engine and ground the valves, so it is ready for another year's work. I did most of the work myself and will do it all next time. I had an expert mechanic to help me this time and I suppose he will charge about \$15. The reason my tractor is

in such good shape is that I ran it myself and I always greased and adjusted it after dark while the machine was still warm and comfortable to handle. I've been careful to test occasionally for loose bearings; but the only ones found loose enough to take out a shim 5-1000ths of an inch thick were the end crankshaft bearings and one connecting rod bearing.

Mr. Fanoe's farm operations are more or less similar to those of Mr. Nielsen, and we can assume that his cost of keeping horses would have been the same. He was unready to give any estimate.

Big Money Saved Annually by Tractor.

Mr. Nielsen's cost of keeping and using horses was \$1.21 per working day. If Mr. Fanoe had rented 22 horses and used them at the same total cost per day for 70 days for the plowing and seedbed making, they would have cost him \$1,863.40 besides the worry of finding and keeping drivers and the risk of damage to horses and implements from careless or dissatisfied help.

The difference would be approximate—the difference between cost of keeping 22 horses (\$1,863.40), or keeping the tractor (\$1,371). At that rate, he will soon have more than he can spend and will buy another 500 acres in addition to the 500 he bought this fall.

Mr. Hansen, your neighbor, who once used horses as you do, tells us he is "tickled stiff" with the tractor and would quit farming if he had to do without it!

TRACTOR AND DISK TURN PRUNINGS INTO HUMUS.

On one of the older Valencia orchards near Lindsay, where the trees were planted only 20 feet apart, the branches for several years have been so near touching that a wagon could not be driven through the orchard and the fruit had to be hauled out on a sled. No sled large enough to carry the prunings properly could be used, so the manager had the prunings shoved under the branches of the trees, out of the way of cultivation.

That was not a satisfactory way of doing and after getting a tractor that would navigate between the trees, and putting a sharp, well weighted disc behind it, he had the prunings raked out into the middle of the rows. They were pretty brittle and aged by that time, so the tractor first crushed them down and then the disc cut them all to pieces and got them so they would make humus in due season. In this way the prunings, which formerly were a nuisance, became a soil improver.

Capacity for Work

Its great capacity for work makes the "Caterpillar" Tractor the most dependable and economical tractor for every purpose.

Capacity for work—ability to handle big loads regardless of ground or weather conditions, without miring, without packing the soil.

Capacity for work—day after day dependability; readiness to work day and night, if necessary; ability to give such service continuously without troubles or delays and with a minimum of expense for operation and up-keep.

"Caterpillar" capacity for work is the combined result of Holt selection and combination of materials, Holt workmanship and particularly of Holt design—developments resulting from more than a quarter century of tractor study and experience.

"Caterpillar" Tractor capacity has been proved scores of times for thousands of farmers everywhere. The War service of the "Caterpillar" Tractor proved it for the entire world.

The "Caterpillar" Tractor was the only tractor used by the Allies for their heaviest war service, selected after severe and prolonged tests. Buy your "Caterpillar" Tractor now. Send for Catalog 407.

For Nine Years

K-W equipped tractors have been increasing crop production and lowering crop costs.

Keep in mind when buying a tractor that upon the ignition system depends the performance of the motor, and no engine, however perfect, can deliver its maximum power UNLESS the spark from the magneto is hot enough to produce INSTANT and COMPLETE combustion of the carbureted gas within the cylinder.

K-W Magnetos are designed FOR TRACTORS and have made their reputation for reliability IN TRACTOR SERVICE all over the world. They produce the hottest known spark for ignition.

If you are not familiar with the K-W, ask some neighbor who is using one. He can tell you from his own experience, which will in turn show YOU why SEVEN out of every TEN tractors made use the K-W Magneto as standard equipment.

List of K-W equipped tractors and catalogs sent upon request.

Citrus Orchard Tractorists

(Written for Pacific Rural Press by D. J. Whitney.)

Orval Overall, President Kaweah Lemon Company, Lemon Cove, with 300 acres of citrus orchard: "We have two orchard tractors now with engines of 25 horsepower, and we intend to purchase two others before the spring work begins. We also intend to buy a powerful tractor of the track-laying type for the special purpose of sub-soiling the whole ranch deeply and doing other heavy work. Tractors have proved their worth with us as it is six years since we bought our first machine and we could not run the place right without them.

"Their greatest value for citrus work is during the spring rush. One shower is likely to follow another at frequent intervals in spring, leaving perhaps only four or five days between when the land can be worked. If horses alone could be used, they would cover very little ground in this space of time, but by having tractors available we can get the whole place worked up nicely before it gets too late. Tractors always give deep and thorough cultivation also.

"Horses will do a good deal of the work on this place, even after we have all the power machinery we expect to buy, but their use will be mainly in hauling brush and fruit and in cultivating the steeper hillsides where tractor work is inconvenient."

Chas. Goodale, manager of the Honora Realty Co., says that he would not know how to run an orchard without tractors. They have four orchard tractors now and do most of the cultivating on a 1000-acre ranch with them. A large part of the ranch is in citrus fruits. He says:

"Tractors beat out horses in economy, efficiency, and durability. A horse eats whether he is working or not! a tractor costs nothing when it is not used. As to efficiency, the hotter the day the better the tractor works, but if the day is very hot a horse may be wanting to rest all the time. During the hot summers here we need plenty of irrigation and thorough cultivation following it. As to durability, the tractor we bought three years ago seems as good as the one we bought a year and a half ago and the expense of upkeep is less than what it would take to feed and look after horses, doing an equal amount of work. Besides the hauling and various odds and ends of horse work needed about a place, we do our furrowing out with horses and pull in the furrows with them, but the tractor is the thing for heavy cultivation. Horses also are good for hillside work, particularly where the soil is light, for then, even if a tractor has lots of power, it cannot get a good foothold. Where the soil is heavy, as is the case on most hillsides in Tulare county, tractors can work on much steeper slopes than where the soil is a sandy loam.

"We are told that a rancher had better use horses on account of the fertilizing value of the manure; we are also told that we should keep tractors on account of the way they get the work done, but the way that tractors are coming in I do not know where the stable manure is coming from which all good citrus growers want for their trees. That is the main fault with the tractor. It provides neither manure nor colts. When a man's horses are worn out he can have a bunch of young stock from them to take their place, but when a tractor wears out, he has to go into his pocket to buy a new one. Even at that the tractor is the thing. If it could only have a young one every couple of years that was growing up while it was wearing out, it would be perfectly all right."

Chas. Howison, foreman of an 80-acre orange ranch at Lindcove, owned by James Madison, says: "We have used a tractor on the ranch for two years and can keep the soil in the finest kind of shape. Instead of a tractor packing the soil, as some claim, it seems to cultivate it, with the open work wheels of our tractor at least. Clods are crushed and weeds are cut by the tractor even before the tool we are dragging gets to them.

"By using a tractor with plenty of power a man can till the soil closer to the trees than he could with horses without the slightest danger of bruising the young fruit or hurting the trees. Then the tractor does such thorough cultivation that a man can keep his land in first-class shape.

VINEYARD TRACTOR QUALIFICATIONS.

Circumstances alter cases with tractors. In the Tulare citrus district tractors are becoming as numerous as tin Lizzies on a highway, for the soil is heavy enough to hold them up well and the trees are far enough apart to give plenty of elbow room. Not far off, on Fresno county vineyards, mostly with sandy soil, the user of a tractor is an exception.

There are several reasons for this. One is, particularly on the smaller vineyards, that the vineyards were planted with no thought of tractors and not enough space has been left to turn around nicely at the end of the rows. Next, the wear on the machinery is more on sandy soil than on clayey soil and vineyardists look for as dust proof, sand proof a machine as possible. Third, the lighter soil means harder pulling on round wheel tractors than they have on firm ground and in bad places they will dig themselves in. Consequently track-layer types are favored and they are more expensive than round wheel machines. They give full power on any soil, though, and never get stuck, so when required, justify a higher price.

One large and well known vineyardist near Fresno said this on the subject: "I do not feel by any means that we yet have the right tractor for vineyard work here (using reasons just given), but I have been using two or three on my vineyards and am putting a number more on. I can do this when men on small places might not on account of having too many turns. Since it is possible to go a mile straight on some of my ranches without turning, you can see what an advantage I have. For tractor work in vineyards I simply say: They are good when they can be used conveniently. Meanwhile the manufacturers should strive to give as much power as possible in as small a space as possible, and to make the machines as dust proof and sand proof as they can."

TRACTOR CLEARED 50 ACRES.

To use a tractor in pulling big bushes and small stumps ordinarily involves a lot of starting and stopping. One farmer with a 10-18 tractor cleared 50 acres in a more convenient way. He pulled about nine stumps without stopping, although he pulled only one at a time. Nine chains of various lengths were used. The longest was thirty feet. The rest were hooked to this one and around nearby bushes and stumps with varying amounts of slack. When the tractor started up, it tightened one chain at a time and dragged each stump until the rest were pulled.

POWER NOTES.

Pumps supplemented mountain water in the rice fields of the Oakdale (Stanislaus county) district and made the difference between big crops and ordinary or small crops.

A young lady who went down to pick prunes in Santa Clara county remained to drive a tractor at \$90 per month and board. Later on she may be working for her board and clothes, etc.

Fifty-eight new service stations have recently been added to those representing the American Bosch Magneto Corporation so that they now have nearly 300 in this country and over 30 in foreign countries.

A hundred-thousand-dollar contract, mostly for Killefer double disks to be used in rice fields, was recently closed with a Colusa dealer by G. A. Flood for the coming year. Last year's contract covered \$67,000 worth of implements.

THE REASONS *for* BEING PROUD

You'll be
proud to own either model
12-20 or 20-35
ready for immediate
delivery

Successful farmers; proud of their horses,
of the speed and grace of their two-year olds, of the weight
and stamina of their Percherons, were not satisfied with
plugs.

Successful farmers, proud of their Yuba tractor,
of its alloy steels and advanced design, of its ability to stand
up under hard service, of the soundness of their investment,
are not satisfied with any less perfect.

Successful farmers are not only proud of their Yubas
but they are a bit cocky about their own discrimination —
their intelligent appreciation of mechanical superiority.

Successful farmers like the feeling of being in good com-
pany —
the experts employed by big agricultural corporations de-
mand Yubas.

Successful farmers, with their Yuba tractors,
fear neither soil nor weather, neither strain of strenuous
season nor breakdown.

Write us fully about
your requirements; how
many acres you cultivate; the
crops you raise; the
nature of the
soil.

Experiences with Centrifugal Pumps

(Written for Pacific Rural Press by D. J. Whitney.)

It seems somewhat difficult to give in proper order various pointers about centrifugal pumps that should be known. Most of the facts given here were learned by experience at various intervals and the way they are given may be due partly to the way they were learned.

A very important item about the installation of a centrifugal, and also a rotary pump, is the design of the shed covering and protecting it. It seems very simple and natural just to put up an ordinary shed to cover it all. To do so in most instances is to prepare for a lot of unnecessary work and expense later, provided anything has to be done with the pump or well. The pump cannot be lifted out conveniently, or pipe pulled, nor sand pump lowered unless a derrick is erected over the well and this cannot be done without tearing the shed to pieces, and later putting it together again, and the way labor costs now, money is thrown away every time this is done. The proper idea is to erect the shed over most of the pit and machinery, but to have a lean-to a couple of feet off the ground, covering the well. Over this lean-to, with the center directly over the well, a permanent derrick of substantial timbers should be erected.

Then whenever it is necessary to pull up pump, motor, or pipe, a man can usually do it himself with the help of a hired man, without hiring a regular pump man, and the time and expense of preparing for the work is next to nothing. Or, if the pump men have to come out, they can start right in without erecting or removing the derrick and less time need be charged for. Sometimes a derrick is built over the shed when that covers everything. There is then some trouble with the roof every time pump or pipe has to be lifted, but the trouble is not large.

Foot Valves and Check Valves.

The older installations of centrifugal pumps have mostly foot valves, that is, valves at the bottom of the suction pipe to hold the water in the pump while the plant is not in operation. The newer and more convenient installations are valves at the elbow of the pumps. As the writer has had very little experience with these, he will not discuss them. Foot valves invariably, however, are noted for their tendency to leak, so that with rare exceptions it is necessary to pour water down the discharge before starting the pump, until the pump is full of water and the runner will get a grip on the water. Occasionally, with a very leaky valve, this is a hard job. Just as sand in a leaky bucket will stop leaks, so mud will block a leaky valve. When ordinary priming will not do, drop a small can of loose loam, or a chunk of clay, or something of the sort into the pump, and the priming will then be effective. On one very troublesome pump the writer used to drop in small particles of newspaper.

Depth of Suction.

Occasionally you hear it advised to have the suction deep in the well. This is bad business. The writer purchased a plant which had been installed in a place where there was no water and in the new installation 60 feet of suction was used. This brought the foot valve close to the bottom of the well, where sand filtering in partly checked it so that in time the water column was breaking and the limit of suction reached, while the water in the well was only 22 feet below the center of the pump. Inside the suction pipe, of course, it must have been 28 to 30 feet down. This was a waste of power and a strain on the pump, and there was trouble and expense in getting it fixed. Every foot of unnecessary suction or discharge means just so much more friction, even if the suction pipe is fully open at the bottom, and so much waste of power. Put on as much suction as is needed and no more. The limit of need is about 35 feet, and if a man is sure of his well he can use

less. The reason why 35 feet may be good even though the working limit of suction on an ordinary centrifugal is about 25 to 28 feet is that air may get into the suction if the inlet is too close to the surface and cause the water column to break and pump to run free and dry. Therefore, have the suction a little lower than you ever expect the water to drop down. Furthermore, the larger the suction and discharge pipes, the less power will be needed for a satisfactory flow.

Packing a Centrifugal.

A centrifugal pump has to be airtight. The natural leak is where the runner shaft enters the pump shell. The nearer the pump is to the water the less the strain on packing and the less strain on the bearings, so keep the pump as near the water as possible. Deep suction is a heavy strain on the packing.

The popular packing in this section seems to be braided hemp well mixed with graphite—graphite packing, it is called here. The writer, however, prefers asbestos packing, using it in long, thin strips, heavily covered with graphite grease, which is far prefer-

able to ordinary motor grease. This gives excellent satisfaction. Loose hemp is poor stuff if there is any strain upon it. When packed too tight it will simply burn, leak, and air will enter. The asbestos packing is wrapped around the shaft the way the runner turns, otherwise the shaft might loosen it.

When the pump was installed a grease cup was used over the packing, but trouble lead to the discovery of a better way which is fairly common and ought to be universally used. It is cooling by water, not grease. Water will always keep a bearing, or packing cool; grease may not.

Water Seal.

From the top of the runner shell have a small pipe come up and lead over to the water bearing of the pump. The motion of the runner forces water through this pipe, and instead of sucking air through packing, the tendency will be for this water to take the place of the air, though of course, loose packing will make the pump leak air anyway and the water seal will be useless. Also have a small cut-off on an arm of this pipe and have a short piece of garden hose leading from it to the place where the grease cup is used. A piece of pipe on the end of the hose takes the place of the grease cup. The cut-off should

then be adjusted so that the faintest trickle of water will pass to the packing, which it will keep cool under all conditions, preventing excessive wearing of the shaft and the sucking of air, provided the packing is in good shape. Sand in the water may cut the shaft, but a sand trap can be used and the adjustment of the cut-off to make a small, slow flow will help also. If pump and motor get out of a straight line it wears the shaft badly. A well adjusted plant will run smoothly, so if your pump begins to make a noise, line it up again. Put a block under your discharge also, as this may keep the weight of water in the pipe from pushing the pump out of line.

A few words about ordinary horizontal centrifugal pumps may be said here. The typical pump of this kind has the water come in at the center on one side, while power is applied from the other side on runner shaft. This causes a side strain on shaft and runner, which can be offset or over come in various ways. There are some pumps so well water balanced that this strain is hardly noticed. Others are not so well balanced. There are closed runner pumps and open runner pumps, but these are technical matters which need not be described.

Fairbanks-Morse
"Z" Engine with
Bosch Magneto

SINCE the "Z" was put on the market, over 250,000 farmer buyers have pronounced it the greatest farm engine value. ☐ We felt the same way about it. ☐ But following our policy to improve our product whenever possible, we are highly pleased to announce a new

FAIRBANKS-MORSE "Z"

with Bosch Magneto—high tension ignition which adds the one possible betterment. ☐ Call on the "Z" dealer near you—see this world's greatest engine—understand the full meaning

for you of the engine service which over 200 Bosch Service Stations give, in co-operation with every "Z" dealer, to every "Z" engine buyer. ☐ Prices—1½ H.P. \$75.00—3 H.P. \$125.00—6 H.P. \$200.00—All F. O. B. Factory.

MANUFACTURERS CHICAGO

Cletrac

TANK-TYPE TRACTOR

(Formerly known as the Cleveland Tractor)

No "Off Season" for the Cletrac

THERE is no "off season" for the Cletrac. It is a season 'round investment—paying you a steady interest 365 days in the year.

When it is not necessary in the fields, it never need be idle. For it is a master at belt work and knows no equal at dragging dead weight.

Grade with the Cletrac. Haul with the Cletrac. Use it to pull your logs and stone boats. Saw with it. Run the feed mill with it. Let it do *all* the work that you formerly did with your stationary engine and horses.

And then when it comes time for field work again remember that the Cletrac *does far more than merely plow*. It is the one tractor that successfully goes through with the *entire preparation of the seed bed*—plowing, harrowing, planting—*without sinking in—without packing down the soft earth*.

No power wasted

The Cletrac runs on metal tracks like a locomotive. No extra power is required to push it *through* the soil. It rides on its tracks *on top of the ground* and consequently most of the power goes *into drawbar pull* where it should go.

This track-laying, tank-type of construction permits the Cletrac to go over uneven ground, soft sandy soil,

and even the muck of the Southern rice fields without slipping, sliding or floundering. It permits side hill work ordinarily considered dangerous for tractors.

It is ideal for orchard work

Because of its small size, its short turning radius and its power, the Cletrac has become the standard tractor among orchardists.

The Cletrac operates on a very small amount of distillate, kerosene or gasoline. It does *more* work, *more* days in the year and does it *better, cheaper* and *faster*.

Every Cletrac dealer is a service man. When you buy a Cletrac, you are assured of a service fully in keeping with the excellence of the machine—a service backed by The Cleveland Tractor Company itself—a service that is prompt, courteous, efficient and economical.

Order your Cletrac *now* for prompt delivery. Cash in on it *now*. Have it ready for field work when the time comes.

Write today for a copy of our interesting thirty-two page illustrated booklet "Selecting Your Tractor." It gives you in addition a rich fund of information on every phase of the tractor situation.

The Cleveland Tractor Co.

19079 Euclid Avenue

Cleveland, Ohio

The largest producers of tank-type tractors in the world

SMALL COMBINED HARVESTER FOR RICE.

The small combined harvester and thresher operated by two men has become very popular in California. But a new one on this machine is the use being made of it by a Butte county rice grower. This man does not haul his rice to the thresher, but hauls his small combined harvester around the rice field and handles the rice bundles only once. Four or five men are needed to keep it busy. The platform has been taken off and a stationary threshing-machine self-feeder has been put on for the rice. It turns out over 300 sacks per day and leaves straw spread over the field where it does the most good.

COMMUNITY SILAGE EQUIPMENT.

Co-operation has solved the farm labor shortage for a group of seven ranchers in the vicinity of Tulare. When the men, C. O. Martin, Sam Burgan, H. E. Martin, Henry Beckman, M. B. Crossley and B. M. Hargis, found it impossible to secure labor for their ranches they held an informal meeting, selected Mr. Riley secretary and Albert Martin as manager, named their organization the Tulare Silo company and proceeded to build a silo on each place, each man putting up his own. Then the group purchased a 45 horse power gas engine, mounted on a truck, an ensilage cutter and a corn binder. Twelve men are necessary to operate the machinery, the seven members of the company forming the nucleus of the crew. The company has between its members some 80 acres of excellent Indian corn.

BEETS FROM WAGON TO CAR.

Many are the devices intended to make it easier to unload sugar beet from wagon to freight car. At one place we recently saw them being hauled with eight horses per wagon to the "dump," where the whole load would be off in less than two minutes from the time the horses stopped. wagon bed has a steep inverted V-shaped bottom and sides hinged along their top edges so their lower edges could swing outward when released. They were held in place by a ratchet, which was disengaged with a small bar to dump.

A bin under the platform extended on both sides to receive the beets. Its bottom sloped steeply to the point where a vertical bucket-conveyor dipped them up. This carried them to the top of a chute whence they slid into the car. The floor of the chute was slatted to let dirt and some loose leaves through. It had hanging gates at intervals to break the fall of the beets. At its lower end were flaring sides which prevented the beets from falling off the car while the latter was being heaped up. It was loaded at one end and shoved along by a man with a pinchbar as it filled up.

SHOW MANAGERS TO MEET.

Chas. R. Thomas, manager of the Los Angeles Live Stock Show and G. H. True of the San Francisco Show agreed this week to call a meeting of Livestock show managers to be held at San Francisco, January 5th next. The states to be represented in the conference are Washington, Oregon, Idaho, California, Nevada, Montana, Utah, Arizona and Nevada. The object of the meeting is to arrange for a circuit of show dates covering the western territory.

As a wise man goes to his banker for advice on business affairs, so a motorist may well go to lubrication experts for suggestions. The Standard Oil Co. maintains a Board of Lubrication Engineers, who have prepared a chart showing their recommended lubrication for every type of car. This chart is free for the asking.

A system of lubrication, by which grease is forced into all bearings conveniently with no loss of time is the Alemite, exhibited at the Los Angeles tractor demonstration. A nipple containing a spring and ball to close its opening is screwed on in place of each grease cup. On its side are points

over which it is the work of an instant to hook the end of a flexible tube from a grease pump, so tight that 400 pounds pressure exerted by the screw on the pump forces grease past the ball into the bearing but does not waste any of it.

BOY RUNS ORCHARD TRACTOR.

One of the interesting features at the Los Angeles tractor demonstration was a boy eleven years old driving a 12-20 track-type tractor and double disk in and out among stakes set 18 feet apart to represent an orchard. The boy is Honore Griffen of Los Angeles county. During the past season Honore did most of the work on 40 acres of oranges on rocky land without barking a tree.

The friction-drive on a small tractor operated by an orchardist in Orange county slipped and wore out in a year so it had to be replaced. That orchardist is not a booster for friction-drive tractors, and he wants to sell this one at half-price. It stands idle now while horses do the work.

PROTECT FOREST SETTLERS AGAINST DEER!

To the Editor: As crop reporter in this section, and in behalf of my neighbors, I am writing the following to the Secretary of Agriculture and the State Fish and Game Commissioners:

Several of the neighbors have, within the past two years, planted young orchards of apples, prunes, almonds, etc. Without exception, these orchards have promised well, but for one drawback—and that is the deer. They go about when the orchards first leaf out, and eat off the tender sprouts and leaves, and in some cases, even the bark. During the time the deer horns are losing the velvet, the bucks assault the larger trees and whip them to pieces, often ruining them entirely, not only by breaking them, but by knocking off the buds and grafts. They also cause much damage by shaking off fruit while green in the older orchards. When standing on their hind legs they are much taller than a man, and break off many limbs in that way. Field

crops of corn, beans, potatoes, and the like, suffer largely on their account.

Placing a shake box around each of the small trees has been tried by some of the orchardists, but to no avail. Besides, this is expensive. The ordinary fence is no protection whatever, less than six or seven feet high; and this is also expensive, especially for people just starting out. As you no doubt are aware, these deer are protected by law. And even if they were not, the people here do not like to kill them, nor do they begrudge them their feed, if they could be kept out of serious mischief. Is there no way of helping them out, by the government at least providing the fence to keep out its own proteges from encroaching upon the rights of the citizens? People are surely entitled to as much protection as deer.—M. F. Still, Crop Reporter, La Panza.

This is a very old trouble, recently greatly exaggerated by the protection of the deer. The proposition of protection to farmers should be agitated until the public has better understanding of it.—Editor.

Built to meet the work—not to meet a price

Sun-up— and on the Job

IN the rush times, when every moment is precious, from sun-up to sundown, TWIN CITY tractors and threshers are ready to go. They are built that way.

Dependable TWIN CITY design is well shown in the 12-20 motor—a 16-valve-in-head, 4-cylinder engine.

The double valve capacity burns the kerosene charge so cleanly that carbon clogging, pre-ignition and overheating are eliminated. A finely counterbalanced crankshaft (drilled for force-feed lubrication) reduces the "whip" of vibration to harmlessness. Cylinder sleeves are removable—re-boring is never necessary.

Rated at 20 horse power, this engine delivers an unusual surplus of power at its normal speed of 1,000 r. p. m. Its power reserve is on a par with its reserve endurance.

And the TWIN CITY spur-gear transmission is as far in advance of the times as is the engine—with its direct drive on both forward speeds, its steel cut and case hardened gears completely enclosed and running in oil, mounted on Hyatt roller bearings.

There is TWIN CITY power for all farm work on any size farm. So write us today for booklets and complete information concerning the tractor and thresher that fit your needs.

Duroc-Jersey Show Awards.

To F. M. Johnson of Napa, Cal., went the highest honors to be won when his great boar, King Orion Jr., was awarded grand championship honors in the Duroc-Jersey swine division, while to Conejo Ranch, Newbury Park, Cal., went the grand championship female honors on Grand Lady 66th. These two animals were the outstanding features of the Duroc show. In numbers and quality the senior sow pig class was a show in itself, as no show this year has brought out so many real outstanding animals as was found in this class, the blue finally being awarded to Conejo Ranch on Lady Wonder 1st. While other shows in the State have had a larger number of entries, no show ever held on the coast has produced a greater number of animals exhibiting the class

THOS. HARRISON - And Dual Purpose Shorthorns.

and quality found in this one. Following are the awards made by Prof. H. H. Kildee of the Iowa State College, Ames, Ia.:

Boar 2 years old or over—1st, F. M. Johnson, Napa, Cal.; 2nd, Harvey M. Berglund, Dixon, Cal.; 3rd, Roy Fisher, Lincoln, Neb.

Boar senior yearling—1st, Conejo Ranch, Newbury Park, Cal.

Boar junior yearling—1st, Conejo Ranch; 2nd, Roy Fisher; 3rd, Jersey Queen Farm; 4th, S. E. Whiting, Sacramento; 5th, J. H. Rosseter, Burke, Cal.

Boar senior pig—1st, Conejo Ranch; 2nd, Roy Fisher; 3rd, S. E. Whiting; 4th, Roy Fisher.

Boar junior pig—1st, Western Laboratory Serum Farm; 2nd, 3rd, Conejo Ranch; 4th, 5th, J. E. Thorp, Lockford.

Sow 2 years old or over—1st, Conejo Ranch; 2nd, 4th, J. E. Thorp; 3rd, Jersey Queen Farm; 5th, Harvey M. Berglund.

Sow junior yearling—1st, Conejo Ranch; 3rd, 5th, Roy Fisher; 4th, J. E. Thorp.

Sow senior pig—1st, 2nd, 3rd, Conejo Ranch; 4th, J. E. Thorp; 5th, S. E. Whiting.

Sow junior pig—1st, J. E. Thorp; 2nd, 3rd, 4th, Conejo Ranch; 5th, S. E. Whiting.

Senior Champion Boar—F. M. Johnson on King Orion Jr.

Junior Champion Boar—Conejo Ranch on Big Model.

Senior Champion Sow—Conejo Ranch on Grand Lady 66th.

Junior Champion Sow—Conejo Ranch on Lady Model 1st.

Reserve Grand Champion Boar—Conejo Ranch on Big Model.

Grand Champion Sow—Conejo Ranch on Grand Lady 66th.

Reserve Grand Champion Sow—Conejo Ranch on Wonders' Bell.

Boar and 3 sows 1 year old and over—1st, Conejo Ranch; 2nd, Roy Fisher; 3rd, J. E. Thorp.

Boar and 3 sows under 1 year old—1st, 3rd, Conejo Ranch; 2nd, J. E. Thorp.

Boar and 3 sows, bred by exhibitor—1st, J. E. Thorp; 2nd, Harvey M. Berglund.

Four animals of either sex, any age, get of one boar, owner by exhibitor—1st, 2nd, Conejo Ranch; 3rd, Roy Fisher.

Four animals of either sex, any age, produce of one sow, owned by exhibitor—1st, 3rd, Conejo Ranch; 2nd, Roy Fisher.

SALE EXTRAORDINARY!!

Circumstances over which I have no control force me to sell now instead of next Spring, as I intended, fifty head of

Registered Poland-China Hogs

consisting of a few bred sows and boars, all the rest are open gilts, just ready to breed for March litters. This is by far the choicest bunch of pigs I have ever owned. The cream of the East and West in breeding.

I surely hate to part with them, but my loss is your gain.

SALE ON

SATURDAY, NOVEMBER 29, 1919,

At King's County Fair Grounds,

HANFORD, CALIF.

Free lunch at 11:30.

Sale begins at 12:30. Everybody come.

PURE HAWAIIAN CANE MOLASSES**PORK PRODUCTION**

By actual test will increase pork production five-tenths pounds daily over a barley and tankage feed, yet it sells for less than half the price.

MILK PRODUCTION

One of our customers writes: "We are out of molasses and our cows are falling off in their milk badly, hence we would appreciate immediate shipment. Kindly ship us two tons more in addition."

We supply it in barrels or tank cars for shipment anywhere.

Attend the California International Livestock Show, San Francisco, November 1 to 8.

FARMERS and ORCHARDISTS

Get Together!

We offer you an Immediate
and Inexpensive solution of

YOUR POWER PROBLEMS

through participation in our

Co-operative Plan

Here is
Our Offer

What one man cannot accomplish by himself, he achieves by joining with others. HERE IS OUR PLAN. Get in touch with five or six men like yourself; farmers who need power, but who have not sufficient land to keep a farm tractor busy. We will not only sell one of the best, most practical, all-round tractors to yourself and friends buying in a group, but we sell it to you on

EASY TERMS AT DIRECT-FROM-FACTORY- TO-YOU PRICES

You will get all the power you need at a VERY SMALL COST and you can spread this small expense over a number of months. Our plan calls for only \$100.00 down and \$25.00 per month on our co-operative plan.

You cannot be a successful farmer unless you adopt modern methods. The farm tractor is one of these.

Write us for Full Particulars

Give us the names of your friends who may join with you. We will send them details about our plan without mentioning your name. DO IT NOW! and get your tractor in time for this season's plowing.

REPRESENTATIVES

WANTED We want reliable men to represent us in every district and will pay good money to men who will take this exceptionally liberal Co-operative plan direct to power users. Only reliable, trustworthy men wanted. Send references with your inquiry.

San Francisco, Calif.

Chester White Choice Ones.

Although the Chester White show was made up exclusively by C. B. Cunningham, owner of the Billiken herd at Mills, Cal., it was a creditable representation of this breed, according to V. F. Dolcini of Davis, Cal., who placed the awards. Cunningham had some excellent specimens of the breed and his winnings would probably have been almost as good a walk-over had he had competition.

The awards are as follows:

All awards to the Billiken herd owned by C. B. Cunningham, Mills, Calif.

Cunningham and Chester Whites.

Guernsey Awards.

The Guernsey show was a walk-over for A. B. Humphrey of the Grape Wild Farm of Escalon, Cal., carrying away the major portion of the awards on his string of cattle that are winding up a strenuous show season.

Judge J. B. Fitch of Manhattan, Kansas, spoke highly of the Guernsey show. Even though not as strong in numbers as some of the other breeds it was strong in quality.

L. D. Smith of Berkeley made a creditable showing although his string of cattle was not as large as that of Humphrey.

The complete Guernsey awards are as follows:

Bull, 3 years old or over—1st. A. B. Humphrey, Escalon; 2nd. L. D. Smith, Berkeley.

Bull, 2 years old and under 3—1st. Humphrey; 2nd. Smith.

Senior yearling bull—1. Humphrey; 2nd. Smith.

Senior bull calf—1st. Humphrey; 2nd. Smith.

Junior bull calf—1st. Humphrey; 2nd. Smith.

Cow, 4 years old or over—1st. Smith; 2nd. Humphrey.

Cow, 3 years old and under 4—1st. Smith.

Cow, 2 years old and under 3—1st. Humphrey; 2nd. Smith.

Senior yearling heifer—1st. Humphrey; 2nd. Smith; 3rd. Humphrey.

Junior yearling heifer—1st. Humphrey; 2nd. Smith.

Senior heifer calf—1st. Humphrey; 2nd. Smith; 3rd. Humphrey.

Junior heifer calf—1st. 2nd. Humphrey; 3rd. Smith.

Cow having official yearly record begun under the age of 5 years: 1st. Smith; 2nd. Humphrey.

Senior Champion Bull—Humphrey, on Escalon Challenger.

Junior Champion Bull—Humphrey, on Escalon True Type.

Senior Champion Cow—Humphrey, on Escalon Fairy.

Junior Champion Heifer—Humphrey on Escalon Evangeline.

Grand Champion Bull—Humphrey, on Escalon Challenger.

Reserve Grand Champion Bull—Humphrey on Escalon True Type.

Grand Champion Cow or Heifer—Humphrey on Escalon Fairy.

Reserve Grand Champion Cow or Heifer—Humphrey on Escalon Bo-peep.

Aged Herd—1st. Humphrey; 2nd. Smith.

Young Herd—1st. Humphrey; 2nd. Smith.

Calf Herd, bred by exhibitor—1st. Humphrey; 2nd. Smith.

Four animals, either sex, get of one sire—1st. Humphrey; 2nd. Smith.

Two animals, either sex, produce of one cow—1st. Humphrey; 2nd. Smith.

Ayrshires Are Numerous.

Although confined to two herds, the Ayrshire show was one of the strong features of the cattle division of the California International, bringing out a fine lot of cattle. Prof. H. H. Kildee, of Manhattan, Kans., who placed the awards, said that it was seldom his pleasure to go down the line on better classes of cattle.

J. Henry Meyer of San Francisco and Watsonville put over most of the championship awards, but his win-

nings at other fall shows were slightly disarranged when Holshouse Secretary Imp. was dropped to reserve champion and the senior bull calf, Elkhorn Public Opinion, given the premier male award.

E. B. McFarland of the Steybrae Ranch of San Mateo carried off a good measure of awards, particularly in the 2-year-old female class, winning all awards except fourth. McFarland moved in on the purple with the junior champion heifer. The University of California was an exhibitor only in the produce of cow class with a winning.

The Ayrshires were placed as follows:

Bull, 2 years old and under 3—1st. J. H. Meyer & Co., San Francisco, Cal.; 2nd. E. B. McFarland, San Mateo, Cal.

Senior Bull Calf—1st. 3rd. Meyer; 2nd. McFarland.

Junior Bull Calf—1st. Meyer; 2nd. 3rd. 4th. McFarland.

Cow, 4 years old or over—1st. 4th. 5th. Meyer; 2nd. 3rd. McFarland.

Cow 3 years old and under 4—1st. 2nd. McFarland; 3rd. Meyer.

Cow 2 years old and under 3—1st. 3rd. 4th. 5th. McFarland; 2nd. Meyer.

Senior Yearling Heifer—1st. 3rd. Meyer; 2nd. McFarland.

Junior Yearling Heifer—1st. 2nd. McFarland; 3rd. Meyer.

Senior Heifer Calf—1st. Meyer; 2nd. 3rd. 4th. McFarland; 5th. University of California.

Junior Heifer Calf—1st. 3rd. McFarland; 2nd. Meyer; 4th. Univ. of Calif.

Senior Champion Bull—Meyer on Holshouse Secretary Imp.

Junior Champion Bull—Meyer on Elkhorn Public Opinion.

Senior Champion Cow—Meyer on Highland Ithian.

Junior Champion Heifer—McFarland on Burnside Miss Courtney.

Grand Champion Bull, any age—Meyer on Elkhorn Public Opinion.

Reserve Grand Champion Bull, any age—Meyer on Holshouse Secretary Imp.

Reserve Grand Champion Cow or Heifer, any age—McFarland on Burnside Miss Courtney.

Aged Herd—1st. Meyer; 2nd. McFarland.

Young Herd—1st. McFarland.

Calf Herd, all bred by exhibitor—1st. 2nd. McFarland.

Four animals, either sex, get of one sire—1st. 2nd. 3rd. McFarland.

Two animals, either sex, produce of one cow—1st. McFarland; 2nd. Meyer; 3rd. University of California.

Dairy Herd, consisting of 5 cows in milk, all to be owned by exhibitor—1st. McFarland; 2nd. Meyer.

Milking Shorthorn Show Excellent.

Two of the great herds of the State were lined up in competition. Alexander & Kellogg of Suisun carried off both grand championships, although there are those who are making a study of this strain of Shorthorns who think that Westward Ho is rather too beefy in type for the best example of the breed. There is some difficulty in getting judges who have made a specialty along dual-purpose lines.

Thos. Harrison of Santa Rosa carried off first honors in aged bulls

Sheep, Shorthorns and Shetlands.

on Foothills Pioneer, senior bull calf, and senior heifer calf classes.

Altogether it was a great showing of the breed that furnishes milk in abundance and of excellent quality and steers that top the market.

Awards follow:

Bull, 3 years old or over—1st. Thos. Harrison, Santa Rosa, Calif., on Foothills Pioneer;

2nd. Leon F. Douglas, San Rafael, Calif.

Bull 2 years old and under 3—1st. Alexander & Kellogg, Suisun, Calif., on Westward Ho.

Senior Bull Calf—1st. Harrison.

Junior Bull Calf—1st. 2nd. Alexander & Kellogg.

Cow, 3 years old or over—1st. 2nd. Alexander & Kellogg.

Cow, 2 years old and under 3—1st. Harrison; 2nd. Alexander & Kellogg.

Senior Yearling Heifer—1st. 2nd. Alexander & Kellogg.

Junior Yearling Heifer—1st. 2nd. Alexander & Kellogg.

Senior Calf—1st, Harrison; 2nd, Alexander & Kellogg.
 Junior Heifer Calf—1st, Alexander & Kellogg; 2nd, Harrison.
 Senior Champion Bull, 2 years old or over—Alexander & Kellogg on Westward Ho.
 Junior Champion Bull, under 2 years old—Alexander & Kellogg on Inisfail Favorite.
 Senior Champion Cow, 2 years old or over—Alexander & Kellogg on Bellevue Daisy.
 Junior Champion Heifer under 2 years old—Alexander & Kellogg on Valley Bell 6th.
 Grand Champion Bull—Alexander & Kellogg on Westward Ho.
 Reserve Grand Champion Bull, any age—Alexander & Kellogg on Inisfail Favorite.
 Grand Champion Cow or Heifer, any age—Alexander & Kellogg on Valley Bell 6th.
 Reserve Grand Champion Cow or Heifer, any age, Alexander & Kellogg, on Valley Bell 6th.
 Aged Herd—Alexander & Kellogg.
 Young Herd—Alexander & Kellogg.

Shorthorn Awards.

Judge W. H. Pew of Ravenna, Ohio, judge of Shorthorn cattle, pronounced the show of this breed one of the best he had ever judged and one of the best ever made in America. Judge Pew is a famous breeder of Shorthorns and a judge of international reputation.

The complete Shorthorn awards follow:

Bull, three years old or over—1st, Estate of Thos. B. Dibblee; 2nd, Henry Elberg, Woodland; 3rd, William Henn, Kansas City, Mo.
 Bull, 2 years old and under 3—1st, Caledonia Farms, San Francisco; 2nd, Pacheco Cattle Co., Hollister; 3rd, T. S. Glide, Davis.
 Senior Yearling Bull—1st, Dibblee Estate; 2nd, Elberg; 3rd, Pacheco Cattle Co.; 4th, Henn.
 Junior Yearling Bull—1st, 2nd, Thomas Miller, Hollister; 3rd, William A. Bond; 4th, Henn; 5th, Ormondale Co., Redwood City.
 Senior Bull Calf—1st, 2nd, Miller; 3rd, Dibblee Estate; 4th, Glide; 5th, Pacheco Cattle Co.
 Junior Bull Calf—1st, University of California, Davis; 2nd, Glide; 3rd, Pacheco Cattle Co.; 4th, Ormondale Co.
 Cow, 3 years old or over with calf at side nursing—1st, Glide; 2nd, Ormondale Co.
 Cow, 2 years old and under 3—1st, Glide; 2nd, Dibblee Estate; 3rd, Pacheco Cattle Co.; 4th, Elberg.
 Senior Yearling Heifer—1st, Glide; 2nd, 3rd, 4th, Dibblee Estate.

Cebrian of Caledonia Farms.

Junior Yearling Heifer—1st, Elberg; 2nd, 3rd Ormondale Co.; 4th, Glide; 5th, Bond.
 Senior Heifer Calf—1st, 4th, Pacheco Cattle Co.; 2nd, Glide; 3rd, Dibblee Estate; 5th, Junior Heifer Calf—1st, Pacheco; 2nd, Elberg; 3rd, Bond; 4th, Glide; 5th, Dibblee Estate.
 Senior Champion Bull—Caledonia Farms, on Gainsford Matchless.
 Junior Champion Bull—Dibblee Estate, on Bashan Augusta.
 Senior Champion Cow—Glide, on Little Sweetheart.
 Junior Champion Heifer—Glide on King's Countess.
 Grand Champion Bull—Caledonia Farms, on Gainsford Matchless.
 Reserve Grand Champion Bull—Dibblee, on Bashan Augusta.
 Grand Champion Cow or Heifer—Glide, on Little Sweetheart.
 Reserve Grand Champion Cow or Heifer—Glide, on King's Countess.
 Aged Herd—1st, Dibblee Estate; 2nd, Glide; 3rd, Elberg; 4th, Pacheco Cattle Co.
 Young Herd—1st, Glide; 2nd, Pacheco Cattle Co.; 3rd, Ormondale Co.
 Calf Herd—1st, Dibblee Estate; 2nd, Glide; 3rd, Pacheco; 4th, Miller; 5th, Pacheco.
 Four animals, either sex, get of one sire—1st, Ormondale Co.; 2nd, Pacheco; 3rd, Glide; 4th, Dibblee; 5th, Miller.
 Two animals, either sex, produce of one cow—1st, Dibblee; 2nd, Glide; 3rd, Bond.

Awards in Aberdeen-Angus Classes.

Although the breeding classes of Aberdeen-Angus were shown only by one exhibitor, the interest in the "Doddies" was as keen as though there was active competition. Congdon & Battles of Yakima, Wash., who were the only ones showing in the breeding classes with this breed, won a lot of admirers for the black ones. The feature of the judging was the upset given the lining up of awards on this herd from the manner in which they were placed at other shows up and down the Pacific Coast. Alex

McDonald, the veteran beef herdsman of the University Farm at Davis, Cal., made the senior yearling grand champion female, whereas at all other shows the two-year-old came in for the purple, and all the other beef cattle authorities about the ring concurred in McDonald's judgment.
 The awards in this class follow:
 All awards to Congdon & Battles, Yakima, Wash.

Draft Horses to the Front.

"While I have judged larger classes of draft horses out here, I have not seen a more creditable lot of real good quality stuff than what has come into the ring in this show," said Dean C. F. Curtiss, of Ames, Ia., in commenting upon the draft horse show at the California International. "The high standard of excellency went on through with the different

MARK BASSETT.

Bassett Believes in the Poland-Chinas.

breeds. The Dibblee Clydesdales were a high class lot. The Percheron stallion was an exceptionally good one and the Belgians were a credit to the breed. The Blackhawk pair of mares shown under heavy harness were good enough to go into any show ring in the country, and the gray Percherons of the University of California were of exceptional excellence."

Draft horse breeders were highly pleased with the interest taken in their show, and the following around the judging rings was keen on all the different breeds. One of the strong features of the heavy horse department was the showing of the Ratto Stock Farm of Napa that took away both grand and reserve championships in the mare classes.

The draft horses under harness were featured frequently during the special Night Horse Show, attracting admiration from thousands.

The complete awards for drafters follow:

English Shires.

Stallion, 4 years old or over—1st, 2nd, 3rd, Easton & Ward, Diablo, Calif.

(Continued on page 698.)

How You Dread Wash Day!

WE are talking to you, Mrs. Farmer. And we want to help you. You have the meals to get for the men folks on wash day the same as every other day—and there are the children to be looked after as usual, as well as your regular housework and chores. Even without these added tasks, the family wash is usually enough to break any woman's back and to wear her out generally. Working in the fields and around farm machinery makes dirty clothes—as you well know.

An International Kerosene Engine—1½-h. p. size—will take the hard work and backache out of the family wash for you as well as removing all of the dirt just as efficiently as you could do it yourself. You need a power washer and one of these little engines just as much as your husband needs a mower or grain binder. He doesn't cut the hay and grain with a sickle or scythe—modern machinery has taken the hard work and backache out of these tasks for him. So you are certainly entitled to an engine and power washer to do as much for you.

And between times the engine will churn the butter, turn the cream separator, shell corn for the chickens, turn the grindstone, pump water, saw wood and handle other chores, saving work for the whole family. Write for a descriptive catalogue so that you can show your husband just the engine you want. There are three sizes—1½, 3, and 6-h. p.

THE IDEAL MACHINE FOR FARM USE, SILO BUILDING, FOUNDATION and GUTTER WORK

HARRON, RICKARD & McCONE

SAN FRANCISCO

LOS ANGELES

Calif. Shorthorn Breeders' Assn. Sale.

A fitting place for a cattle sale! Plenty of room alike, for spectators, buyers and cattle! Plenty of light without shadow, and air without drafts, made the California Building at the California International Livestock Show an ideal place for holding the Shorthorn Sale of the California Shorthorn Breeders' Association, November 6, 1919.

Consignments from several of the prominent herds of the Pacific Coast made up a bunch of cattle of excellent breeding and type, many of which brought good prices, although the sale could not be called a sensational one.

The top of the sale was the red yearling heifer, Willow Brook Maid, consigned by Caledonia Farms, San Francisco, and going to Geo. C. Dier-son of Sacramento, who is establishing a fine herd of Shorthorns.

The white yearling bull, Orden's Sultan, consigned by Thos. T. Miller of Hollister, was bought by Wm. T. Chapple, Fair Oaks Ranch, Willits. At one time it looked as though this bull was going to the \$1,000 mark or beyond.

The average for the 25 females sold was \$458; and the 6 bulls brought an average of \$610.

The cattle were distributed widely, several going to the Warren Creek Land & Live Stock Co., Wells, Nevada; some to Fresno, Willits, Clements, and quite a number to Sacramento. In fact, the firm buying the largest number was Edinger-Johnson Co. of the latter place.

Details of the sale follow:

Females.	
Ramona Miss, W. O. Blasingame, Fresno	\$370
Caledonia Glen, T. S. Glide, Davis	200
Ormondale Violet, O. B. Fuller, Los Angeles	445

THE OTIS HERD

WILLOUGHBY, OHIO.
Milking Shorthorns

LADY OF THE GLEN.

Bred by us and acknowledged the best and most valuable individual of the breed. Largest herd in America with the best connection. Many cows weighing 1,700 lbs. and above with records of over 10,000 lbs. of milk. Winners at the recent Congress sale owned by us or of our breeding. Sale cattle in carload lots or single. Calf clubs a specialty.

Write T. H. Harrison.
Santa Rosa Stock Farm, Santa Rosa, Cal.
California Representative.

Milmar Stamp, Elinger-Johnson Co., Sacramento	825
Spicy Champion 2nd, Mrs. Susan Kohen, 270 10th Ave., San Francisco	635
Ormondale Radium, W. E. Dale, Menlo Park	450
Orden's Sultan, W. T. Chapple, Willits	900
Beaver Creek Bud, W. O. Blasingame, Fresno	350

The sale was cried by Col. Earl Gartin of Greensburg, Indiana, in a manner that was acceptable to both consignors and buyers. Col. Ord L. Leachman of Sacramento, by his brilliant work in the ring, was of much assistance to Col. Gartin.

CALIFORNIA SHORTHORN BREEDERS' ASSN. BANQUET.

The Shorthorn banquet held in connection with the Livestock Show at the California Building on Thursday evening of last week, was a very enjoyable affair.

Chas. N. Hawkins presided in his usual genial and informal manner and made everyone feel right at home. The herdsmen in charge of the prize winning Shorthorn herds were introduced by Mr. Hawkins as deserving the major credit for the success of the show.

B. O. Cowan was introduced as the man who knows more about Shorthorns than any one else and as the most beloved by Shorthorn men. Mr. Cowan emphasized the sentiment connected with the Shorthorn business.

L. A. Nares, President of the Cattle-men's Association, briefly sketched his experience in the cattle business, beginning with Mexican Long Horns and culminating with the importation of a carload of registered Shorthorn bulls from the East. Frank D. Tom-son, Manager of the American Shorthorn Breeders' Association and publisher of "The Shorthorn in America," said there was no fraternal order in which the members were closer and more harmonious than were the breeders of Shorthorns throughout the country. He ascribed the stability of the Shorthorn industry to the fact that it comprises numerous farmers with small herds. He estimated the number at thirty-five thousand and the average size of the herds at about 20 head. He suggested that breeders interest their neighbors in Shorthorns especially with respect to the purebred business.

THE WESTERN MEAT COMPANY AT THE CALIFORNIA INTERNATIONAL.

Through the winnings of the Western Meat Company of San Francisco in the carlot classes at the International Live Stock Show, the Red Cross and the Infant Shelter of San Francisco will be enriched \$370, according to the statement of F. L. Washburn, manager of the company, after the winnings were announced.

"It is not the policy of the Western Meat Company to be competing against stockmen," said Washburn, "and we will not show in stock shows of the future. In this show we simply entered to encourage the showing of carload lots and to insure this feature of the show being complete. The prize money we won will go to the Red Cross and the Infant Shelter."

The Western Meat Company won first and fourth in carlots of steers over three years old, including the champion carlot of the show. The Kern County Land Company of Bakersfield won second, and the New-hall Land and Farming Company of San Francisco third. C. Swanston & Sons of Sacramento won the first prize and reserve champion carlot of fat cattle in the class for two-year-old steers.

The Western Meat Company also won first prize with a carlot of fat sheep, carrying along the championship award in this class. The Foster Company was second and reserve champion, and the Union Land and Cattle Company third.

The winnings of the Western Meat Company in the hog carlots was first in the light hogs and third in the heavy packer hogs.

Model 265
Calco Sheep Feeding Rack

for sheep

These two Calco Stock specialties are especially for sheep. They are made of durable, rust-resisting "Armco" Iron, and will last a life time.

Sheep Feeding Rack

A real money saver. As sheep draw the hay through the rack, the fine chaff drops into the feed pan. Adjustable slides (not shown in the picture) can be so placed as to protect the sheep's eyes, or lowered for the feeding of alfalfa meal. The legs can be bolted down, if desired. Choice of two sizes, 5 or 10 feet long.

Sheep Watering Trough

This trough is built narrow and deep, but wide enough to permit drinking from both sides. Sheep cannot jump or be shoved into it. Can easily be kept clean, preventing disease. The edges are smooth and cannot injure the sheep. Built of "Armco" Iron—in four lengths from 7 ft. 9 in. to 19 ft. 8 in.

Send for complete description and price list.

The Retail Price of Milk

[Written for the Pacific Rural Press by Thos. F. McConnell.]

This is a subject attracting the attention of the consumer all over the country at the present time and by reflex action the attention of the producer as well. During the war the upward trend of prices was accepted with good grace by a very large majority of those concerned. Now that the war is practically over the consumer commences to be restive under the continued high prices, especially of the necessities. Then if there is a further advance this consuming public commences to want to know "the whys and wherefores" for such action.

The first thought with a majority of the consumers affected is that the producers, if they are organized, are simply boosting the price of their product with the idea of getting "all the traffic will bear," regardless of cost of production. There are always hot-heads among those affected adversely that will believe anything bad about the producer and commence to talk about boycotts and legal redress. There are also some people who always see a chance for eventual profit to themselves by "adding fuel" to this fire of discontent and rebellion. This is true, not of the consumer of one product, but all that may have increased in price at any time, particularly if it is a product of as much importance as milk.

We all look askance at any organization of business interests thinking that it cannot have motives that are entirely without selfishness. Therefore, when there is a raise in price on any article controlled or partially so by an organization, we immediately think of "profiteering" and know that we are victims of a conspiracy and commence to hold meetings, pass resolutions and perfect plans to reduce the H. C. L. so much talked about.

To get at the subject of "The Retail Price of Milk" in the right way, we ought to consider it in comparison with some of the other staple articles of food, as well as in other ways. Surely it is not any higher than eggs at the present time. In fact is very reasonable when compared with them. The price of sugar is controlled by the government, but at that the milk is not so much higher than the sugar. Beef steak, mutton chops and pork are all running a neck and neck race with milk and ahead at present. The loaf of bread has gotten smaller and smaller and the price higher until calorie for calorie the milk is fully as cheap as bread. Honey, one of the pair of "milk and honey," famous since the days of Moses, is double the price it has been in the past. Potatoes, one of the most common and standard foods, are twice what they were when milk was half what it is now. Olive and salad oils are not cheap by any manner of means.

It has been stated in public that babies were "dying in San Francisco," or soon will be because some of the charitable people cannot afford to buy it for them any more since it has gone up from 14 cents to 15 cents a quart. Times are hard, it is true, and there is a shortage of automobiles and moving picture theatres to accommodate the poor charitably minded people of the cities.

Differences in Cost.

How many of the people who are crying out against the great imposition of having to pay 15 cents a quart for grade A milk delivered to their doors in clean glass bottles, realize the difference in cost between this milk and that they received 10 years ago when babies were not dying for want of it. Dairies have to be clean, the buildings cost three times what

they did 10 years ago, labor is three times as high and the cows are worth three times what they were then.

How many stop to think what 100 good dairy cows are worth at the present time, or at least what they will bring? Fifteen thousand dollars at the very least. The interest on such an investment has to be taken into consideration. We also hear of the cow-to-the-acre dairy ranch, but generally there are at least two acres to the cow or 200 acres for a 100 cow dairy. What is that land worth today? We used to be able to buy it for \$100 an acre and that was a big price not so very many years ago when we were buying dirty milk for 5 cents a quart. Now, that land is bringing \$500 an acre, an investment of \$115,000 for cattle and land alone, and with interest at as low a rate as five per cent the price of milk cannot be low if the dairyman is going to come out at the end of the year with his bank balance in black ink.

Labor is High.

We have said but very little about the price of labor, but every one knows about that, but did those of you who are talking about and complaining and holding indignation meetings over 15 cent milk ever stop to think that the high price of labor, its present unreliability and its scarcity is driving and has driven scores of the best dairymen out of the business? That surely does not mean any lower price for this very necessary article of food, does it?

Cotton and Rice Are Profitable.

Another phase of the matter should be taken into consideration also. How many realize that some of the regions where alfalfa and dairy cows reigned supreme, and it was supposed nothing could break their autocratic control, have been changing their allegiance to another monarch? King Cotton steps in and brings the Salt River Valley of Arizona and the Imperial Valley of California under his rule to a great extent, for these same people who cannot afford to buy 15 cent milk for the "dying babies at San Francisco" must have especially good cotton for the fabric of their automobile tires. The price of the cotton is so high that 15 cent milk to the consumer is not enough of an inducement to keep out King Cotton.

There is another king in California that wants to reign instead of Queen Cow, and that is rice. Perhaps not as much alfalfa land has been plowed up for rice as there has for cotton, but rice takes lots of water and it takes it away from the alfalfa fields. Six cent rice beats fifteen cent milk.

The writer attended a meeting of dairymen in Fresno the past summer and more than one dairyman there said that 6 cent raisins (and that is not near what they received for them this year) was better than the price they were receiving then for their milk, and that was before it went to 15 cents.

Organization.

Nothing so far has been said about organization of the dairymen and it is so large a subject that space will not allow much to be said on that matter. There is an organization of milk producers in the State of California at the present time for the purpose so it is stated of placing the dairyman in a position to manufacture and market his own product at a reasonable profit and at the same time furnish the milk and its products to the consumer at a reasonable price. So far it looks as though figures on facts will show they are right.

It is hard for an organization of middlemen, who have heretofore placed their own margin of profit on the dairymen's milk, to be told by the organization of dairymen how much they may receive for selling the dairymen's product for them. It is rather irksome for them not to be able to buy at their own price and sell at their own. The "dear consumer" will find that the middleman wants to do just as he always has done. The dairymen of the State of California today are better friends of the "dying babies of San Francisco" than the middlemen ever have been, and it is safe to say ever will be.

5% 37% FAT

What does it mean?

SIMPLY this: It costs less to feed Jerseys than any other breed and they produce the richest quality of milk (butter fat average of 5.37%). Jersey Milk churned into butter and cheese bring the highest prices on the market.

Jerseys are the real "cow investment"! They start producing at an earlier age than any other breed and are still great milkers long after other cows have gone dry.

Let us give you some surprising information about Jerseys in our free booklet "Profitable Facts About Jerseys". Write today for it.

GERMOZONE The Best Pet Stock Remedy

For Poultry, Pigeons, Dogs, Cats, Rabbits, Parrots, Canary and other birds or pet animals. Germozone is a universal and safe remedy for colds, snuffles, roup, sore throat, loss of voice or singing, influenza, bowel trouble, distemper, sore eyes or ears, canker, gleet, loss of fur or feathers, sores, wounds, skin disease, or other affections of skin or mucous membrane.

"My hens have never done so well as this year and haven't lost a single chick."—Mrs. Flora Koppie, Walker, Ia. "Simply grand for rabbits."—L. W. Browning, Boone, Ia. "Cannot praise Germozone enough. I use it for chickens, stock and household."—Mrs. Wm. Hoeppel, Hugo, Okla. "My bird puppies don't know what distemper is and I never had such good success before with chicks."—Curley Smith, Kennett, Mo.

Germozone is sold by most drug, seed and poultry supply dealers, or mailed postpaid in 25c, 75c, and \$1.50 packages from Omaha. Book on treatment of diseases free with each package.
GEO. H. LEE CO., Dept. 428, OMAHA, NEB.

Livestock and Dairy Notes

Dairy Notes.

R. S. Holmes of Modesto, recently sold to Mr. Logan of Stockton, a very fine Holstein-Friesian bull.

E. B. McFarland of San Mateo and owner of Steybrae Farm, reports the sale of three of his finest Ayrshires.

R. F. Guerin of Tulare, made a recent sale of two crackerjack Holstein bulls to dairymen of the Paige district of the San Joaquin valley.

L. Dee Smith of Oakland, reports another remarkable record of the senior 2-year-old Guernsey heifer, Mysie's May of Claremont 71778, in class F F. She gave 779.70 pounds butterfat during past year, dropped a fine heifer calf during the California International, as well as taking first prize in her class and first as A. R. O. Guernsey cow.

Winifred Hotaling 3rd, one of that great family of producers, has just finished a fine 30-day record at the Holstein-Friesian farm of W. J. Higdon, Tulare. She gave 110.43 pounds butter and 2598.9 pounds milk. Mr. Higdon has sold a splendid junior yearling, seven-eighths white, Holstein-Friesian show bull to Joaquin Luess of Tulare, for \$500.

Swine.

J. F. Lehman of Lodi, the "strictly big type" man, sold a young boar to Henry Rued, Jr. of Healdsburg. Mr. Rued believes in getting the very best he can buy, regardless of cost.

H. P. Slocum & Son of Willows, have sold lately one Duroc-Jersey boar and 12 sows to John E. Bogue, a new breeder of Newcastle; also one boar to

O. S. Steele of Princeton; one boar to Jasper Jones of Lemoore and 8 head of especially good ones to go to Oregon.

R. G. Hamblin of Kingsburg, a recent member of the Kings County Poland-China Breeders' Association, reports excellent results from the sale of his consignment of open gilts to the semi-annual sale at Hanford, October 11. Mr. Hamblin expects to build up a good-sized herd of large type Poland-Chinas.

Castleview Ranch, breeders of Berkshire swine, report the sale of three service boars, one each to the following parties: Balfour, Guthrie & Co., Brentwood; College of Hawaii, Honolulu; F. E. Crowell, Alpaugh. Mr. O'Connor, proprietor of the above ranch, has just finished a very successful circuit of the fall fairs with his show herd and says that next season he expects to have a larger and stronger herd in the ring than ever before.

At the Farm Marketing Bureau auction sales held in Fresno last week, \$17.80 was the top price paid for hogs. This was the highest price for fat hogs at any sale held in the United States during that week. Six cars in all were sold, the second car bringing \$17.25. The lowest price was \$12.30 for rough, staggly stock. On the day of the auction the top price exceeded the top price in Chicago almost \$3. The high price was due to the excellent quality of the consignments and the demand for such stock.

Tom Bodger, Hampshire swine breeder of Gardena, writes that he has six sows that farrowed 50 pigs. Two of the sows were responsible for 11 pigs each with nearly all perfect white 'belts.' Forty out of the total 50 had perfect "belts" and 7 with three-quarter "belts." He thinks that is "going some." He has recently sold one weanling boar pig to go to Plymouth, Amador county, and one weanling sow pig to Manzanar, Inyo county. Mr. Bodger has a very well-bred lot of sows in his herd carrying the blood of Draper Lad, Director, Gold Mine, Lookout, Cherokee and Captain Kenton.

Beef.

C. N. Langton of Visalia, owner of the Diamond L Ranch and breeder of Aberdeen-Angus cattle, says that the one display "ad" in the Pacific Rural Press sold him out completely. A recent sale of one bull to W. J. Fulham of Visalia, was reported by Mr. Langton on his visit to the California International.

Merritt-Bowers Co. of Tulare, report the sale of one carload of Hereford bulls for range use. Also one carload of Shorthorn females for the same purpose. Extensive preparations are being made for the great sale on December 16 at their Tagus Ranch. Nearly all the prize winners they have shown from Salem, Oregon, to Los Angeles, will be offered.

Thos. Harrison, Milking Shorthorn breeder of Santa Rosa, has made recent sales as follows: One yearling bull to Mr. Truitt of Healdsburg; one yearling bull to J. S. Stump of Bloomfield, the second prize aged bull at Sacramento and a 3-year-old cow to A. J. Tarish of Taylorsville. A man that breeds good stock and lets people know he has it can always sell it for a good price.

Livestock Shippers to Organize.

There will be a meeting to perfect the permanent organization of Co-operative Livestock Shippers December 3-4, on the 3rd floor of the Livestock Record Bldg. Union Stock Yards, Chicago, Ill., during the Chicago International Livestock Exposition. Those interested should attend.

GUERNSEYS

Represent the best blood lines of the breed. They combine big production and show type.

L. DEE SMITH, Proprietor

VICENTE ROAD,

BERKELEY, CALIFORNIA

Ormondale Company Sells a Good One.

A heifer sired by Golden Goods, Jr., and out of Gem's Beauty ought to be good and she is. A wonderfully deep, smooth, very thick fleshed animal, she is good enough to go anywhere. Many judges think she will in another year be even harder to beat than now or in other words she is a female of great promise. One of the kind that keeps on getting better as they grow older. Anyw y she is good enough for C. N. Hawkins of the Pacheco Cattle Co., Hollister, to pay the Ormondale Company of Redwood City \$2000.00 or better for her. While that would be a high price to pay for some heifers it is not for this one. She is of the kind that would do good in any herd as a breeder and if a show cow is wanted she will be there "in the money." Many will go further, pay more and buy less. The Ormondale Company seem to be able to furnish winners. They bred Little Sweetheart that has been grand champion Shorthorn female wherever shown this fall and that is pretty nearly everywhere.

Bernstein to Hold Another Sale.

Another sale scheduled by Wm. Bernstein, the prominent Poland-China breeder of Hanford. Everyone knows the Wm. Bernstein auction sales as offering the best of the breed found on the Pacific Coast. Hanford and Kings county have a reputation for top notch Polands and Wm. Bernstein has been one of the leaders in the business. The sale will be on the 29th of November, the Saturday following Thanksgiving. This is one sale you should not miss.

Fresno County Poland-China Breeders' Association Sale.

Look up the "ad" in this week's issue and just notice the blood lines of the swine offered. All the popular strains are in the offerings and being in this sale is conclusive evidence as to the quality of the individuals. If you are in need of Poland-Chinas for breeding purposes, do not miss this sale. Everything from service boars to bred sows.

Good Steers Bring Good Money.

The Ormondale Company had a good Shorthorn steer, so good in fact, that he was awarded first prize in the Yearling class of that breed at the California International. Thos. T. Miller of Hollister had third prize in the same class. After the show was over and the steers had won all they could the buyers of good beef commenced to size up the different animals and finally these two yearling steers were purchaser by the Palace Hotel for twenty cents per pound.

Union Stock Yards for California

(Written for Pacific Rural Press by G. Walter Reed.)

With the new trade zone opened up with South America and the Orient, in addition to supplying the Hawaiian, Philippine and other countries of the globe with California-grown products, the Golden State holds the key to the Pacific and is destined to play the important role in the after-war race for commercial supremacy of the world.

The State Board of Control recently gave out statistics showing that California affords and her people enjoy cheaper living conditions than prevail in any other State, all because California is a great empire within her own boundaries and depends upon no other source for her food supplies and little else excepting raw material for certain manufacturing industries.

To make the State still more powerful and dependable, both in its home production and export trade, there will soon be added packing-house products which will bear the California trade mark of excellence and superior quality that has carried the fame of the State throughout every country on the globe where her fruits, vegetables, canned goods, dried peaches, apricots, prunes, etc., have been eaten.

Experts who have studied the physical conditions claim there is the greatest opportunity for not only supplying all local demands for meats, fresh and cured hams, bacon and tinned goods, but filling immense contracts for the American War and Navy Departments and those of other Nations for the distribution in the Pacific and Far East.

Instead of shipping California-raised steers, fat hogs and mutton to packing houses hundreds and even thousands of miles East to be slaughtered, packed and returned with high

freight charges assessed both ways, the waste in time and losses to the producer, due to the lack of a dependable home market will be eliminated, with the additional advantage of having created and materially increased the demand.

During the recent war contractors for the United States Government found it necessary to go into Texas and Mexico for the purpose of gathering up cattle to fill orders. These cattle had to be shipped on the hoof to Eastern packers and when the products was ready to again be shipped—this time to the Pacific Coast—an added expense of transportation across the continent was put on, which naturally was paid by the producer.

It stands to reason that if California can lead the world in the production of vegetables and fruits, and is able to supply her own millions with a cheaper and better food article, while the producer gets a fair profit and return upon the investment, the same can be done in the matter of meats and the by-products of hog, beef, and mutton.

The agencies that will bring California and adjoining states into a full realization of the great opportunities in cattle, hog and sheep raising by providing ample markets for such products, are packing houses and union stock yards.

A packing company capitalized for \$5,000,000 to establish a packing house and union stock yards at Sacramento is headed by Chas. E. Virden, president of the Sacramento Chamber of Commerce and head of a number of producers' organizations that have done much to advance agriculture in this State.

MILLER-MAGRUDER-DEWOLFE COMBINATION SALE.

A successful Holstein-Friesian auction sale was held by C. A. Miller, Gotshall & Magruder, and H. A. De Wolfe at the ranch of Mr. Miller, northwest of Ripon. It was practically a dispersal sale so far as the Miller herd was concerned. Good prices were obtained, and it was a satisfactory sale from all view points. While there were no particularly high prices, the average was excellent.

The grand total for the three consignments was \$20,640, which was quite a sum of money to change hands on 89 head of cattle, including calves and matrons and bulls. The years are not so far past in any part of the world where this would have been considered a phenomenal sale. An average of \$230 or better, when 40 years ago \$30 would have been thought good for the same number of cows in full flow of milk. This, therefore, is one of the successful Holstein sales of the year, everything considered.

Miller Makes Money.

The Miller offering, consisting of 42 head, large and small, of which 26 cows and heifers brought the average price of \$303.85. Six heifer calves sold for \$1,085, an average of \$180.83. Ten bulls, mostly less than one year

old, average \$89 each. The whole consignment brought \$8,970. The top of this consignment was the 9-year-old cow, Sarcastic Dora of Millbrae, which sold to Edwards Bros. of Escalon for \$600. When we consider that no testing for butter and milk production had been done, the prices obtained were very satisfactory.

The Magruder Offering.

The Gotshall and Magruder consignment of 28 head brought good prices, especially the heifer calves. Eight of these sold for \$1,315, or an average of \$164.38. The heifers and cows brought \$4,570, making an average of \$304.66 for the 15 head consigned. The bulls brought \$445, an average of \$89 for the five head.

De Wolfe Does Well.

H. A. De Wolfe of Ripon sent 16 head of excellent Holstein cows and 3 bulls, all of which brought good prices. They were an even lot. The prices ranged from \$200 to \$500 for the 16 cows, bringing a total of \$4,950 of \$309.38. The three bulls averaged \$130 each, and it was not a bully day either.

Why shouldn't rice growers spread their straw back on the land where it is not too much infested with water-grass?

CALEDONIA SHORTHORNS

LARGEST AND BEST IN THE WEST

Herd consists of 400 wonderful breeding matrons, combining the best blood of the noted Harkness and Elindorff herds. Herd Sires:

IMP. CALEDONIA, considered the best Scotch bull imported in recent years.

**AGRICULTURAL PROGRESS IN
NEVADA.**

Storage of water in the Lahonton dam near Fallon began October 21. It is expected that an ample supply of water will be stored before early spring.

For miles in every direction the country surrounding Fallon is dotted with stacks of alfalfa hay estimated to contain over 20,000 tons. So far only about 15,000 tons have been sold at prices ranging from \$15 to \$16 per ton. This valley is unusually well equipped for cattle and sheep feeding. The soil is sandy and does not work into mud so easily as the heavier types of soil.

Following the testing for tuberculosis and condemning of approximately fifty per cent of the milking herds in the upper Carson Valley near Gardnerville and Minden, the Douglas County Creamery has made arrangements to ship in several carloads of tested milk cows from California and Oregon to take the place of the reacting cows ordered slaughtered.

At a recent sale in Washoe Valley to a Carson Valley farmer of a herd of thirty cows the price was \$110 per head for the entire herd.

The bee industry in the Newlands Project near Fallon has grown to be quite a profitable business. Bee keepers have had a very successful year in producing a fine quality of honey. The honey has been shipped out in five gallon cans, selling at 28c. E. G. Norton has the largest apiary in the project. He has been caring for about 700 colonies during the past season. A live organization of some fifteen members has been organized to promote the bee industry in this section.

Continued interest in irrigation projects is being experienced in Nevada, especially in the extreme southern country. State Engineer Scrugham is to meet the farmers of the Mesquit and nearby sections along the Virgin River to organize an irrigation district. The proposed project is to divert a portion of the flow of water from the Colorado River. Arrangements are under way with the Arizona authorities, and no difficulties are looked for from this source, to divert the water from the Arizona side of the river. It is impossible to take water from the Nevada side for a big drift of sand is experienced at this point, occasioned by a large bend which causes huge sand bars to form at the point where the canal should be constructed if the Nevada banks of the river were to be utilized. Chief Engineer Cottrell of the State Highway Department is altering his plan for the construction of a concrete bridge to allow for a suspension flume across the river from the Arizona side, which will deliver water to the project. Without the use of the state bridge the cost of construction would be excessive for this project. The lands are at present unwatered, and there is enough acreage to form an irrigation district. Land in this section is extremely productive. With nearby markets in Southern California and the Nevada mining towns this project will soon be a desirable location for new settlers.

The Office of Cattle Protection caused the arrest of B. Zeff, a slaughterer, at Modesto, for operating a slaughter-house in that city without having first obtained a license to so operate as provided in the "Hide and Brand Law." Zeff was accused of slaughtering cattle that had not been inspected for marks and brands by an Inspector appointed by the Department of Agriculture. James B. Newsum, Secretary for the Office of Cattle Protection, assisted in securing evidence which resulted in the conviction of Zeff, who was ordered to pay a fine and which fine was paid.

BLOOD WILL TELL**AT THE PANAMA-PACIFIC EXPOSITION**

Just 4 years ago in the greatest Berkshire Show ever held in the West, our senior herd sire,

STAR LEADER

was made Reserve Grand Champion to his great sire, Grand Leader 2nd, the Grand Champion of the Show.

AT THE CALIFORNIA INTERNATIONAL SHOW

last week a carload of fat barrows shown by Napa Hospital and sired by a son of Star Leader, was awarded the Grand Championship over all breeds.

AT THE 1917 NATIONAL SWINE SHOW

The Grand Championship was awarded to Baron Duke 201st. This year his son, our Junior herd sire,

NATOMAS BARON DUKE

won Grand Championship wherever shown at the California State Fair and at the California International Livestock Show.

WE WILL SELL

A few daughters of Star Leader, mated to Natoma's Baron Duke for early spring farrow, also a few granddaughters of Star Leader.

DAIRY PRODUCTS EXHIBIT AT SAN FRANCISCO LIVE STOCK SHOW.

The dairy industries exhibit at the California International Live Stock Show was under the supervision of the Dairy Industry Department of the University of California. Seventeen varieties of cheese made in California were shown, including practically every grade and table cheeses. Cross sections of each cheese were on exhibition to illustrate type and quality. The judges of cheese and butter classes were Mr. T. J. Harris of the San Francisco Dairy Exchange, and Prof. H. S. Baird of Davis. Prof. C. L. Roadhouse of Davis judged the commercial milk and cream classes.

It is interesting to note the wide distribution of the exhibitors. Butter and cheese from all parts of the state was shown and all of very high quality. The winning exhibit of Pete Peterson, Valley Flower Co-operative Creamery, Ferndale, was noticeable for uniformity of color, quality and texture throughout.

The butter and cheese awards were as follows:

BUTTER AND CHEESE AWARDS.

(List prepared by J. C. Marquardt.)

Creamery Butter—1st, Pete Peterson, Valley Flower Co-operative Creamery, Ferndale.
Other scores over 90—Western Meat Co., San Francisco, 93; Hooper Creamery, 1801 Polk, San Francisco, 93; J. R. Welke, Sierra Valley Creamery, Layton, 93; San Joaquin, Valley Milk Producing Association, Madera, 92½; A. Wirz, Hollister Creamery, Hollister, 92½; C. A. Holm, Moss Rose Creamery, San Francisco, 92; H. Bino, Petaluma Creamery, Petaluma, 92; Castroville Creamery, Castroville, 92; H. Dors, University Farm, Davis, 92; Carl Hansen, Hanford, 91½; Harry Wolf, Crystal Creamery, Sacramento, 91; Danish Creamery, Fresno, 90½.

Display of Creamery Butter—1st, Makins & Company, San Francisco. Judged by Mr. H. S. Baird, University of California, Davis. T. J. Harris, Official Scorer on S. F. Exchange.

Cheddar Cheese—1st, University Farm, Davis, 94. Other scores over 90—Northern California Milk Producers' Assn., Sacramento, 93.

California Cheese—1st, University of California, Davis, 93. Other scores over 90: Mayrose, Western Meat Co., San Francisco, 92.

Jack Cheese—1st, Associated Dairymen, Soladad, 93½. Other scores over 90: G. V. Quinto, Patterson, 92.

Swiss Cheese—1st, Calif. Central Creamery Co., San Francisco, 95½.

The milk and cream awards were as follows:

Class 688, best bottled certified milk—1st, Hollow Hill Farm of Colton; 2nd, University of California at Berkeley.

Class 689, best bottle certified cream—1st, Hollow Hill Farm of Colton.

Class 694, best bottled pasteurized milk—1st, Columbia Dairy, 231 Franklin, San Francisco; 2nd, San Mateo Dairy, 1818 Howard St., San Francisco; 3rd, Dairy Delivery Co., 3550 19th St. San Francisco.

SHORTHORN BREEDERS' BANQUET.

(Written for Pacific Rural Press.)

The Shorthorn banquet held in connection with the California International Live Stock Show in the California Building on Thursday night of last week, was a very enjoyable affair. Chas. N. Hawkins acted as toastmaster in his usual genial and informal way and made everyone feel right at home. He introduced the group of herdsmen present and declared they deserved a large part of the credit for the success of the show.

B. O. Cowan, introduced as the man who knows more about Shorthorns than anyone else and the most loved by Shorthorn men, spoke on the sentiment in the Shorthorn business. L. A. Nares, president of the California Cattleman's Association, briefly sketched his cattle experience, beginning with Mexican "Longhorns" and culminating with the importation of a carload of registered Shorthorn bulls.

Frank D. Tomson, representative of the American Shorthorn Breeders' Association and editor of the Shorthorn in America, gave a very interesting and inspiring talk. He declared that there is not a fraternal order in which the members are in closer harmony than are the breeders of Shorthorns throughout the country. He ascribed the stability of the Shorthorn industry to the fact that it comprises a very large number of farmers with

comparatively small herds. He estimated the number at over 30,000 with an average of about 20 head each. He advised that Shorthorn breeders strive to interest their neighbors in Shorthorns.

Cane molasses as a feed for hogs and cattle is coming to the front quite rapidly. It contains a very high percentage of sugar, running all the way from 45 to 50 per cent sugar.

1—Natural Rock Salt

Now generally discarded by stock feeders who have tried Carey-ized Block Salt, because of its impurities, shale and rough edges which frequently lacerate animals' tongues and cause other troubles.

2—Carey-ized Block Salt

composed entirely of Pure Dairy Salt, pressed into solid 50 lb. blocks, overcomes all the troubles of natural rock salt. Placed under a shed in pasture or range it salts animals regularly without waste.

3—Carey-ized Block Salt Sulphurized

combines Pure Dairy Salt with just the right proportion of sulphur to meet the needs of animal systems. Promotes growth of young stock and health of mature stock.

4—Carey-ized Stock Tonic

is composed only of the following: Iron Sulphate, Powdered Gentian Root, Bicarbonate of Soda, Sulphur, Quassia, Carbonized Peat, Charcoal, and Pure Dairy Salt. It prevents worms and scours, keeps digestion in good order and saves feed, vitalizes the blood, promotes healthy activity of kidneys, liver and bowels. Does away with dosing and drenching. Salts animals regularly and economically.

The How and Why of Carey-ized STOCK TONIC BLOCK AND BRICK

Like all really great things in scientific discovery and manufacture, Carey-ized Stock Tonic is the result of gradual development. Years ago we sold the Natural Rock Salt for stock feeding, in connection with our other salts, because there was nothing better to be had at that time. But we found that it often contained impurities which disagreed with animals; stock feeders also complained that their animals suffered from sore tongues, caused by licking the sharp edges and shale in the natural rock salt.

So we conceived the idea of pressing Pure Dairy Salt into solid block form; had special machinery built which exerts a pressure of 3000 pounds to the square inch, and produced the now famous Carey-ized Block Salt. It represents the most convenient, surest and economical way of salting live stock.

The great demand for a Sulphurized Salt among stock feeders next engaged our attention. Sulphur is one of the most urgent needs of all animals, is the very best blood purifier known to medical science. It is direct in its action on the liver and spleen; also a vital element of the muscles, hair and skin. Carey-ized Block Salt, sulphurized, meets this demand at a minimum cost in money and trouble. Finally, after consultation with practical live stock men and with the aid of the United States Bureau of Animal Husbandry, we prepared and adopted the formula for Carey-ized Stock Tonic Block and Brick—

The Guaranteed Worm Destroyer and General Live Stock Conditioner

This product represents the most approved method of promoting animal health. It does away with powders, liquids, dosing and drenching—permits animals to condition themselves according to their own instincts, without bother to the caretaker, and at minimum expense. It supplies, in correct proportions, all the vegetable and mineral salts which animal nature demands, and in which ordinary feeds are deficient, besides being an unfailing worm destroyer.

Carey-ized Stock Tonic was put on the market only after it had been thoroughly tested by practical stock feeders and proven to produce the results we claim for it in every particular. We guarantee it, because we know that it is right and can be depended upon for satisfactory results when fed according to directions.

Sold on 60-Days' Trial Under a Positive Satisfaction Guarantee

Carey-ized Stock Tonic 3-lb. Bricks or 50-lb. Blocks are sold by Grocers, General Stores, Druggists, Feed and Hardware Stores. If your dealer cannot supply you send us his name (no money) and we will send him for you 12 bricks (35-lbs.) at \$2.90 f. o. b. Hutchinson, or 50-lb. block \$3.25, or if you prefer send us the amount and we will send goods direct to you freight collect. If at the end of 60 days' trial according to directions you are not entirely satisfied we will refund all your money, including carrying charges. Your banker will tell you we are responsible. Fill out and mail us the coupon for free book "Making Live Stock Pay."

Poultry and Rabbits for Profit

POULTRY SHOW AT INTERNATIONAL PASSES INTO HISTORY.

(Written for Pacific Rural Press.)

So far as the poultry and rabbit exhibits were concerned, the first annual exhibition of the California International Livestock Show, held at the California Building, San Francisco, was a great success. While there have been larger displays of poultry at previous exhibitions, the quality of the birds shown has rarely been ex-

Dr. Frederick D'Evelyn, His hobby is rabbits, but he likes poultry.

celled, and as for the rabbit section, it scored a record in point of number of entries, and from the fanciers' standpoint it suffered nothing in comparison with shows that have preceded it on this side of the continent. The attendance was good considering the handicap of situation. The California Building, while ideal from the standpoint of accommodation of the stock housed, is too remote from the city's center for the convenience of a patronizing public, and the attendance was

perhaps not more than one-third of what it would have been if located on some commodious lot on upper Market street. However, all things considered, there can be no justifiable complaint of lack of public appreciation. The old ballroom of the building, in which the poultry, pigeon and rabbit entries were installed, was kept alive with interested visitors throughout the week, and on the final Saturday and Sunday the alleys were fairly jammed with people, both those who knew stock and those who didn't but would like to—and the latter as usual were in the large majority. The classy birds and rabbits of all varieties were a delight and inspiration to admiring throngs of adults, and the crow and cackle of the fowl, the freaky-feathered pigeons, and the capering of the frolicsome bunnies were a source of unrestrained delight to the juvenile element.

From the standpoint of the exhibitors no disappointment was registered. On the contrary, quite a little real business was done. A large number of orders for stock and eggs were taken through the week, and in nearly all instances good and in some cases fancy prices were obtained. One satisfied buyer from abroad paid \$150 for a pen of 12 hens and one rooster—Barred Rocks.

Chas. H. Voddén of Los Gatos had a large entry of superb birds of the Barred Rock variety, and almost swept the deck in prize-taking. His success was beyond his anticipations—and he had reason to expect something from his 22 years of breeding in this line. We present in this issue a picture of Mr. Voddén's prize cockerel. The Poppy Hill Poultry Farm, Oakland, also made some nice winnings on showings of this popular American breed.

In the Rhode Island Red class, which scored the largest number of entries of any one variety, and in which much interest was shown, M. E. Jeter of San Francisco, and Oak Shadows Farm of Redwood walked away with the bulk of the prizes. Oak Shadows also won the special award for the best hen in the show with a Buff Orpington, also the sweepstakes prize for the pen of best egg-layers. These were Buff Orpingtons also. Samuel Abrams of Los Altos won second on pullet—a bird of fine type and beautiful plumage.

Among the Wyandotte entries, of which some splendid specimens were shown in all colorings, our old friend, Wm. A. French of Stockton, won first on hen and first on pullet in the Silver Laced class. Incidentally it may be mentioned that Mr. French also showed an outstanding winner in the Rouen Duck class with first old drake. He also won second on old ducks.

Los Angeles, which is reputed to have contracted the crowning habit in an exaggerated form, furnished the prize rooster of the exhibit in the shape of a Dark Cornish cock entered by Percival E. Edouart, who took second on hen in the same class.

The Rabbits.

The large rabbit display came in for much favorable comment. The Flemish Giants led the procession in point of numbers and interest, Erwin Wiesner, the superintendent of this department, falling in for full honors in this class in the distribution of cups and ribbons. An interesting feature of the

Livestock Show week was a banquet tendered to the directors last Sunday afternoon by Erwin Wiesner.

Some of the silver cups offered for outstanding exhibits in the rabbit display were distributed as follows: The Sperry Flour Company's cup, offered for the best and largest display of all varieties, went to Ernest Wiesner; as did also the handsome cup offered by the Oakland Tribune. The Dr. D'Evelyn silver cup, offered for the

First Prize Cockerel
International Live Stock Show 1919
San Francisco, Calif.
Bred and Owned by Chas. H. Voddén,
Los Gatos, Calif.

best and largest display of all varieties entered from San Francisco County, went to the Exposition Rabbitry, and the J. E. Stewart cup, offered for the second best and largest display of all varieties, passed to the possession of W. Hickling.

Messrs. D'Evelyn, Moore, and Wiesner have every reason for self-congratulation on the excellence of the showing made in their respective departments.

OAKLAND POULTRY SHOW NEXT.

During Thanksgiving week—namely, from November 25-30—the Oakland Show of poultry, pigeons, rabbits, and pet stock will be held at the Oakland Auditorium, under the auspices of the Alameda County Poultry Association. Besides ribbons and trophies, some attractive cash prizes for best exhibits have been provided. A general invitation to poultry and rabbit men is extended.

RABBIT CONGRESS AT INTERNATIONAL.

The meeting of the Rabbit Congress which convened at the Livestock Show was well attended, both by breeders and fanciers. Frederick W. D'Evelyn of the Pacific Rabbit Breeders' Association presided. He said the Congress at Washington, D. C., and the Rabbit Congress at San Francisco, were both making history and endeavoring to solve problems of significance to the rabbit industry. The program, while elucidating important facts more directly associated with the "Fancy," also emphasized very strongly the "back yard" rabbit as a valuable asset in the solution of the H. C. L.

Farm Adviser Lee of the U. S. Agricultural Department, presented in a graphic and attractive manner "Rabbits and All About Them." He said: "The breeding and raising of rabbits was no longer a mere hobby or fad; but a matter of sufficient importance to enlist the attention and co-operation of the Government, through its Specialized Agricultural Department." Mr. Lee recommended a more careful selection of stock, as the latter was the real basis for successful rabbit culture.

Judge Louis Regner stated that the present rabbit display had never been equalled either in quality or in numbers by any exhibition west of Chicago. Mr. John J. Oliver of Richmond, rather startled the audience by saying, "We are now prepared to produce rabbit meat—and there is none better—at ten cents per pound. Under such conditions there is no use passing sleepless nights and anxious days as to the purchase of eggs at 95 cents per dozen, or porterhouse steaks

FOR SALE—Very fine young White Holland turkey toms. Wanted—a few Guinea fowls. Mrs. R. S. Mossman, Antioch, Cal.

CHICKENS, DUCKS, GEESSE, GUINEAS, Pea Fowl, Pigeons. Wm. A. French, 545 W. Park St., Stockton, California, Stamps.

BUFF ORPINGTONS, BUFF DUCKS, BOURBON RED TURKEYS—The Ferris Ranch, Rt. 2, Box 144D, Pomona, California.

GOLDCROFT BUFF ORPINGTONS—Winners San Jose show. Choice stock for sale. Samuel Abrams, Los Altos, Calif.

MAMMOTH BRONZE TURKEYS, Embden Geese and Collie Dogs for herding purposes. John G. Mee, St. Helena, Cal.

BOURBON RED TURKEYS—Mrs. Geo. F. Smith, Hardwick, Cal.

Chickens never wash, as many other birds do, but cleanse themselves of insects by wallowing in soil. For this reason every poultry house should be provided with a dust box.

at front foot-prices. The desirability of establishing a 'rabbit department' under the guidance of the University of California, a scheme interrupted by the war, was again given consideration and suggestions for its promotion presented." The Congress closed with an injunction to boost for the Oakland Show. No empty rabbit hutches—"over there"!

LACK OF GREEN FEED.

To the Editor: I have about 30 old hens and 20 young Barred Rock Pullets. I feed about one and a half gallons of Sperry Surelay hot in mornings and about a gallon wheat and barley or oats mixed at night, or kaffir corn. The hens have range on alfalfa and the orchard and buildings. Some are molting now and some are through, while some are just starting. I get one egg every other day. Would you please advise me why I haven't been getting eggs since August.—Mrs. G. R. E., Gridley.

The amounts of mash and grain are ample to provide for the maintenance of the fowls and material for satisfactory egg production. Molting is in a great measure responsible for the lack of eggs, but if all other conditions were perfect that alone should not bring the egg yield down to one per cent during September and October. It may be the fowls have tired of alfalfa and eat very little of it. A variety of greens and vegetables is necessary, particularly when old hens are to be encouraged to lay and molt at the same time. A number of other conditions may be responsible but, in our opinion, the lack of tempting greens is the chief reason for the few eggs received from the flock.

RABBIT SLOBBERS.

To the Editor: What will I do for rabbits when they have the slobbers, and diarrhoea, also for chickens with scales on legs and flees on head?—S. H. S. Torrance, Los Angeles Co.

Slobbers in rabbits is a symptom of acute indigestion. Rub salt in the mouth and on the paws of the animal affected, withhold food for about a day, and thereafter boil the food until the indisposition passes off. Slobbers is not a serious complaint unless neglected.

Diarrhoea in chickens is due to an inflammation of the mucous membrane of the digestion tract. Change the ration and keep plenty of charcoal accessible to the chickens. Keep the drinking vessels well washed and the premises sanitary. (2) For scaly legs wash the legs with strong soapsuds and then rub with carbolated vaseline. Continue the treatment until the legs are clean.

QUESTION OF DUCK MATING.

To the Editor: I have two brown ducks hatched from a fawn Indian Runner duck mated to a Mallard Drake. What breed of drake would you advise getting to mate to these ducks to be the most profitable?—Subscriber.

If the production of eggs is more profitable than meat we recommend using an Indian Runner Drake, but if table qualities in the young are more desired a Mallard drake would be preferable.

Growing chicks that are kept closely confined need much greater attention along all lines than those that have range. See that they have plenty of green feeds that have not wilted down to almost the decaying point, and that the yards are kept sweet. Culling also is more essential when chicks are closely confined.

Cut Hauling Costs Between Farm and Market

Minimize your hauling costs. Make your truck or passenger car do double duty—earn double profits by trailerizing. Two and four-wheel trailers are necessities on every well-equipped ranch.

THE MARKET REPORTS

SAN FRANCISCO.

San Francisco, Nov. 12, 1919.

BARLEY.

Barley is showing some strength on account of the decrease in this year's crop. There is little of the shipping variety on the market and that description is quiet, but feed barley is showing activity on the exchange and futures are selling at a higher price.

Feed \$3.20 @ 3.25
Shipping \$3.25 @ 3.30

OATS.

This grain is stronger in sympathy with barley. A better demand for all grains is now looked for by some dealers.

Red feed, per cbl. \$2.85 @ 3.00
Red for seed Nominal
Black for seed Nominal
Recleaned Red or Black for seed. Nominal

CORN.

Corn has not yet responded to the strength of the other grains, and is not strong at prices quoted.

California \$3.60 @ 3.70
Egyptian, choice \$3.30 @ 3.40

HAY.

Receipts of hay during the past week were 1349 tons, compared with 885 the previous week. It practically all arrived by water and was taken to the warehouses. The car situation is still deplorable. Stocks in the city are therefore depleted and the hay received is held at firm figures. Demand in San Francisco is somewhat lighter, even under the above conditions, but there has been a large movement in the country.

No. 1 Wheat, or Wheat & Oat \$18.00 @ 22.00
No. 2 Wheat, or Wheat & Oat \$17.00 @ 19.00
Choice Tame Oat Hay \$20.00 @ 23.00
Wild Oat Hay \$18.00 @ 19.00
Barley Hay \$16.00 @ 20.00
No. 1 Alfalfa Hay \$18.00 @ 23.00
Stock Hay \$13.00 @ 16.00
No. 1 Barley Straw, per bale. \$5 @ .80

FEEDSTUFFS.

Lack of rain is holding back the ranges, and feedstuffs are showing strength. Attention is called to the fact that quotations are f. o. b. warehouse San Francisco, and buyers must pay cartage as well as freight when shipped from the city.

Roller Oats \$83.00 @ 84.00
Rolled Barley \$65.00 @ 66.00
Cracked Corn \$80.00 @ 81.00
Alfalfa Products \$38.00 @ 45.00

POTATOES, ONIONS, ETC.

Potatoes are showing considerable strength, though there has been no advance in prices. Salinas potatoes are now arriving and find ready sale at from \$3 to \$3.25. Oregon Burbanks sell at \$2.85 to \$3, and Idaho Gems

\$2.85 to \$3.25. Yellow onions are not in demand and sold at lower figures this week. The browns are steady at unchanged quotations. The general vegetable market is somewhat quiet with higher prices for peas and beans and lower for tomatoes.

String Beans 12 @ 15c
Peas 15 @ 17c
Carrots, per sack \$1.00 @ 1.25
Cucumbers 75c @ 1.00
do, Hothouse \$2.00 @ 2.25
Eggplant, box \$1.25 @ 1.75
Lettuce, per crate 75c @ 1.25
Tomatoes, Stone \$1.00 @ 1.25
Hubbard Squash \$1.25 @ 1.50
Pumpkins 75c @ 1.00
Potatoes, local whites \$2.50 @ 2.75
do, Rivers \$2.50 @ 2.85
do, Sweet, Dew, lb. 3½ @ 4c
Onions, Brown \$4.00 @ 4.25
do, Yellow \$3.25 @ 3.75
do, Green, Alameda \$1.00 @ 1.25
Garlic 20 @ 22c

BEANS.

The bean market showed little activity this week. Bayos advanced 25 cents. There are none but Garbanzos on the market at present.

Variety Old crop New crop
Bayos \$6.50 @ 6.75 7.25 @ 7.50
Blackeyes \$5.75 @ 6.00 6.00 @ 6.15
Cranberry \$6.00 @ 6.25 7.25 @ 7.75
Pinks \$5.50 @ 5.75 5.75 @ 5.90
Red Mexican \$5.00 @ 5.75 5.50 @ 5.90
Tepary \$2.50 @ 2.75
Garbanzos 9.50 @ 10.00
Large Whites \$5.25 @ 5.50 5.50 @ 5.75
Small Whites \$6.00 @ 6.25 6.00 @ 6.25
Limas \$14.50
do, Baby 13.00

POULTRY.

There were some advances in the price of broilers and some slight recessions in fryers. Turkeys have shown some decline, due to heavy receipts. However, prices were well maintained on the large fancy stock. Some packers and speculators declare that the price of turkeys is too high. Whether or not turkeys will be lower at Thanksgiving time is an open question. With Christmas only four weeks after Thanksgiving and the opportunity to sell for storage a month or so after Christmas, it is rash to predict low prices for Thanksgiving. The price will probably be what the people are willing to pay.

Broilers, 1½ lbs. under 45 @ 47c
do, 2 to 3 lbs. 35 @ 37c
Fryers, 2 to 3 lbs. 82 @ 33c
Hens, extra, per lb. 34 @ 35c
do, Leghorns 30 @ 33c
Smooth young roosters, per lb. (3 lbs. and over) 30 @ 32c
Old Roosters, colored, per lb. 22c
Turkeys, dressed, young spring, lb. 46 @ 48c

Special Livestock Market Report

San Francisco, Nov. 12, 1919.

CATTLE—The cattle market is stiffening up, with indications of higher prices in the near future on well-finished stock. Buyers are finding it increasingly difficult to obtain really prime stuff. Quotations remain unchanged this week.

Steers, No. 1, 1000-1200 lbs. 10½ @ 11c
do, No. 1, 1200-1400 lbs. 10 @ 10½c
do, 2nd quality 8½ @ 9c
do, thin 6½ @ 7½c
Cows and Heifers, No. 1 8½ @ 9c
do, 2nd quality 7 @ 7½c
do, thin 4½ @ 6c
Bulls and Stags, good 5½ @ 6½c
do, Fair 4½ @ 5½c
do, Thin 3½ @ 4½c
Calves, lightweight 11c
do, medium 10c
do, heavy 8 @ 9c

SHEEP—While there has been for some time past a free supply of live sheep and lambs, the run is now backing up a little, and while the market is fairly steady there is a prospect of an early rise in prices. No change this week.

Lambs, yearling 10c
do, milk 12 @ 12½c
Sheep, wethers 9 @ 9½c
do, ewes 8½ @ 7c

HOGS—Hogs experienced a sudden jump this week of 1½ to 2c in price, resulting principally from limited offerings and a sharper demand. Receipts could be much heavier without congesting the market. A rise all along the line is noted:

Hogs, hard, grain-fed, 100 to 150 lbs. 15½c
do, 150 to 225 lbs. 16c
do, 225 to 300 lbs. 15½c
do, 300 to 400 14½c

Los Angeles, Nov. 11, 1919.

CATTLE—Steers ready and in good demand. Cows dull. All prices the same as last week. Per cwt. f. o. b. Los Angeles:

Beef steers, 1000 @ 1100 lbs. \$9.50 @ 11.00
Prime cows and heifers \$8.00 @ 9.00
Good cows and heifers \$7.50 @ 8.00
Canners \$5.00 @ 5.50

HOGS—This market advances in sympathy

with Eastern markets. Receipts fair and good demand.

Per cwt. f. o. b. Los Angeles:
Heavy average 275 @ 350 lbs. \$10.00 @ 11.50
Light \$13.00 @ 15.00
Heavy average 225 @ 275 lbs. \$12.00 @ 13.00
Rough docked 20 lbs. piggy sows 40 lbs. and stage, 40 per cent.

SHEEP—Sheep and lambs selling fairly, and receipts fair. Prices unchanged.

Prime wethers \$8.50 @ 9.50
Yearlings \$8.50 @ 9.50
Prime ewes \$8.00 @ 8.50
Lambs \$12.50 @ 13.50

PORTLAND LIVESTOCK.

Portland, Ore., Nov. 11, 1919.

Special Deciduous Market Report

(Written for Pacific Rural Press by J. L. Nagle.)

On account of a large proportion of the offerings during the last week showing the effects of frost and of being overripe, prices were somewhat easier than the week previous, though the demand was by no means lessened; and we are advised that the bulk of the offerings which were considered unfit for consumption were readily bought by the wine manufacturers. Shipments have practically discontinued, except from a few districts, and we look for the season to close in about ten days.

Averages for the week:

NEW YORK—Malaga Grapes, \$2.41; Cornichon, \$2.33; Tokays, \$2.00; Emperors, \$2.10; Alicante Bouschet, \$2.71; Mission, \$2.07; Zinfandel, \$2.09; Muscat, \$1.41; B. Clairvau Pears, \$3.55; Winter Nels, \$3.70; Glout Moreau, \$3.60; Winter Seckel, \$2.60; E. Beurre, \$3.28; Comice, \$3.64.
HOSTON—Tokays, \$1.73; Malagas, \$1.15; Cornichon, \$2.03; Emperors, \$2.23; Almeria, \$2.40; Zinfandel, \$1.97; B. Clairvau, \$5.00.
CHICAGO—Cornichon, \$2.31; Emperors, \$2.21; Malagas, \$2.41; Tokays, \$1.95; Mission, \$1.90.

do, live 38 @ 40c
Geese, young, per lb. 28 @ 30c
do, old, per lb. 22 @ 23c
Squabs, per lb. 60 @ 65c
Ducks, young 28 @ 30c
do, old, per lb. 25 @ 27c
Belgian hares 10 @ 18c
Jack rabbits \$2.50 @ 3.50

BUTTER.

Butter moves slowly upward. Last week a half-cent over the close and closed at a gain of one cent for the week. The market is very firm, both here and in the East. The local exchange closed on Armistice Day, Nov. 11.

Thurs. Fri. Sat. Mon. Tu. Wed.

Extra 64 64½ 64 65 65

EGGS.

Extras this week closed at a level 3 cents below the previous week. The first drop came on Saturday and further weakness developed both Monday and today. Decreased consumption of the high-priced extras had something to do with the slump. The rapid advance with practically no recession in price was another element of weakness when the first break occurred. It is not generally believed that they will maintain their present or a lower price in the face of the eastern demand and the natural shortage of supply at this season of the year. Pullets followed the lead of extras, although the decrease was less; while undersized resisted the lower price and showed an advance until pullets sold at only slightly more than undersized. It shows that people are turning to the cheaper-priced eggs.

Thurs. Fri. Sat. Mon. Tu. Wed.
Extras 83 83 80 78½ 78½
Dirties, No. 1 78½ 78½ 78½
Ex. pullets 63½ 65½ 65½ 64 61
Undersized 60½ 62 62½ 62½ 60

CHEESE.

The California fancy flats and Firsts of that description were a half a cent higher this week. Demand is light for all grades. California Flats, fancy 31½c
do, Firsts 27c
Y. A. Fancy 33½c
Oregon Triplet 30½c
do, Y. A. 33c

FRESH FRUITS.

Apples are the favorite fruit on the market with but slight changes in prices. The Oregon product was somewhat cheaper and Pippens were somewhat higher. Raspberries were unchanged for the best, and the lack of inferior berries made the range of prices less than last week.

Apples, Jonathan \$1.25 @ 2.25
do, Spitzenberg \$1.50 @ 2.00
do, Bellflower \$1.75 @ 2.00
do, Pippins \$2.25
do, Oregon \$2.50 @ 3.25
Quinces \$1.00 @ 1.50
Pears \$2.00 @ 4.00
Strawberries \$15.00 @ 18.00
Raspberries \$11.00 @ 13.00
Grapes \$1.50 @ 2.00
Figs \$1.50 @ 1.50

CITRUS FRUITS.

Prices of citrus fruits are lower. Lemons and grapefruit are 50 cents lower for the best, and a dollar for other varieties. Tangerines sell at \$3.
Oranges, Valencia \$4.50 @ 5.50
Grapefruit \$3.50 @ 4.50
Lemons, fancy \$6.50 @ 7.00
do, choice \$5.50 @ 6.00
do, standard \$4.50 @ 5.00
Tangerines \$3.90

DRIED FRUITS.

The dried fruit market is not active, although demand continues excellent. Quotations on apples were raised a cent a pound.
Apples 15 @ 18c
Pears 16 @ 18½c
Apricots 21 @ 28c
Prunes 11 @ 13c
Figs, Adriatic 12 @ 16c
do, Calmyrna 15 @ 21c

HONEY.

Some demand for the cheaper grades of honey is developing, but the higher priced grades are moving sluggishly.

Water White 18 @ 20c
Light Amber (Mountain) 16 @ 18c
do (Alfalfa) 14 @ 16c

RICE.

There were no changes in the rice situation this week.

WOOL.

At the recent auction sales of Australian wool in London, American interests were large buyers, the finer grades being in strongest demand. There is now on the Boston market a large quantity of California short wool in the grease, for which there is a limited demand only, while manufacturers are calling loudly for the long-fibred product of Australian sheep ranges. There is not enough trading done in local wool circles to form the basis of a price quotation.

HIDES.

The hide market is weakening, and prices are receding slightly.
No. 1 wet salt kip, 15 to 30 lbs. 40c; No. 2, do. 38c; No. 1 wet salt calf, trimmed, 70c; do, untrimmed, 64c; No. 2 calf, 2c per lb. less.
Wet Salted Horse skin \$1.00 @ 1.50
Wet Salted Horse Hides are quoted as follows: No. 1 large, skinned to hoof, \$7 @ 10; do, medium, \$4 @ 6; do, small, \$1 @ 3.50; do, colts, 50c @ \$1.

LOS ANGELES.

Los Angeles, Nov. 11, 1919.

BUTTER.

This market is up again, showing an advance of 2c since last week's report. The demand is also heavy and receipts higher than a week ago. For the week, 392,800 lbs.

Fresh, California, extra creamery 66c
do, prime first 64c
do, first 63c

EGGS.

Eggs show quite an advance over last week, but receipts are lighter. The demand, however, continues good. Shipments for the week, 519 cases.
Fresh ranch, extras 70c
do, case count 74c
do, pullets 65c

POULTRY.

Receipts are lighter. Broilers reported to be in good demand, and prices firmer. Fryers steady and slow of sale. Heavy hens in good

demand but light hens dull. Turkeys and ducks are selling fairly well, but geese dull. Broilers, 1 to 1½ lbs.43c
Broilers, 1½ to 1¾ lbs.43c
Pullets, 2 to 3 lbs.32c
Roosters (soft bone), 3 lbs. and up.30c
Stags and old roosters, per lb.19c
Turkeys35@37c
Hens32@33c
Ducks25@30c
Geese27c

FRESH VEGETABLES.

All good fresh vegetables are in demand and higher prices were obtained this week for most of the offerings. Receipts are good. Potatoes, Northern Burbanks\$2.85@3.00
do, Idaho Russets, cwt.\$2.80@2.90
Sweet Potatoes\$1.75@2.00
Onions, Stockton, yellows, cwt.\$4.00@4.25

Market Comment

Are Raisin Prices Too High?

The controversy begun last September between the California Associated Raisin Company and the National Wholesale Grocers' Association, when the latter body instigated the Federal Trade Commission to institute an inquiry into the increased prices fixed for the 1919 raisin crop, is about to come to a head. Representatives of these clashing interests are proceeding to Washington this week to attend the hearings set for November 20. The fact that the entire raisin crop is practically sold out so early in the selling season would seem to indicate that the price set is not too high, under the law of supply and demand, which in the last analysis must regulate the selling price of any commodity. The greatly increased cost of production and comparison with the rising price on other commodities, more especially in the dried fruit line, would seem to bear out the conclusion that this year's raisin prices are not excessive, do not savor of profiteering, and do not stimulate a tendency to overproduction, as charged. To an onlooker it would appear that the grocer combine is merely disgruntled at a threatened curtailment of its profiteering activities.

Taboo Our Condensed Milk.

There is a keenly felt shortage of natural milk in Great Britain at the present time, the retail price of which has been fixed at 24c a quart for the winter months. (And we here in San Francisco wonder what we have to complain about when we read this statement!) Nevertheless, our American evaporated milk is not in favor there, owing to its lack of keeping qualities after the container has been opened, and it finds but little sale.

Wheat to Sell at Cost Plus—

With a view to restraining speculative advances in wheat prices and to supply millers with wheat at reasonable figures, the United States Grain Corporation will sell its winter wheat to millers at cost price plus 7 cents over for wheat in elevators and 8 cents over free on board to millers in milling zone number two, and, it is understood, that other milling zones will have the same privilege. This information comes from Chicago.

PLANT

your cover crop now

Every orchardist and rancher knows the value of a good cover crop. It loosens up the soil by adding humus. It prevents the winter rains from washing. And—if it's one of the leguminous plants such as

Woolly Podded Vetch

adds free nitrogen to the soil equivalent, on the average, to 1000 pounds of nitrate of soda to the acre.

Woolly Podded Vetch is a purple-flowered winter vetch. It grows luxuriantly and covers the ground thoroughly affording ample body for green manure. It should be planted after the first fall rains—60 to 70 pounds to the acre.

Morse's seeds are soil tested—they grow. They are true to strain, pure-bred, germinating seeds, free from all foreign matter.

Early planting yields the heaviest crops. Write today for quotations on Vetches, Melilotus, Clovers, Field Peas, etc. Write now!

Apricot Season Quite Satisfactory.

H. C. Dunlap, manager of the California Prune and Apricot Growers, says that this year the prices on apri-

cots on the average quality of deliveries will net growers up to 25c a pound. An early clean-up of the crop is expected.

Put it up to your hens!

SAY what you will, the final test of a feed is: *does it make your hens lay?* If it does that—if it makes your hens produce eggs and more eggs—and *keeps them in fine condition all the while*—then, it's a good feed.

Regularity in feeding is important, of course. But, even more important, is *uniformity* in feeding. With hand-mixed feeds you can never be sure that one batch is like another. No matter how careful you are, no matter how sure you *think* you are, you can't run away from the fact that it's *guess-work* at the best.

That's why thousands of successful poultrymen have turned to Sperry Surelay. They have found in Surelay a simple and *economical* solution of their feeding problem. They know that Surelay is not only right but *always* right—always the same. Our daily laboratory tests (something the hand-mixer does not, and can not have) assure absolute uniformity at all times.

Surelay is worked out in accordance with a *practical*, scientific formula that has stood the test of time. It is so blended

as to provide just the right amount of *protein* for the white of the egg—just the right amount of *fat* for the yolk. It contains *fourteen* distinct ingredients that every hen in your flock needs to make her a profit-producer.

Moreover, our large scale of production enables us to manufacture and *sell* the finished product lower than the average feeder can *buy* the ingredients—to say *nothing* of the cost and trouble of mixing.

After all, all we ask you to do is to put the egg-production question squarely up to your hens. Feed them Sperry Surelay—and judge its value by what the hens do for you. Let the substantial figures on your Egg Record prove to you the wisdom of using this *uniform*, dependable feed.

If you haven't a copy of our hand-book, "Makes Hens Happy" you ought to have it. For, it contains some mighty practical hints about poultry-raising and some mighty good profit-pointers. A copy is yours for the asking—simply fill in the coupon and mail today!

Examples of Dairy Production Supreme

Written for Pacific Rural Press by Thos. F. McConnell.

IT IS NOT so very many years ago that when a dairyman started out to buy cows, he was really in the dark as to what he was buying. He had to depend largely on his own judgment as to the merit of the animals he secured, as the man from whom he bought might tell him what he thought the cows would produce, but he was really as much in the dark as the buyer. Ninety-nine per cent of the production of dairy cows was a matter of guess-work and in a majority of cases the guess was wrong. Then came the invention of the Babcock test. This really simple method has revolutionized dairying. By weighing the milk from the cows and testing it by the Babcock method, we have a certain criterion by which to judge the worth of the animals. This has made it possible to know exactly what the individual cows in each herd are doing and out of this has arisen much competition among dairymen.

What Is the Best Cow?

Each and every progressive dairyman wants to possess the best cow in the State, in the United States, and in the world. There was a difference of

world-record cow for the combined production of milk and butter, owned by A. W. Morris & Sons Corporation of Woodland. She early gave promise of being a great producer, for at 2 years and 6 months she had completed a yearly record of 14,837.2 pounds of milk and 556.2 pounds of butter. At 3 years and 5 months she had produced 21,421.3 pounds milk and 841.22 pounds butter for the second year. The third year, or when she was 5 years and 1 month old, she had 30,451.4 pounds of milk and 1,189.03 pounds of butter as her yearly record. The following year she did not produce quite so much milk, falling back to 29,826.6 pounds of milk, but 1,190.46 pounds of butter resulted, which was slightly more than the previous year. The succeeding year she went back to 26,814.6 pounds of milk and 1,042.20 pounds of butter. The next lactation period, however, was the banner one, for she produced 33,425.3 pounds of milk and 1,323.02 pounds of butter in one year. She was 9 years and 2 months old when she completed this record. She is still keeping up the good work, as she has given 18,370 pounds of milk in 204 days, which yielded 700 pounds of butter.

Three Thirty-Thousand Pound Cows at the California International Live Stock Exposition, 1919. At the left: Ormsby Segis Marie, owned by Toyon Farms Assn., Los Altos. In the center: Raphaella Johanna Aaggie 3rd, owned by Napa State Hospital, Napa. At the right: Tilly Alcartra owned by A. W. Morris & Sons Corp., Woodland.

opinion among dairymen, however, as to what really constituted the best cow, after all. Many thought that the highest producer for one day was all that was needed, or at least a 7-day record was really all that was necessary to tell the story. Others thought it best to continue the test for as long a time as 30 days, but some insisted that the real test of a good cow was what a cow would produce in milk and butter both for at least one year, and from the practical side of the question the cow should be carrying a calf for at least 6 months of the year.

The one-day advocate soon disappeared, but the 7-day and 30-day period men are still to be found in abundance. Certain developments in the 7- and 30-day tests lately have emphasized the practicability of the so-called "long distance" records, and emphasized their real value as to the worth of an animal or a breed.

Three Wonderful Milk Producers.

The picture on this page is of three of the greatest "long distance" record Holstein-Friesian cows in the world ever gotten together at one live-stock show. They are a product of modern methods of breeding, feeding and testing, combined with our wonderful climate that makes maximum production possible the whole year round. The advantage is not only in the climatic influence on the animals, but the possibility of having the most palatable, digestible feeds at all seasons of the year as well.

The best-known of the three great cows shown is Tilly Alcartra, the

The total production for 6 years, exclusive of the last amounts mentioned, is 156,776.4 pounds of milk and 6,142.13 pounds of butter—over 78 tons of milk and 3 tons of butter. Certainly a wonderful milk machine and a great demonstration of what feeding, weighing and testing will do.

Ormsby Segis Marie, owned by the Toyon Farms Association of Los Altos, is a great cow, both in conformation and performance. At five years of age she made a record that places her in the list of great "long distance" performers—30,249.9 pounds of milk and 1,179.83 pounds of butter in one year is practically the same record as Tilly Alcartra at this age, and we can safely say that this cow will be heard from in future years.

The third member of this great trio is Raphaella Johanna Aaggie 3rd, owned by the Napa State Hospital, that under a strictly official yearly test produced 30,641.2 pounds of milk in 365 days. The greatest production in one day was 137.6 pounds or 16 gallons; 930 pounds or 108 gallons in 7 days, and 3,792.4 pounds or 441 gallons in 30 days. It may be stated also that this great milk machine gave over 100 pounds of milk per day for 200 days.

Proper environment, as stated above, is an absolute necessity for such "long distance" production, and while it is possible to carry out the 7- and 30-day tests, attaining maximum results in almost any section, it is easy to carry out the yearly records in California under the most equable conditions regarding both feed and climate of any place in North America.

EDITORIAL.

OUTLOOK OF FRUIT INDUSTRIES.

WE LIFT our eyes and pencils this week from the activities of the range and the pasture lot, the show-rings, barns and breedings pens, the creameries and packing establishments and the other environments of the animal industries, to the orchards, vineyards, packing houses, association headquarters and general outlook of the fruit industries. It is the glory of California that all these things are so great and inspiring of great thoughts to the industrial student, and it is the great joy of them to the industrial writer that he can turn his glance from side to side, as his publications succeed each other in unending series, and always descry visions which enwrap his attention and enable him to push a pencil with eagerness and enthusiasm. It is the surety of the coming greatness of California that the skies not only welcome to rest and recreation all those who have earned the right to dolce far niente, but the skies above and the earth beneath unite to open opportunities to those who seek recuperation and strength in action, investment, enterprise in all lines of industrial production and in world-trade in the outputs thereof. In natural endowments for production and in geographical situation for greatness in finance, manufacturing and commerce California stands without a rival in breadth, diversity and uniqueness and the recognition of these facts was never so widespread and has never prompted such eagerness on the part of those who are and those who would be Californians as at this moment.

THE WORLD NEEDS OUR FRUITS.

Various pages of this issue are given to current issues, methods and accomplishments in our fruit industries on the basis of transactions and suggestions of the great assemblies at Chico last week. In all our observation during almost half a century of its development from the period of experiment to the period of achievements which qualify our fruit industries to lead all the states and countries of the world, there has never been such confidence in the soundness of the foundations of these industries and in the opportunities for their expansion, as is now manifested. And though this is leading to all kinds of enterprises, some of which may prove illusory, as is the way with all popular rushes into particular enterprises, the general fact remains that the world needs fruits, and California has the early start, the maturity of research and of experimental knowledge and the inventive achievement in production and distribution, which now underlie leadership and guarantee continued possession of it. Such was the spirit which illumined all the assemblies at Chico and prompted most confident expectation and resolution for increasing effort. We need not now cite the facts and foresights by which Californians exhort each other. They are our current promotive materials, which are disclosed whenever a fact of new achievement in production, in co-operative attainment, in sale and distribution, or in scientific research which dictates better methods of operation, is announced. It

is our weekly privilege to proclaim such facts. Apart from these, and supportive of them, was the declaration of Dr. W. T. Swingle at one of the meetings. Dr. Swingle is the country's greatest globe-trotter in the realm of horticultural science. He has served the United States Department of Agriculture for more than twenty years as explorer in all parts of the world, and has given close scrutiny not only into what American states and foreign countries have, but what they lack, and it is his judgment that the world is meagerly supplied with fruits and fruit products and will absorb everything good which can be successfully carried, in fresh or preserved form, of the fruits which our soils and climate are capable of producing. It is his careful judgment that in a few years we shall be not only delivering our fruits, which are now great, not only in vastly larger production, but will be shipping trainloads of some fruits which are now rather small, like figs and dates, in as large volume as we are now sending peaches, prunes, oranges and grapes. Dr. Swingle can see no chance whatever of over-production of the unique fruits to which this state is adapted if we proceed progressively in the distribution of such products as we have during the last few years. One only has to see how little of such fruits the world really has and how eager the world is to have them at such prices as we are able to profitably produce them to invite general consumption.

HOW SHALL WE GET BETTER FRUITS?

On another page are given some details of an undertaking projected by the California nurserymen to insure the production of trees which shall not only be true to their names and types, but shall be the best of their types. Out of respect to the prejudices of many planters that nurserymen are men born and reared without ethical elements, we have announced their conversion to moral sense and repentance of past transgressions by the declaration that henceforward "they will try to be good." Perhaps they have not hitherto always been as careful as they should have been and perhaps there have been bad nurserymen just as there are other bad people—but all that does not matter now; they are now on the anxious seat and propose to bring forth fruits meet for repentance. And so we say: "Welcome, brothers, to the household of faith; get the buds of higher types of morals into your stiff necks and grow your roots clean of the knots of deceit and your rise to the heaven of industrial trust and honor will be sure!" But there is more in the proposition than trying to sell the planter what he expects to get; it aims to furnish him things which are better than he has ordinary reason to expect, because it will be better than he usually knows. It really looks as though the resolution of the nurserymen to get together and propagate only from trees authoritatively and disinterestedly declared by experts to be the best and most productive of their kinds, is the most fundamental movement toward realizing the production of better fruit that can be conceived of. Scientific determination of which are best and most productive is a fundamental fact, of course, but fundamental movement must come from those who are growing trees for planting. We are quite in sympathy with the declaration of the new president of the association, J. E. Bergtholdt of Newcastle: "I dare say that in five or ten years the most important event that took place in this convention of fruit growers and farmers will be found to be the organization created by the nurserymen for the purpose of selection of the best and elimination of the bad in our fruit production."

We count the declaration of such intention and the procedure at once to realize action, as our report shows in another column, may really be the greatest offspring of the Chico convention.

THE LABOR QUESTION.

The discussion which was expected to strike most sparks in the meetings was the labor question involving the attitude toward the Japanese problem. The latter was thrown into the convention in the address of welcome by the mayor of Chico, and he urged strenuous action to check Japanese aggression. James Mills of Hamilton, who responded to the address of welcome, is credited with saying: "In recent years many farmers could not have har-

vested their crops without Japanese aid. The Japanese are here in many cases because we have failed to measure up to the responsibilities of the situation, and some solution will be found for the problem."

This temperate statement seemed to satisfy the convention, for the discussion was not pursued and the resolutions committee presented nothing on the subject. The Nurserymen's convention received a telegram from Senator Phelan suggesting that they call for a special session of the legislature to handle the Japanese problem, and that they declare a boycott against Japanese products. The nurserymen called for the extra session, but did not approve a boycott. On the last day of the main convention at Durham, Col. Irish made a strong defense of the Japanese as good farmers and moral beings—having higher standards of conduct than some white people—and contributing notably to the development of California. The audience heard Col. Irish with silence because of his personal popularity and esteem for him as a man, but they were not at all in harmony with his views as to the desirability of their presence in this state. An Australian prominent in public affairs of his country remarked subsequently in private conversation: "I find in the attitude of this convention toward such a speech as that of Col. Irish a remarkable instance of American toleration of which I have heard. His views and claims would cause an Australian audience to drive him from the platform." We are not sure that the Australian is quite right; he probably credits Americans with much more toleration than all their assemblies would manifest. Farmers are very tolerant and will listen silently to many things they do not approve, because they desire to be unjust to no man or thing. It is true, as Mr. Mills suggested, that many of our producing industries have no visible means of proceeding without them. Some farmers are strongly opposed to them; many more regard them as a necessary undesirability under present labor conditions, and a few consider them intrinsically desirable, as Col. Irish does. But probably all farmers desire to have them treated fairly and to dispose of the serious problem which their presence involves in lawful American ways, and not to attempt to solve it by industrial persecution. So far as one can judge by the attitudes of the various assemblies during the Chico convention, California farmers are, with practical unanimity, resolved upon building up this nation on Caucasian elements of population, and prefer to give employment to people of that race whenever they can be found in sufficient numbers and with the will to meet the requirements necessary to get the crops upon which depends their success as food producers.

FARMERS REFUSE CONFERENCE.

Samuel Gompers, the accomplished head of the American Federation of Labor, has fallen out with the ruling family in America—the Wilsons. President Wilson gave him only one finger in a handshake after Mr. Gompers endorsed the coal strike; Secretary of Labor Wilson gave him only two fingers, and declared that the strike must stop before arbitration could begin. And now Oliver Wilson, Master of the National Grange, refuses to even hook thumbs with him on his proposition that this great farmers' national assembly go into cahoots with the Labor Unions for the good of the two of them. And Oliver Wilson makes his reply somewhat emphatic, thus:

"The demand for shorter hours on the part of certain classes of labor is indefensible. On the contrary, more and harder work is the cure for many of the Nation's ills."

"One of the imperative necessities of today is to put emphasis upon the sacred rights of property as opposed to the wild orgy of radicalism, nationalization and anarchy, which are sweeping the land and threatening to destroy every industry, every farm and every home."

"I cannot, for my part, see that such an alliance as is proposed would be of any benefit to the Grange. On the contrary, there seems to be many reasons why we should shun any merger. However, that is a question which will have to be passed on by the Grange as a whole."

And the Grange did pass upon the proposition as a whole and passed upon it wholly also, for the assembly adopted by an overwhelming vote the following resolution:

"The National Grange declines your invitation for a conference in Washington December 13."

To explain the curtness of the resolution, it was

stated that discussion of reasons for refusal would open endless controversy and to attend the Washington meeting would be a tacit admission that there were mutual interests. And so the National Grange "cut off the dog's tail just back of the ears"—and farther comment is unnecessary.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Sweet, Sour and Bitter Clover.

To the Editor: Just what plants are meant by the terms, "sweet clover, sour clover, and bitter clover"? It is my understanding that melilotus alba (with white blossom, grown for stock feed) and melilotus indica (with yellow blossom, rather inedible but fine for cover crop) are both called "sweet clover," and the latter is also called very often, "sour clover" and sometimes "bitter clover." A neighbor, reading an article about cover crops, thought that sour clover meant bur clover, which I never knew had any other name but its scientific name.—W., Exeter.

You are exactly right. The white and yellow-flowered melilotus are both called "sweet clover" at the East because of their fragrance. But the yellow-flowered species there found is melilotus officinalis, while the yellow-flowered one we have most to do with in California is melilotus indica, and that has been given the names "sour" and "bitter" because of its taste. Bur clover has no such name and does not deserve to have. In fact, bur clover is not a melilotus at all, but is a medicago, and is therefore more closely related to alfalfa than to any of the melilotus, of which there are fifteen or more species scattered over the world.

Spring or Fall Plowing.

To the Editor: Which is the most beneficial—spring or fall plowing?—F., Biggs.

Neither is clearly superior under all circumstances and conditions. If you have land which is pretty well on edge in a place where rainfall is heavy and erosion dangerous, or if you wish to get all the natural cover crop which will grow, it is better not to plow in the fall, but let the weeds hold the land until they get to be as high as you can plow under and this will be late in the winter or early in the spring. On the other hand, if you wish to start a cover crop by sowing, it should be put in as early as practicable in the fall. Also, if your rainfall is not excessive and you wish to save run-off and get as much moisture into the ground as you can and there is no great danger from erosion—then again fall plowing and leaving the land rough is also best. And there are many other conditions and purposes which may make either fall or spring plowing superior on particular places, so there can really be no rule. It is up to every man to look and think closely and decide for himself which is better for his land. In a general way it may be said that fall plowing gets most moisture into soils which are disposed to yield run-off if left hard. It is also true that spring plowing, as a rule, is capable of losing considerable moisture by evaporation, which in many cases cannot be spared.

Looks Like Barley Hay.

To the Editor: I have about 20 acres of land which is gravelly on top of hard pan. It grows good grass in the spring, but it gets very dry in the summer. I thought to sow it in barley, or wheat. What do you think would be best to sow on it?—G. M., Baird.

It ought to give you barley hay—possibly grain if the moisture holds late. You must judge whether to cut for hay or hold for grain by the way the plant looks in the spring. There are some new barleys, like Mariout, which are showing superior drouth resistance, but we understand there is no seed to be had this year. Common barley will do to see whether you can get more from the land than winter pasturage.

Pears and Blight.

To the Editor: Are all varieties of pears equally susceptible to blight? If not what are some varieties that do not blight and what is their commercial value as compared with the Bartlett?—W. E. L., Dinuba.

Pears are not all equally susceptible to blight, but there is no blight-immune pear which is worth growing except as a root for the Bartlett and a few others which suit commercial purposes.

Farmers with Strike Feeling.

To the Editor: I am on a strike; the world does not realize it, but I am, just the same. I am sending you my subscription, but do you know that three-quarters of the farmers are quietly quitting on the output of food? The labor problem has driven them to it and before another year rolls around more of us will know that the farmer went on strike with other labor organizations. The fever is catching and when the farmer gets it, believe me, it is going to hurt somebody.—J. B. K., Wrights.

Yes, we know it, and are sorry for it, and we are doing our best to arouse the people to the fact that farmers must be better treated if the world is to be well fed. But "quietly quitting" is not a "strike." A strike is to quit loudly and try to break the head of anyone who chooses to go on with the job. Every man has a right to quit if for any reason sufficient to himself he decides he cannot go on. Striking is interfering with the rights of others to go on if they choose. Farmers will not do that: they are too individualistic and independent and like to have their own way too well to refuse the same right to others who are also individualistic and independent. Farmers may have to quit quietly and regretfully because they cannot go on, but they will never strike.

Elephant Grass.

To the Editor: I was recently given a half dozen roots of Elephant grass. Will you kindly tell me the treatment it requires, and something of its characteristics and value?—J. H., Campbell.

Plant out the roots wherever you desire them to grow—remembering that it is a very coarse-growing plant and is about as far from making what we ordinarily look for as a "growth of grass" as a fish-pole is from a tooth-pick. For this reason set the roots not less than three feet apart each way and let it go to a height of twelve feet or more if it finds moisture enough in the soil. The top growth is cut by the frost, but the roots are hardy. It is rather a browsing than a mowing plant and new growth soon starts all through the frostless season if the stock is taken off to give it a chance. They eat it down to a stubble several feet high and new growth starts from this stubble and by new shoots from the roots. It does not make running roots and can be easily chopped out if you get tired of it. It is of course a summer- and not a winter-feeding plant in most places. It is readily eaten by stock and is nutritious. Full discussions of the plant were given in the Rural Press of March 20 by Prof. Kennedy and of October 25 by Mr. Hodges.

Grafting Olives.

To the Editor: I wish you would kindly advise me if you think it would pay to graft the large olives on the little olive trees. I have trees of the small olives which are not very good. What time of the year do they graft trees?—Mrs. B., Volta.

You do not say what variety of olive you have, nor how small it actually is. If it is the "Ralding Picholine," which is about the size of a "large white" bean, you should either graft over the trees or grub them out. If your olives are the Mission (which is a small olive as compared with Sevillano or Ascolano), we would have the trees pruned and fertilized and irrigated so they will bring fruit of the full size of their kind and not have them grafted. If you decide to graft be sure to get a grafter who can show by his previous work that he knows how to do it. Olive grafting is best done about the time new growth is starting in the spring—in April, perhaps. It is done later than grafting of deciduous fruit trees.

Cure for Wormy Apples.

To the Editor: I have 75 apple trees. Sprayed them last December with Bordeaux Mixture, but the apples were still wormy. What is the right mixture, and when should I spray, and how often so as to kill them.—N. O., Antelope.

Bordeaux mixture is to kill fungi, not insects. Of course, some eggs might possibly be caught in it or some tiny hatchlings from the eggs might find it hard biting, but it is not at all dependable to protect your fruit from codlin worms. You should spray with lead arsenate (two pounds to 50 gallons of water), as soon as the petals begin falling from the blossoms; spray again in four weeks and perhaps once more, four weeks later. If this is well done with a force sprayer, which drives a fine spray into the clusters of young fruits and covers the leaves thoroughly, you ought to get nearly all your fruit free from worms.

Which Barley?

To the Editor: Please tell me through your paper which of the three following kinds of barley is the best yielder—common, Mariout, or beardless barley?—Subscriber, Porterville.

The Mariout (as shown in our issue of August 9 in detail) has considerably exceeded common barley in yield in interior situations under rather dry conditions. But this will not help you this year, for we understand that all the available seed was disposed of soon after the desirability of it was brought to the attention of our readers. The common barley is probably the best you can do, and that has been shown by many years of experience to be much better than beardless under average conditions, though some advocate the latter because of their liking for beardless hay, probably.

An Uncomfortable Guava.

To the Editor: I have a guava bush six years old that, while it looks healthy, grows very slowly and puts out fruit buds every spring which hold on several weeks and finally drop off without unfolding. What is the cause? It is in protected location in the southeast angle of the house.—C. J., Campbell.

When a plant makes slow growth and refuses to unfold blossoms, when moisture and soil conditions are favorable, such behavior is usually attributable to insufficiency of heat in the local climate. Even if you get a corner on the sunshine and it gets nearly to burning for a time, that does not compensate for the continued warmth which the plant may need through the whole day and night. There is much difference in guavas: some are quite hardy and others nearly tropical. You apparently have a kind which is not suited to its environment and there is probably no help for it.

Cleaning Tree Bark.

To the Editor: Am enclosing some species of moss found on my apricot trees. Please give me a formula for the best spray to use, and when is the best time to apply.—W. C. B., Santa Paula.

You send two species of lichens: one flat, the other branching and pendulous. Both are common on trees in the coast region and go under the general name of "moss." If that is all you have to spray for the simplest formula is one pound of caustic soda to six gallons of water—shot against the bark with force to secure penetration of the covering. If you have scales, either lime-sulphur or distillate emulsion will kill scales and moss also. The time for treatment is when the leaves are absent.

Almond Mites and Gum.

To the Editor: Our almond orchard has the white mites, and also shows some gum. Would it be best to spray this fall? If so, what is the best spray to use?—H. P. S., Durham.

To proceed intelligently you ought to know what causes the gumming. It may be that you have scales as well as mites, or the gumming may not be caused by pests at all and will not be helped by any spray; or it may be caused by a fungus blight. The best you can do to get the eggs of the mites and perhaps to head off a blight, will be to spray with lime-sulphur as soon as the leaves are down. For these troubles you must also be on the watch next spring and use the same spray in more dilute form.

Chickens and Almonds.

To the Editor: Is a young almond orchard, that is just beginning to bear, a good place for chicken pens?—J. B. W., Winton.

It is a better place for chickens than it is for chicken pens. The danger is in souring the soil by lack of aeration and by excess of manure in spots. If you move the pens frequently and keep up the cultivation and do not continue the practice too long it ought to be good for the trees.

CALIFORNIA WEATHER RECORD

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending November 17, 1919.

Stations—	Past Week	Seasonal To Date	Rainfall To Date	Temperature	
				Highest	Lowest
Eureka04	3.38	6.45	62	40
Red Bluff00	1.06	3.87	76	38

Fruitgrowers and Farmers' Convention

(Written for Pacific Rural Press.)

Three Butte counties were en fete last week to welcome and speed the transactions of three State associations serving the fruit-growing interests. The towns were Chico, Oroville and Durham, and the conventions were of fruit growers and farmers, of county horticultural commissioners and of nurserymen. In fact, about all our agricultural industries participated in the events of last week, except the live stock specialties, and they had previously had their innings in connection with the live stock shows at Los Angeles and San Francisco, and the proceedings at their exhibitions and assemblies have been amply set forth in the Pacific Rural Press. To one who has participated in all these important events, both of the animal and of the orchard, vineyard and field, the impression comes that California agriculture is very much alive—and such was the verdict of several visiting farmers with whom the writer conversed at the conventions of last week.

The conventions in Butte county also demonstrated that the non-farming population of California is sincere and active in its good will toward our

farming interests. The Chico and Oroville Chambers of Commerce undertook the local arrangements for the meetings and neglected nothing which would contribute to the success of the assemblies and the comfort of individuals. The sessions were held in the auditorium and class rooms of the State Normal School at Chico, and the interested participation of the pupils in the transactions of the elders demonstrated that our youth is being brought up in the way it should go—toward proper appreciation of the facts of our agricultural operations and the spirit which actuates them.

The attendance at the groups of meetings held by each of the three conventions was very good and representative. The joint assemblies included at least five hundred; the hotels were overflowing with guests from all parts of the State and the leaf-strewn streets of the residence districts were filled with groups of ribboned strangers enjoying the autumn aspects of one of California's most beautiful towns, which mingles the old trees and buildings of the pioneers with the up-to-date creations of the newer residents who have ministered to great recent developments.

Striking Features.

It is not the writer's intention to undertake a detailed record of the proceedings, but rather to emphasize features which seem to be of general interest through our widely-scattered constituency. Of such we count the general success of the Chico sessions—as already indicated by the character of the preparations and the eagerness of interest in the proceedings. Many transactions of the general assembly, of the commissioners and of the nurserymen will be reserved for subsequent discussion in these columns.

Aside from the Chico specialties, the success of the day at Oroville, where the popular welcome to the visitors was most marked and cordial, was very significant—perhaps especially the participation by Mrs. Frieda Ehmann, who was hailed as "the inventor of the ripe olive," whose historical address was very interesting. Of course, Mrs. Ehmann was not the inventor of the ripe olive, but she surely began early and kept on until it stayed invented, and she is surely entitled to say these things about it:

"The ripe olive was looked at askance by dealers because 'it is as black as your hat.' Today the ripe olive is not a stranger. If you will keep the ball rolling we will have a great olive trade from one end of the globe to the other, and we won't stop until we can say that wherever there is a white, civilized person we will not have to apologize for the blackness of the ripe olive."

At the Oroville meetings there were talks bringing out many pertinent cultural points of which C. C. Teague's advice to citrus growers at Oroville is of very wide application. "From what I saw in one orchard," he said, "you do not yet understand fertilization. One grove I should immediately treat with ten tons of barnyard manure to the acre and next spring put on some good soluble organic fertilizer. The owner would immediately see wonderful improvement." This comment, if acted upon, will produce most desirable results.

At the Durham meeting, which closed the week, there was a very gratifying demonstration of the State work in colonization, which has been pointedly set forth in our columns by Mr. Hodges as observed by him during a recent visit and our readers are well informed of the purposes and methods involved.

The Convention Attacks Great Questions.

The first session of the general convention at Chico struck the keynote of many stirring transactions at later sessions, both at Oroville and Durham. It was the old and yet ever-young subject of co-operation among producers to secure whatever their industries need. Many of the most successful co-operative marketing and supply associations submitted up to date reports of their transactions and their lessons of experience. Some of these are presented on other pages of this issue and others will follow.

The central proposition on co-operation was that of State Director Hecke, which was presented in detail with comments in our last issue for an affiliation of all our associations in an executive board or committee which should represent and act for them on all matters requiring legislation or to educate the public mind. Mr. Hecke's proposition was enthusiastically taken up by the convention, and a temporary organization committee was appointed, of which C. C. Teague of Santa Paula, president of the Walnut Growers Association, is chairman. F. B. McKevitt of Sacramento will act as secretary during the organization period. This committee will extend an invitation to all co-operative associations to send delegates to a general meeting for organization, which will be held in San Francisco on December 12. It is expected that the finally constituted board or committee will select a qual-

ified executive secretary, establish offices, etc., and that funds will be provided by the affiliating societies pro-rated on the basis of the business done by them. Thus it now seems feasible to secure a representative correlated body to promote the executive agriculture of the State and to determine main directions in which State effort for agriculture shall be undertaken.

Nurserymen Will Try to Be Good.

The most notable thing of public interest in the transactions of the nurserymen was their sincere desire to conduct their business for the best promotion of fruit growing and the prosperity of tree planters. This was manifested by many representative speakers and the resulting question was as to how this can best be done. President W. T. Kirkman presented a plan for a co-operative organization, to be supported by both planters and nurserymen, to select the best trees of all kinds of fruit by an expert and staff engaged for that purpose, and to use in nursery propagation only such buds and scions as such expert shall designate as true to type and from trees of established thrift and productivity. A committee was appointed to organize for such effort and to provide a capitalization of \$100,000, to promote the work of such an organization and to provide a constitution and by-laws and a plan of work for it. The committee consists of J. E. Bergtholdt, Newcastle; George C. Roeding, Fresno; H. A. Hyde, Watsonville; Max J. Crow, Gilroy; J. E. Elmer, San Jose; J. S. Armstrong, Ontario; W. T. Kirkman, Fresno (ex officio.) The committee will proceed at once with the work.

This great enterprise started by President Kirkman will be energetically pushed by J. E. Bergtholdt of Newcastle, who was elected president of the Nurserymen's Association for the coming year. Other officers elected were H. A. Hyde of Watsonville, first vice-president; W. H. Wood of San Dimas, second vice-president; L. H. Elmer of San Jose, third vice-president; James Mills, Jr., of Hamilton City, fourth vice-president; George C. Roeding of Fresno, fifth vice-president, and Henry W. Kruckeberg of Los Angeles, secretary-treasurer. The board of directors for the coming year are: J. E. Merriweather of Ontario, chairman; R. M. Teague, Leonard Coates, W. T. Kirkman, Jr., and H. J. Shearer.

The County Commissioners.

The county horticultural commissioners, as usual, preceded the assembly of the general convention and occupied two days with careful discussion of their duties, which under the newer horticultural laws, are constantly increasing and becoming more exacting, both of technical knowledge and of executive ability. As a matter of fact, the county commissioners have become a body of highly qualified and proper-spirited public officers, whose work is greatly promoted by their annual assemblies for comparison of policies and methods. After their work in this line the association elected officers for the coming year as follows: G. R. Gorton, Commissioner of San Diego, president; A. A. Brock, Commissioner, Ventura, vice-president; Fred C. Brostius, Commissioner, Sacramento, secretary.

The association designated the following as the chief lines along which its work should proceed during the coming year: support to the Director of Agriculture; favoring pure seed legislation to prevent dissemination of noxious weed seeds; and asking the State Highway Commission to wage war on weeds and rodents existing along the State highways.

Recognizing this disposition of the horticultural commissioners to do progressive work, the general convention adopted a resolution advising that the compensation of county horticultural officers be advanced to cover the higher cost of living and to manifest fuller recognition of the value of such officers.

"It's A Good Sign"

"Here Jim—you deposit these checks while I run in here for more Hercules Dynamite."

"I tell you, it was a lucky day when Dad first started using explosives for tree planting. Half the checks in this book are for the crop from our young orchard and that orchard wouldn't be bearing for two years if we hadn't planted it with the help of

HERCULES DYNAMITE

"Trees planted in blasted holes take hold better, grow better and bear sooner than those planted in spade dug holes. And what's even better—you save more than half the labor in planting."

"Every orchardist and farmer in the community should use dynamite to help him in his heavy work, and he would if he had read 'Progressive Cultivation.'"

"This book tells all about the uses of explosives for farm and orchard work. It gives explicit directions, illustrated by photographs and diagrams, for the proper use and handling of dynamite. This book will be sent free to any farmer or orchardist who will sign and send in the attached coupon."

"THE use of Goodyear Cord Pneumatic Truck Tires on my truck has saved me a great deal of time and money. They are an economy all around in general farm work and livestock hauling—especially over farm land and rough, slippery country roads."—Mr. W. H. Duley, Livestock Farmer, Starks, Maine

THE photograph above was taken January 3rd, 1919, on the livestock farm of W. H. Duley, ten miles from Starks, Maine.

At that time Mr. Duley told us that he had been hauling on Goodyear Cord Pneumatic Truck Tires during weather that had stopped local solid-tired trucks.

The tractive Goodyear Cords had enabled his truck to overcome fierce road conditions

and, in addition, to pull solid-tired trucks out of mire and up stiff grades.

The easy-rolling Goodyear Cords had enabled his truck to average three and four trips to town per day, an amount of hauling which would have required three teams.

The cushioning Goodyear Cords had enabled his truck to deliver decidedly good mileage on gasoline and oil and to re-

main in excellent mechanical order despite the bad going.

On top of all this, the tough Goodyear Cords had outlasted neighbor's solid tires which wore down rapidly due to spinning in the gravel on the steep hills.

This latter performance particularly reflects that long pioneering work with which Goodyear has developed Goodyear Cord Pneumatic Truck Tires for very severe hauling duty.

Shall Growers or Buyers Fix Prices?

(By Dr. F. M. Coleman, California Prune and Apricot Growers, Inc.)

The California Prune and Apricot Growers, Inc., will not handle the 1920 or 1921 crop of prunes and apricots unless 20,000 acres of prunes and 6,000 acres of apricots additional to those now controlled by the 8,000 members of the association shall have been signed up before expiration of the present contract, March 1.

This statement is contained in a resolution of the Board of Directors November 12. It is not expected that the association will go out of business; but it behooves all who have benefited by its existence to get busy convincing non-members that they ought to sign up. Organization Manager H. C. Dunlap states that there are 80,000 acres of prunes bearing now in California. He estimates that 14,000 acres are coming into bearing annually and that apricots are coming even more rapidly in proportion to their bearing acreage.

Where the buyers are many to one seller, the seller makes the price; and where the sellers are many to one buyer the buyer makes the price. The price maker always shades it to his advantage as far as he can, and in both cases the food grower, until recently, was not the one to fix the price.

During the ages there has grown up a vast system, which deals in the interchange of finished products. These traders are not producers, but distributors doing an important work between producers and consumers. Like all other workers they do business for their own gain, and exercise all their ability to make their profits maximum.

When profits of merchandising grow large, the numbers of merchants multiply and their struggle to enlarge their gain can succeed only as they can subtract from producers' price and add to consumers' cost.

The function of this merchandising class as distributors is quite necessary, but every unnecessary distributor who can be changed to a producer enlarges the sum of products, and lessens unnecessary tax in price between producer and consumer.

The modern movement in which growers organize, is to unite the function of distributors, at least partially, with that of producers (to keep the financial advantage of both functions as far as can be with the producing class). Not simply to add the profits of legitimate distribution to that of production, but mainly to prevent the system of distribution from destroying the legitimate profits of production.

Our claim is rather that the non-productive middlemen or merchandising class can and do so manipulate the business of distributing products as to take from the grower-producer the profit which rightly belongs to him, and add unnecessary cost to the consumer with which to swell merchant gains.

We do not hold any philanthropic brief to defend the consumer against excessive cost, and may admit frankly that our real desire to lessen cost to the consumer is all because of its reflex benefit to our end of the enterprise. We do not pretend that we desire to contribute a part of our possible profits to the consumer, but we do want to hinder the middleman's unnecessary tax on the consumer, because it hurts us by reducing consumption.

Individual Grower Is One of Many Sellers.

The average grower of any kind of food product provides but an infinitesimal fraction of the commercial whole. And the first commercial step is to accumulate many of these little fractions in bulk quantities of commercial size. Ten thousand growers sell each his handful to one of fifty accumulating middleman distributors. And just here is the fatally weak point in the growers' commercial relation to the old system. He must sell his handful to one with the power and purpose to pay the minimum. It is not the buyer's fault. It is his opportunity. Given power to fix the price it will be fixed in the fixer's favor.

Now note the essential difference in the conditions of co-operation. Each one of these ten thousand growers brings his tiny fraction—not to sell to an unfriendly buyer at the buyer's price—but to put it with all the rest into the hands of a friendly seller, who with control of the whole product, goes to the world's markets with power and purpose and price favorable to the producer.

The grower's sense of defenseless helplessness is changed to the consciousness of power to enforce his just claim to reasonable profit. He is asking nothing more for himself than he has always conceded to the seller of whom he buys—that is, the right to name the price of what he sells.

Certain Facts Are Accepted as Self-Evident.

Combination multiplies power.

Power's first profit is to its possessor.

Power's chief danger is not to its possessor.

Power can and should be used to correct evils and promote the greatest good to the greatest number.

Notice other facts. The only real criticism of growers' combination for co-operative marketing is that they may become dangerous monopolies. But all will admit that this assumed danger is not to the grower. But is there danger to any in this new power of growers' combinations? An unprejudiced analysis of all the facts involved proves conclusively that the growers' control of the market price of his product carries no threat of oppressing the consumer. For it is easy to show that the consumer's favor is the grower's salvation.

But if co-operative marketing adds to growers' profits without adding cost to consumer, who loses what the grower gains? Some way the middleman's gains must shrink as much as the growers' profits swell. We do not blame him for the deadly grip with which he holds to his ancient privilege; neither can he hope for much pity when the grower intelligently accepts his opportunity to take it away from him. Mankind in general will be the gainers when every superfluous non-producer is forced to join the ranks of useful production.

Organized co-operation is the only way to adequately protect and promote the growers' industry. To keep market demand equal to production is necessary in order to keep production profitable. And it requires as much intelligent effort to provide profitable market as to produce the product. The individual grower can develop production to its superlative degree without organized co-operation. But alone he is utterly helpless to improve marketing conditions.

Value of Expert Advertising.

Expert advertising is the best-known and most dependable means to increase consumption. And effective advertising is only possible when supported by the combined industry. Two hundred thousand tons of raisins are not heavily taxed to spend four hundred thousand dollars in advertising—about one per cent of present value. One per cent from the average grower would pay for about two lines in one of our journals of greatest circulation. New markets are usually won at very heavy selling expense, which no single individual can afford. But taxed to the whole industry the cost to each is light.

High grade quality helps to sell any commodity. And quality is determined in the articles' production. But one grower among ten thousand can not imagine any effect his little can have upon the whole. Its identity is entirely lost when mingled with all. Working alone, his best effort counts for nothing; and with no reputation to make or lose, in the general trade, he has no incentive to care. But when

Dependable Pumping Plants

When you install a pumping plant you want water—plenty of water—full-rated production and more, if possible. And that's what you get when you install

American Centrifugal Pumps

These pumps produce the full guaranteed amount of water and they keep power bills down to a minimum! That's more than a claim—it's a guaranteed fact.

united with all others of his industry in a common purpose, with declaration from central authority that quality will pay and nothing else will pass, then he has sufficient inducement to produce quality goods.

The most outstanding trend of present industrialism is toward combination for increased class or collective power. Because of this must the lone individual lose his equality of opportunity. His best hope of industrial salvation is to join his class and

Meet Combination with Counter-Combination.

A method or attitude which met the need of past conditions will not satisfy the demand of present conditions. The successful marketing of our products can never be attained except by means derived through the power of great numbers of sellers combined into one seller who has power to name the prices which will move crops to consumption with the least waste en route.

A Man-Sized Job for Co-operators

(By President G. W. Pierce of California Almond Growers' Exchange.)

As a specific example of the accomplishments of co-operative action among producers we cite the case of the California Almond Growers' Exchange. In existence nine years, it has grown to a membership of thirty-two hundred. Annually, at date of price-setting, the books are closed to applicants for membership to participate in that season's sale. This year the desire to get in later has been so strong that more than two hundred late applications for membership have been received. While each year the several almond-growing sections are canvassed for members, there are always some who decline to become members. The fact that so many came in late this year would seem to indicate that late repentance is caused by unsatisfactory treatment at the hands of the speculator. This latter chap is just as unscrupulous today as twenty years ago. He is held in check today by the co-operative organizations. On each transaction he goes just as far as his tether will permit him. Along this line the organizations have done their part. They are still handicapped by the action of the outside grower; and the future complete success of co-operative selling, which really makes it possible to have anything to sell, must depend upon an educational campaign among independent sellers.

Bait for Outside Growers.

The great bulk of the almonds purchased outside of the Exchange are bought at prices that range from forty to eighty dollars per ton below the prices received by Exchange members for the same grade of almonds. A very few in each locality, late in the season, are paid extreme prices, as a bait to keep the rest in line for the next season's business. This season's experience is convincing many that they have long been imposed upon. They are turning to the Exchange to secure the justice that is denied them in the open market. Give the Exchange a one-hundred-per-cent organization and it will protect the California grower against even the cheapest imported product.

While the Exchange members are preparing in a substantial manner to take care of the almond business in all its branches, securing land, building warehouses, and installing modern machinery, while they are fostering national legislation looking to the benefit of our condition and fighting adverse measures, what is the outside grower doing for the business? While growing and harvesting a crop of almonds is the most important part of the business, it is far from all of it, and the annual expense incurred in trying to make this plain to all the growers is no small burden.

The independent seller, aside from his failure to co-operate, is a detriment to the business. He is a negative quantity that must be overcome by the efforts of some loyal producer before the latter can really begin to build up his organization.

Just what line of argument induces a grower to become so blind to his interests, it is difficult to surmise. In the early days of co-operative work, when the organization was not as strong financially as now, it could not pay growers as promptly as they are

paid at the present time. This fact was then worked threadbare as an inducement to remain outside. Now it has lost much of its effectiveness because of the practice of the Exchange in paying about fifty per cent of the value of the product on delivery. This is followed by other payments, at short intervals as the crop is moved.

New Move to Kill Co-operation.

We have retired the speculator. Let us now turn the light of day upon the petty grafter and make him a thing of the past in so far as the marketing of our produce is concerned. With a firm hand on the marketing end of our several lines we can free ourselves from the suspicion that now exists, that we are profiteers. That this suspicion exists, there is no doubt, and our apathy in the matter adds converts to the belief.

Within the last month a call was issued to the Mayors of 145 cities of the Pacific Coast, to convene in Sacramento with the avowed purpose of formulating a plan for boycotting certain farm products. These official representatives earnestly discussed and favored the enactment of such laws as would put every co-operative selling organization in the State out of business. They invited chaos. They even went so far as to petition Governor Stephens to convene the Legislature in special session for immediate action on the proposed measures. Had this scheme worked to a successful finish, what would it have meant to the producing classes?

At the Mayoralty gathering referred to, only two producers' organizations were represented, and that representation was accidental. It was proposed to close the market to three-quarters of a billion dollars' worth of annual farm products in California. Back of these enormous accumulations, representing the sole income and dependence of our entire farming population, came a mere chance defense. Luck, rather than foresight, saved the day. It so happened that our very able and active State Market Director, Col. Harris Weinstock, dropped in at the meeting. In his very forceful manner he did much to help defeat the pernicious measure.

This attempt to make us responsible for the sins of others has been temporarily tabled, but at the next session of the Legislature, if we mistake not, this measure will be revived with conditions more drastic, if possible, than those contained in the original. Are we, as representatives of the producers, going to be prepared at that time to make adequate defense? Can we afford to let so important a matter drift, to be taken care of by chance defence?

Beside this defence and possibly more, there will be much constructive work needed at each recurring session of the Legislature. To successfully meet this we should have a central representative body, composed of delegates from each organization connected in any way with the production, handling or marketing of California-grown food products. The findings of this body should be cared for, and our interests furthered by one or more persons skilled in Legislative procedure.

Learn from Union Labor.

It is a trite saying that the farmer does not realize his strength. Co-operative methods are fast revealing the secret. It is now on the tongue of every progressive farmer. The power and possibilities revealed to date are greater than the most enthusiastic had ever anticipated. We cannot

justly take unto ourselves, however, the credit for having solved the problem. Union Labor did that, and applied the newly gained information, for its own benefit, in so vigorous a manner, that in self-defence we have been compelled to adapt the formula.

Union labor, our instructor, is burdened by the possibilities revealed. It cannot judiciously use the vast fund at its disposal. But this is no cause for wonderment. Suddenly acquired riches are frequently mispent. The child does not overeat confectionery because it wants to be sick, but because it likes the candy.

The attempt to openly defy our government, now being tried, by Union labor, is ill-advised. Our instructor is showing us by example what we ought not to do. He is working out the proper status of this new govern-

mental factor. Experiments are frequently expensive and sometimes disastrous. Our position at this time is extremely fortunate. We have the same opportunities as those enjoyed by our instructor. We are in a position to get more out of them than is he. While he is placing warning signs at pitfalls and dangerous crossings, he has no more interested on-looker than the farmer. As certain as fate, we are going to use the power he is now developing.

While we are learning our capabilities, we must also learn our limitations. When the pioneering work is over, and all are compelled to recognize that ours is a government of right, not of might, we will file on as much of the newly developed power as may be necessary, not to oppress, but to protect.

[This is one of a series]

Rest

If you were a tree,
After a big crop and long summer,
You would want a rest,
A rest from growth and insects.
Give your trees an early bath with

ZENO

It will kill the various scale,--stop their damage,
Destroy the eggs of red spider and aphids,
Which would later mean millions of insects, and
Destruction to the crop--harm to the tree.

Why 90 Per Cent of Raisin Growers Joined

(By F. A. Seymour at Fruit and Farm Convention, Chicago.)

COULD there be a stronger argument in favor of co-operation? Compare these two pictures—here was a beautiful and fertile valley in the center of a wonderful State producing 70,000 tons of raisins per year at an actual loss to the producers—they were struggling to pay the interest on their mortgages—some were digging out their vines and others were willing to sell out at any price. Now we see the same valley seven years later producing 200,000 tons of raisins, smiling with prosperity, having forgotten the debts and the struggles that went with them and planting new vineyards at the rate of 10,000 acres per year.

The average crop for the five years previous to organization of the California Associated Raisin Co. in 1912 was 70,000 tons, and each year there was a carryover. It was always necessary to sell a portion of the crop to the distilleries, so that it was generally believed that there was an overproduction of raisins and some growers were digging up their vines. Subsequent events have proved that there was not an overproduction and that the fault lay in the method of selling and distribution.

Almost the first act of the Association after organization was the purchase of 25,000 tons of surplus from the 1912 crop, in order to prevent demoralization of the market. These were bought at a cent a pound higher than the packers were offering at that time.

Since that time the entire crop has been sold each year before the following one was harvested, in spite of the fact that the tonnage has increased enormously. The 1918 crop was 163,000 tons and the 1919 crop is estimated at about 175,000 tons. (The estimate of the latter crop earlier in the season was 200,000 tons, since reduced by the extreme heat during the ripening season, and also by the lack of irrigation water.) Our sales of the 1919 crop will amount to about \$40,000,000.

Association Increased Demand for Raisins.

There are two reasons for the increased demand which has taken the greatly increased tonnage—the first is national advertising, which was commenced in 1914, and the second is the fact that the opening price has always been guaranteed against decline until January following, and the trade has learned that the guarantee means something and that they are buying an article stabilized in price and quality—that there is no gamble when their order is placed at the beginning of the season. In 1914, at the beginning of the advertising campaign the sales of bulk seeded Muscats in 25-lb. boxes, which are used almost exclusively by bakers for bread and pies, amounted to 62,573 boxes; the following year they were 583,834; in 1916, 1,050,194; about the same in 1917, and 1,565,938 in 1918.

When advertising was commenced the 2-Crown raisin, which is the one

used in the bulk seeded, was the problem—what could be done with it?—only a limited amount seemed to be required for the carton trade, and the bakers took so little as to make no impression on the balance. The results of the advertising were so definite and immediate that now our problem is to get enough raisins to go around. Planting of new vineyards is going on at a rate which is almost unbelievable.

Nearly \$5,000,000 Operating Equipment.

When the Association commenced operations it was without packing houses and facilities for handling the crop. Contracts were made with independent packers under which they received, packed, stored, and shipped the raisins. They also sold raisins for the Association. A few packing houses were purchased outright and operated by the Association. At the expiration of the first growers' contract, the packing and selling contracts with independent packers also expired and these were not renewed. New and modern packing houses have been built and equipped at points in the valley where required at an expenditure of about \$3,000,000.00.

We have also built a reinforced concrete seeding and drying plant at Fresno, where most of the Muscats for seeding are concentrated. This plant is located on a 20-acre tract in the eastern part of the city. It is served by tracks from both the Southern Pacific and Santa Fe, and is modern in every particular. The up-to-date methods of handling the raisins will result in a saving of two to three dollars per ton on every ton packed. The plant has a capacity of 350 tons of seeded raisins and 150 tons of seedless, a total of 500 tons per day of eight hours. We have an investment in this plant of about \$1,677,000, and are operating throughout the valley 35 packing plants.

These plants have a packing and shipping capacity of 1500 tons per day. We have during the height of the present season been receiving from growers at the rate of 4,500 tons per day, which means the paying out of \$450,000.00 per day. We have paid the growers \$100.00 per ton on delivery this year, though the contract provides for the payment of only \$70.00.

Growers Enthusiastically Renewed Contracts.

A contract was made with growers representing over 75 per cent of the raisin acreage under which they were to cure and deliver their crops to the Association, receiving 3¼¢ per pound for Muscats and 3½¢ for Thompsons at the time of delivery. After the raisins were disposed of the Association was to pay the grower any further sums realized above the initial payment after deducting packing and handling costs, etc. Each year there has been an additional payment varying from \$6.20 per ton on Muscats, which was the lowest, to \$30.00 for the 1917 crop. The 1918 crop figures are not yet available.

The contracts with growers expired with the 1917 crop, so that it was necessary to secure signatures to a new contract. This was done during the winter and spring of 1917-18 in a whirlwind campaign which proved the loyalty and faith in co-operation of the entire valley. Approximately 90 per cent of the entire acreage was signed up on a contract much more binding than the previous one had been. After five years' trial of this method of marketing, a renewal of 90 per cent of a largely increased acreage for another six years seems the strongest possible argument in favor of co-operation from the whole community.

Cut Pruning Costs!

Cut out the wasted minutes! With the high cost of help, wasted minutes mount into wasted dollars—Equip NOW with the

SECURITY LADDER

—the big labor and time saver. Patented steel cuff-bracket machine-wrapped around stile at each step-end, holds the SECURITY Ladder steady—positively cannot wobble—cuts out the endless running up and down ladder to change position. Makes pruning EASIER—plenty of working space on SECURITY Ladders gives pruner comfort and ease. I will ship two or more SECURITYS on approval at these prices: 8-ft., \$5.00; 10-ft., \$6.00; 12-ft., \$7.20; freight prepaid. Pay after you examine and approve shipment. Order NOW!

SELECTION OF MEMORIAL TREES.

To the Editor: Please give information as to whether the Giant Redwood would grow or thrive in the foothills of Yuba county. I wish to plant a memorial tree and would like something hardy and at the same time different from our common trees. Would a silver maple thrive here, or could you suggest any thing better?—Mrs. J. E. C., Smartsville.

(Answered by Dr. Jepson, Univ. of California.)

There could be no better memorial tree used by and for Californians than the Big Tree, *Sequoia gigantea*. It is not only a native tree, but it is, on account of its longevity, especially suited for memorial purposes. It attains to a wonderful age—and not merely a wonderful age, but a lusty and green age with the lengthening of its centuries. It is not too much to say that it may and does outlast nations and races.

It will live in many parts of California outside its natural range, particularly in northern California. It would undoubtedly grow and do well in the Yuba foothills where your correspondent proposes to plant a memorial tree,—that is in a moist or semi-moist situation in the neighborhood of Smartsville or in Penn Valley above Smartsville. It is a clean tree, makes very little litter, and is to the slightest possible degree subject to disease. Each particular age or period of the tree has its own marked charm in a high degree. The Silver Maple is a beautiful friendly tree and could be depended upon to make excellent growth in the Yuba foothills if provided proper soil and given reasonable care for several years. If, however, a maple is desired the native Big-leaf Maple is a hardier tree and grows into individuals of commanding size in favorable situations. It is already adapted to our climate and soils and should be preferred wherever it can be used.

Our native oaks are, many of them, species of unusual beauty. Those of the white oak class are especially attractive, but in one respect are scarcely suited for memorial purposes. When drawing past maturity they tend to drop off or shed suddenly large-sized branches. Trees which are in this way a menace to the living are not desirable as a living monument to the dead.

CITRUS TREES USE DEEP MOISTURE.

(Written for Pacific Rural Press.)

Valencia orange trees ten or eleven years old are three times as big as they were three years ago, as pointed out to us by Geo. M. Cooley of San Bernardino in his orchard. The reason for their remarkable growth is that three years ago he plowed a foot deep. Big roots were broken and pruned smooth. This opened up the subsoil so that water penetrated it. There were no feeders over a foot under the surface. That was because by following ordinary methods of cultivation and irrigation the water did not go deeper than that all summer. A few weeks ago Mr. Cooley dug a hole four feet deep in the center of the square between four trees set 22 feet apart; and at the bottom of the hole he found feeders "thick" and supplying plant food and water to the thrifty trees.

The theory in previous years had been that too much irrigation would bring on gum disease. It did keep the roots in surface soil subject to heat and drying out and periodic disturbance by the cultivator. The object of the deep plowing was to remove these surface roots and enable new growth to penetrate the subsoil. It worked.

Mr. Cooley is one of many who have observed proof that citrus trees go deep into the ground if it is moist. A storm drain through the orchard washed out over twelve feet deep one winter and uncovered grapefruit roots at the bottom because in-drainage had kept the subsoil moist. Another tree was dug out and a root was found which had gone down over twelve feet and had turned back at the dry stratum. Give the citrus trees deep moisture.

MALTHOID and RU-BER-OID READY ROOFINGS

Good Roofing Pays

Sun and rain are the two worst enemies of roofing, particularly the sun because it draws the vitality—the life—right out of ordinary roofing.

That's why good roofing is always cheapest. It has the long-lasting qualities—the ability to resist. You can depend upon it to protect the contents of your home, barn, garage, warehouse or shop for years, and it costs little or nothing for repairs.

Tough, long-fibre rag felt and highly waterproof, sun-resisting, saturative and skillfully combined to make Malthoid and Ru-ber-oid roofings. *Quality* is built in at every step, and every step is supervised by experts of long experience. We have been making Malthoid and Ru-ber-oid for over eighteen years.

It pays to roof with Malthoid and Ru-ber-oid because of their remarkable resistance to the elements, and consequent long life and freedom from repair expense.

Olive Growing and Pruning in California

(By Prof. Frederic T. Bioletti, at Fruit Growers' Convention, Oroville.)

The large crops of fine fruit produced by some olive orchards in California demonstrate the suitability of the climate and soil of some locations for this fruit. Some failures indicate that other locations are less suited.

Olive growing tends to concentrate in the lower foot-hill regions of the Sierras and in similar situations in Southern California, though scattered profitable orchards are found in other localities. The least favorable localities are in the extreme north, in the coast belt subjected to summer fogs, and at elevations above 1500 feet.

With suitable climate, sufficient water, and skillful handling, almost any good soil will yield profitable crops.

The main factors under the control of the grower are (1) choice of variety; (2) application of water; (3) pruning; and (4) fertilization.

The Mission is still the safest variety for most locations; the Manzanillo, Ascolano, and Sevillano coming next in about this order for special localities.

Irrigation is necessary for the best results in practically every locality. Two irrigations, one in spring, and another a few weeks before the fruit commences to ripen, are almost always needed. In the hotter localities and in shallow or leachy soil, one, two, or more supplementary irrigations are necessary.

Young trees should be pruned no more than is absolutely necessary to give them the required shape. The

common method of severe pruning delays the growth and bearing of the tree several years.

Old trees should be pruned every year to preserve their form, to promote an annual growth of fruiting wood, and to allow the sun to penetrate to every part of the tree. This should be done almost entirely by "thinning out" and not by "cutting back." Where trees are too close they do not bear well. Thinning out of the trees is therefore often advisable. It has in some cases been found possible to double the crop by removing half the trees.

Fertilization is useful in some cases but is of little use unless accompanied by proper irrigation and pruning. So far, nitrogenous manures have given the best results. These are farmyard manure, including sheep and chicken manure, tankage, and nitrate of soda. Green manuring, by winter and summer cover crops plowed in, should be practiced whenever possible.

The following general rules for the improvement of olive orchards may be given:

1. Promote vigorous growth by good cultivation, sufficient irrigation, and where needed by green manuring and nitrogenous fertilizers.

2. Prune bearing trees regularly every year to promote a moderate growth of new fruit wood, to open up all parts of the trees to the sun and to preserve its form.

3. Prune young trees as little as possible while developing the desired form.

Seed Potato Association Formed

(Written for Pacific Rural Press.)

The California Certified Seed Potato Growers' Association was recently organized as the outgrowth of a potato growers' observation trip under auspices of the Los Angeles County Farm Bureau. A Potato Growers' Section in the local Farm Bureau was also organized. We quote from a report of the trip written for Pacific Rural Press by Manager R. G. Risser of the Crop Production Department of the California Vegetable Union:

"Many interesting observations were made on this trip, one of the most striking facts brought out being the superior yielding quality of the British Queen and its exceptional adaptability to the more fertile soils. The fact that this potato has such a large number of tubers on each hill, however, renders the size of the tubers undesirable unless the soil is sufficiently productive to properly develop them. The susceptibility of the White Rose variety to such diseases as Mosaic and Curly Dwarf was also very apparent and growers determined to rogue out the affected hills in order

to secure healthy seed. The question of holding potatoes over in cold storage was discussed and bad results from low temperatures were very evident.

Perhaps the most sensational point brought out was the demonstration of a method of telling how many potatoes each hill contained by an examination of the vine. Mr. Young of Huntington Beach showed that he could correctly state how many tubers each hill contained without digging the potatoes. This was done by counting the lower branches on each plant. The number of potatoes was found to correspond very closely to the number of branches.

HORTICULTURAL JOTTINGS.

J. E. Carlson is planning to set out a pear orchard on the flat land near Novato, Marin county.

Raisin yields seem to have been a little less than a ton per acre, total production being close to 180,000 tons from an acreage 5 per cent greater than last year.

Over 30 carloads of winegrapes were shipped to Reno and Sparks, Nevada, this season. They were made into wine and the wine makers are now in trouble.

Pear tonnage shipped is less than last year, but a greater tonnage was dried and canned. The total crop is about 110,000 tons, about 10 per cent greater than in 1918.

About 4,000,000 boxes of apples will have been packed this year in California. This is slightly less than 60 per cent of the total crop, according to the U. S. Bureau of Crop Estimates.

The last crop of prunes sold to an independent packer by Dr. F. M. Coleman of Santa Clara Valley were carefully tested by himself. He counted 55 per pound, but the packer counted 59 per pound. This made \$60 clear money for the packer if Mr. Coleman's count was correct.

The first commercial planting of figs in the rolling hill land along the Tuolumne river is being made by Geo. K. Beard near La Grange. Fourteen acres of Calimyrnas with sufficient capris have been set out; and he is preparing to increase the planting to 100 acres, using almonds on the steeper slopes. This orchard lies in the extreme upper end of the Waterford Irrigation district.

Stump Land Worth Money To Day

This one-armed man Pulls big trees by hand

FRANK M. HANCE, a one-armed farmer of Bowie, Md., sent me this photo of himself and a "K" pulling a double silver maple, 3 ft. 8 in. in diameter at the ground. What he has done you can do. Clear your stump land cheaply—no digging, no expense for teams or powder. Your own right arm on the lever of the "K" Stump Puller can rip out any stump that can be pulled with the best inch steel cable. I guarantee it. I refer you to U. S. Government officials. I give highest banking references.

HAND POWER. K Stump Puller

ANY red-blooded man with a "K" can outpull 16 horses. Works by leverage—same principle as a jack. 100 lb. pull on the lever gives a 48 ton pull on the stump. Made of best steel—guaranteed against breakage. Has two speeds—60 ft. per minute for hauling in cable or for small stumps—slow speed for heavy pulls. Works equally well on hillsides or marshes where horses cannot go.

IMPORTANT To one man in each locality I will make a special money saving offer. Write for it today.

California Honey Producers' Exchange

(Written for Pacific Rural Press by J. D. Bixby.)

The California Honey Producers' Co-operative Exchange is glad to have this opportunity to become better acquainted with the Pacific Rural Press family of readers. She is the little sister to the other large and prosperous co-operative marketing associations of the State.

While our Exchange is only a little over a year old, it has grown to such an extent that it now represents nearly 1000 beekeepers, controlling 100,000 colonies of bees and the marketing of 80 per cent of the honey produced in California.

The beekeepers of Arizona have heard the call and are forming two of their own locals, one at Phoenix and one at Yuma, with their surrounding territory, to affiliate with us.

To Sell 125 Carloads of Honey.

While it has been a poor season for the beekeepers owing to the short crop, the success of their Exchange in disposing of honey at good prices will help them carry their part of the high cost of living. It now appears that the Exchange will sell 125 carloads of 36,000 pounds each this season at the value of \$820,000.

Botany for Beekeepers.

A working knowledge of botany is an important factor in the successful honey producer's equipment. He should be able to recognize the leading nectar producing plants of any given locality and know enough of their blossoming habits to be able to adjust his plans to them. I have known a beekeeper to spend days of time and many dollars sowing high-priced sweet clover seed over dry sage hills and sand-washes, ignorant of the fact that sweet clover will thrive best only where there is abundant and permanent moisture. Some have located apiaries in a wilderness of so-called sage brush which was nothing but artemisia or "old man," a species of wormwood which secretes no nectar whatever. Several beekeepers finding the "large Lima" bean fields unprofitable this year on account of the severe drouth and lack of ocean fogs, moved their bees to the "baby lima" irrigated fields of the San Fernando Valley, but few of them profited as they arrived too late. Beans yield mainly during the first two weeks of the bloom. Of course, the variation in the time of planting prolongs the nectar season somewhat. One enthusiastic beekeeper with the P. H. D. and B. S. after his name, asked me seriously if the proximity of an orange grove was an injury to bees. Surely the school-master was abroad in his case. The more knowledge the beekeeper has along these lines the more he will enjoy his work and the more successful his work will be.

Lying in Wait.

One of the independent brokers who is an extensive handler of honey as well as other products, sends out a circular to its eastern customers calling attention to the fact that without exception their opening prices this year have been materially lower than those later named by the different co-operative associations. This means that a lot of producers—maybe not you, but many other fellows—have been caught by contracts and forced to sell their honey way below the price the Exchange could have gotten them for it. The brokers call attention to this with considerable pride to these low figures but carefully avoid mentioning how they "skinned" the producers.

Transient Bees Threaten Local Industry.

The local beekeepers in the orange district are very much alarmed at the increased importation of bees into these districts from outside States, that are shipped here merely to take advantage of the orange flow, then shipped back to gather the later honey flow in their own States. Beekeepers are finding that where the ranges are so overcrowded it is practically impossible to keep down bee diseases, as infection spreads rapidly from one apiary to another, and unless some-

thing is done to remedy this a great many beekeepers are going to become disheartened and go out of business. Not only do the bees that are shipped in from other states add to the spreading of bee diseases, but there is also considerable danger of other infectious diseases being brought into the State by these shipments. A great many of the bees are brought in from Utah where the alfalfa weevil is so strongly entrenched. It is claimed that these weevils hibernate in the bottom of bee-hives and can be very readily packed from one district to the other. If this weevil ever gets a good hold in our alfalfa fields here it will be a terrible calamity for our alfalfa growers. It is time they woke up to this danger and investigated before it is too late. Our dairymen also ought to be vitally interested, inasmuch as they depend upon alfalfa for their principal forage crop. It is highly desirable that the beekeepers should act in a generous spirit towards their fellow beekeepers in other States, still the time has come when the most generous and unselfish of the beekeepers of this State realize that unless something is done to remedy the situation, a great many beekeepers are going to be driven into other lines of work. They believe the time has come when the State will have to take up this problem and solve it.

Honey Crop Mostly Sold.

All the comb honey in the State of California has left the producers' hands and is now in the hands of the retailers and wholesalers for distribution. The California Honey Producers' Co-operative Exchange has only one car left, which is now in Philadelphia being offered for sale. Owing to the shortage of sugar there has been strong demand for all the lower-grade honeys, so that the Exchange has been able to move this grade of honey very rapidly at good prices, so that now there are only two or three cars remaining unsold. Even the honey with 80 per cent honeydew was sold for 12 to 13½c per pound. The Exchange has only one car of amber honey left which we believe will be sold before this article goes to press.

Sugar for Bees Much Needed.

As everyone knows who is connected with the honey industry, the crop in the State of California was not even one-half of normal. In a great many districts there was practically no crop at all. In such places

the shortage of sugar is threatening the loss of thousands of colonies of bees inasmuch as sugar cannot be obtained for feeding purposes. Application has been made to the Sugar Equalization Board through Dr. Phillips, who have referred the beekeepers to the refineries. Up to date the refineries have not been willing to give the beekeepers any satisfaction, merely referring them to their brokers. It is possible that before another week some sugar can be obtained, but not in any quantity sufficient for their needs. Sugar brokers state that after the first of the year sugar will be more plentiful. All beekeepers who can get along until then may feel rea-

sonably safe unless they are in a locality where it is impossible to feed at that time owing to the low temperature. Beekeepers should strive in every way to meet this situation and pull their bees through, inasmuch as the outlook for good prices for their honey in future years looks very bright.

Cans for Next Honey Crop.

The Exchange is now receiving sample cans to pack their honey in next year, and suggestions for improvements are being carried out. Those who are interested in the honey industry will be very much elated over the packages next season.

How Weeds Are Spread.

Of the many ways new weeds are introduced and spread into new territories, water is perhaps one of the largest disseminators in California. Johnson grass, Bermuda grass and Crab grass were unknown in some of our most fertile sections till irrigation was introduced from large waterways, where now they are a constant menace and source of expense. Imperial Valley has reduced the fight to a science. Canada thistles were unknown in Humboldt County till they were introduced in hay imported by the lumber camps. The mighty rivers have carried the seed down and spread it out over the bottoms and it has to be fought. On the J. Hoffman place at Holmes, there was a patch about half the size of a town lot 15 years ago. It has now spread over his whole 40 acres and beyond, according to Frank Essig. Weeds are like fire, unless they are controlled at the start, the battle against them is a costly undertaking. The Canada thistle, morning glory, Bermuda grass and Johnson grass are bad actors.

Clear Lake Will Not Be Spoilt.

The large pumping plant of the Yolo Water and Power Company, installed at Clear Lake (Lake County) last year at the instance of the United States Food Administration, is to be dismantled forthwith and sold. Clear Lake is the chief feature of Lake County and one of her largest assets. She has strenuously objected to its destruction to add values to a neighboring county, and litigation was pending to preclude further encroachment by the Water Company. Clear Lake has all the charm of the Swiss lakes, and the county considers it has a future for tourists that will grow rapidly with the completion of the State highway. The rim land is exceedingly productive, the Lady Washington beans from Upper Lake being sent all over the country. Some of the best pear orchards in the county—famous for its special dried pears—are on the borders of this lake.

Bunyip Wheat Proved Desirable.

Nearly 3,000 acres of Bunyip wheat in San Joaquin county averaged 13 or 14 sacks per acre this year. This is one of the Australian wheats of which the Sperry Flour Co. secured 100 pounds from the Australian exhibit at the Panama-Pacific. This was planted and increased until in

the fall of 1918 about 100 tons were distributed for seed. Bunyip looks a bit like Bluestem. It has a stiff straw that did not break badly while standing 50 days after it ripened, and did not shell out badly. It is less hardy than Baart and does not stool so much.

Early Planted Grain Best.

One of the oldest of the grain growers in Salinas Valley is H. G. Hansen. One of the Salinas dealers had told us that his grain hay was about the best that had been brought to town. But we found that Mr. Hansen makes hay only when he is pretty sure he can't make grain. It was a question last spring, after two dry years, but his barley made eleven sacks per acre average for the entire 400 acres. "I have always had the best crop when I planted in December or earlier," says Mr. Hansen. "We plant as soon as possible after the first rain and the earliest planted is the best, other things being equal." His soil is of granite origin, still containing fine granite particles in the loamy upland.

Airplanes to Shoo the Ducks Away.

You can generally get an airplane ride at ten to twenty dollars an hour, but it is supposed that the airplanes reported to be saving some rice fields from wild ducks do not cost so much. Otherwise it might be cheaper to lose the rice, especially since the fliers of both kinds seem to be getting accustomed to each other. Probably a more effective way is that indicated by the thousands of ducks which are given automobile rides these days. If they could be given such a ride earlier in the season there would be fewer brainstorms in the minds of sensation-seeking newspaper writers.

Forcing a Fair Price for Cotton.

In order to force a rise in the price of cotton sufficient to offset the sharp advance in the costs of production, the cotton growers of the country, through their organization, the American Cotton Association, propose to retire temporarily 2,000,000 bales from the market. The plan adopted is to call on the membership of each state to transfer voluntarily to designated banks, warehouse receipts for specified amounts of cotton, to be held in trust until such time as the association decides that prices justify the cotton being placed on the market.

Oriental Bean Imports and Exports.

Imports of dry beans for 18 months—January, 1918, to June, 1919, inclusive—were 6,830,982 bushels, according to the U. S. Bureau of Markets. Of these, 2,050,186 were re-exported. Since last December, re-export movement has been more active, amounting to nearly one-half of the imports. In addition to the re-exports, American beans were exported during the 18 months amounting to 5,528,061 bushels, of which fully four-fifths were exported during the twelve months ending July.

Vegetable Association President.

Members of the California Tomato Growers' Association will note that L. B. Taylor of Burbank is president of the Vegetable Growers of California, Inc., which is seeking to supersede the former Association. Mr. Taylor is one of the largest vegetable growers of the San Fernando Valley in Los Angeles county, being reputed to have over 600 acres of his own besides what he manages for other people. C. A. Proudfit of Ripon is the vice-president.

New \$5,000,000 Vegetable Marketer.

Big interests seem to be coveting the vegetable marketing business of Southern California. The International Marketing Company of Los Angeles has recently been authorized to sell \$5,000,000 capital stock for this purpose.

A \$3,000,000 advertising campaign to develop American markets for California rice is reported to be contemplated by the millers and the California Rice Growers' Association.

We Manufacture Levelers for Any Power from 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler

WILL WORK WONDERS ON YOUR FARM

Moving immense amounts of dirt daily, and working on ground too tough for horses and Fresnoes to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners' time, labor and money.

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

A GREAT ROAD MACHINE

Every road district should own one of these machines for constructing roads. They will cut down the high places and make fills quicker and cheaper than by any other known method.

YOU SHOULD

send for our latest catalog, J-600, which is full of interesting information on Labor Saving Devices and machines for moving the earth.

WHY DO THE BIG PACKERS MAKE SO MANY MILLIONS?

THE ANSWER IS:

They KNOW, they don't guess, and they don't speculate. Their volume is enormous: they KNOW THEIR MARKET; they KNOW their PRODUCT; they KNOW their BUYERS; they KNOW their BUSINESS—THEY ARE ORGANIZED.

Alfalfa and Corn are two great California crops worth many millions every year. Great losses have been made by producers and corresponding profits made by speculators from the California crops.

WHY DON'T THE PRODUCERS ORGANIZE? THEY HAVE.

More than 1500 producers are members of
ALFALFA GROWERS OF CALIFORNIA, INC.

a non-profit, co-operative and State-wide association. If you grow alfalfa or corn, join that Association.

Write for information to

ALFALFA GROWERS OF CALIFORNIA, INC.

Fresno Lancaster El Centro

This Folder Tells You How To Make Your Idle Land Earn Money

This is the day and age when you should make every foot of land produce profits for you. If you have any size tract ranging from 80 to 5,000 acres in the Western States that need development you should send for this book at once. It tells you the way to develop your property through the use of Hydro-Electric plants, gravity irrigation systems, pumping plants, grading, and buildings; in fact, it points out the various essentials that are necessary to make your ranch a producing property.

Now 's the time to act, so that you can get a crop from your land next year. It is a certainty that crops will bring good prices next year, so take advantage of this condition and get your land under cultivation now.

Write today, stating location of land and number of acres.

RHUBARB WAGNERS -
PLANT NOW IMPROVED
Growers making \$1000 and over per acre annually. Splendid results in six months. Special prices for immediate planting. Also berries and small fruit, etc. Write to the originator, J. B. WAGNER, Rhubarb and Berry Specialist, Pasadena, Calif.

SUGAR-BEET SEED SCARCE.

There will not be enough sugar-beet seed in the world to plant a normal crop for the 1921 harvest unless a great many people shall be induced to save beet roots this fall to plant for a seed crop in 1920. This information comes from the U. S. Department of Agriculture after a survey of this country and Europe, through representatives of sugar companies, seed dealers, and Department sources of information.

It seems that there will be enough sugar beet seed for 1920 planting; but the situation for 1921 is serious: (1) because of limited seed production in Europe as compared with former years; (2) because of increased seed planting in Europe for sugar; (3) because of increased acreage planted to beets in this country in recent years. Beet-sugar production in the U. S. has gained rapidly on cane-sugar during the past 20 years, and permanently exceeded it in 1906-7, so that it has been about 2 3/4 times the cane-sugar crop during the past six years.

It is probable that several years will elapse before normal quantities of sugar-beet seed will be produced in European countries. American growers will have to depend still more on home-grown seed than heretofore.

American Seed Production Increasing.

Home-grown sugar-beet seed production has jumped from practically nothing before the war to 6,384,000 pounds in 1918. The 1918 crop was grown on 6,000 acres. Ten thousand acres were planted for seed in 1919, but drought prevented a proportionate increase in crop. Cultural details are contained in a bulletin issued by the Bureau of Plant Industry, Washington, D. C.

Practically all of the sugar-beet seed produced in California is that from 450 to 500 acres planted by the Spreckels Sugar Co. This yields about 900 pounds per acre of seed. Small beets produced in the fall are transplanted during the winter to bear seed the following summer.

SOUTHERN CALIFORNIA TRUCK CROP NOTES.

From reports of E. W. Stillwell to the U. S. Bureau of Crop Estimates (November 4), we glean the following notes: Cabbage acreage will be largely increased, especially in Los Angeles, Orange, and Imperial counties. The former two will have probably 2,000 acres each, though planting was not complete. Most of the acreage is Winningstadt. Some Cannon Ball will be planted. Cauliflower acreage is estimated at 4,200 as against 3,450 in 1918 and 4,800 in 1917. Growing conditions have been favorable. Snowball comprises the bulk of shipments, but Early Pearl is about matured. Shipments are expected to increase until the last of January. The first car of celery from Southern California was expected to leave El Monte within a few days. Lettuce from Los Angeles County is improving in quality, but still contains considerable loose and leafy stock. Growing conditions favorable. Previous estimate of 9,000 acres in Imperial Valley rather high. Spinach shipments from about 1,500 acres in Imperial Valley are expected to begin about Christmas, though some plantings are later on account of Texas competition. A few hundred acres are planted in Coachella Valley. Tomato shipments from Southern California are likely to decrease rapidly from now on. Low spots in San Fernando Valley, El Monte, and Orange County districts have been frosted slightly.

Green Lake county has completed its fourth cow testing association and begun work on a fifth, reports the county agent. The cow testing work in the county agent exhibit at the local fair was planned to boost interest in testing.

"Every cow in Rusk a tested cow" is the county agent's slogan in that community. Sixteen farmers brought 150 samples of milk to his office in the month of July, and 17 farm visits were made for testing milk. Two meetings were held to boost the project.

P&O Walking Gang Plow, with Riding Attachment

The Hillside Farmer and his Plowing Problems

HERE are two plows, entirely different from each other in construction, both of which have made good on hillsides and slopes in various sections of the country.

The P&O Walking Gang is a big, heavy plow, made in two-, three- and four-furrow sizes, with a wide wheel-tread preventing it from tipping over or losing the line of draft on hillsides. It is strong enough to withstand the strain and pull of all the horses that may be hitched to it. The plow will hold—the farmer's worry is, "will the harness stand the strain?" The two- and three-furrow sizes can be increased one furrow in capacity by the addition of an extra bottom, and the four-furrow can be reduced to a three-furrow by the removal of one bottom. This enables a farmer to regulate the size of his plow to meet his own local plowing conditions.

The P&O Two-Way Success Sulky has two bottoms, one right- and one left-hand, one being raised while the other is in the ground. The hitch is adjustable for two or three horses. In using this plow the furrows are all turned one way—down the hill—as the team travels back and forth, one furrow being turned right-hand and the other left-hand. This plow turns around like a racing sulky, and it can be backed up into corners. To say that it is a "P&O" is as good as saying that it is simple and strong; built right.

Call on the International dealer and let him tell more about these plows—the kind that minimize the labor of turning furrows on slopes and hillsides.

The Pacific Rice Growers' Association

(Read at Chico Fruit and Farm Convention by J. H. Stephens, President.)

The Pacific Rice Growers' Association is one of several of our co-operative, non-profit ranchers' organizations, and the entire State of California is its field.

Organized in 1915 as a distinctly marketing organization, it has rapidly broadened its sphere, so that today its activities are not confined to the annual marketing of the crop, but extend to matters of education and legislation having in view the advancement and protection of the industry as a whole.

Annual Memberships Include Majority.

How satisfactorily it fills its field may be judged from the fact that every succeeding year, despite the tremendous increase in acreage, it controls by far the greater portion of the product of the rice fields of the State. This is particularly significant when it is understood that at the close of every season we are left without membership and must begin anew the canvass for members. The orchardist or the vineyardist has a fixed planting which produces, through the years. Not so with the rice grower. Be he owner or tenant, he cannot plant his field to rice for more than three consecutive years. He may grow rice next year, and he may not. It is due to this circumstance that we have no long-term agreements of membership, nearly all of them being for only one year. It will thus be seen that among the rice growers, the benefits to be derived from organization are very generally recognized.

Our Association is now in its fifth year. It was originally conceived in a small way as a marketing organization, but reorganization on broader lines was effected in 1916 under the direction of those who are now actively in charge of its affairs. At this juncture I desire, in behalf of the directorate of our organization, to make public acknowledgment of the invaluable service rendered by Hon. Harris Weinstock, State Market Director, at that time. His sound judgment and wise counsel during the days of reconstruction and readjustment are largely responsible for the creation and continued existence of a State-wide organization of admitted force and influence.

We have nearly 500 members this year. In point of numbers, this is not impressive, but when it is considered that many of our members grow rice in tracts of 1000 and 2000 acres, and that a planting of a quarter-section of land to rice is regarded as small, it will be seen we are a pretty healthful organization.

Representation on our directorate is based upon acreage by counties, and under this plan all rice-growing districts, through their directors, have a voice in the management of the Association's affairs. Coupled with this, we encourage the county unit plan, experience having shown that home organizations are capable of dealing with distinctly local problems, leaving the central organization to take care of the greater things.

Farmers Need Market Information.

One of the principal reasons for the necessity of such an organization is the fact that the farmer has no means of knowing actual market conditions. His time is taken up with the harvesting of his crop and getting it to cover. Market prices are constantly fluctuating, and by the very nature of things he cannot follow them, much less anticipate them. A strong marketing organization is his only protection.

It is true there are some growers who do not belong. Some are opposed to co-operative marketing. Others belong to the class which is always willing to ride, but is averse to paying the fare. Every industry has these two classes to contend against, but happily they are in the minority.

Rapid Growth of Rice Industry.

Digressing for a moment to point out the present-day importance of the rice industry in California, and to show the rapid advance it has made, it may be stated that in 1914 the commercial development of rice was first reached, when 16,000 acres, yielding

480,000 bags of 100 pounds each, were planted. Since then the plantings and their yields run thus:

1915	32,000 acres	960,000 bags
1916	64,000 acres	1,920,000 bags
1917	84,000 acres	2,520,000 bags
1918	110,000 acres	3,300,000 bags
1919	140,000 acres	3,500,000 bags

(Estimated)

The value of the 1914 crop was a little more than \$800,000, while the estimated value of the 1919 crop is between \$21,000,000 and \$23,000,000.

A falling off in the estimated yield for 1919 will be noted. I regret to say that the shortage this year will range from 700,000 to 1,000,000 bags. The former figure is used here in an endeavor to be conservative. The shortage is due to the fact that this year we planted a great deal of third-year land and considerable areas of fourth-year land. Added to this was an extended period of extremely cool weather early in the growing season, just at a time when the rice needed warm weather for its advancement, and it failed to develop as it should have developed. In many instances newly-planted lands failed to produce as expected, and all things combined, we are short of our estimated production.

Members' Crops Separately Sold.

Contrary to the general impression, we do not pool the Association's holding, the individual member holding the right to confirm or reject any offers made through the Association. However, he is not permitted to sell direct to the buyer or through any other agency. If he does he is subject to a heavy penalty. Thus, we are enabled to protect the market at all times.

Foreign Rice Crop Information.

We have four branch offices in the principal rice centers, and have a far-reaching service system by which we are kept informed of crop conditions in the great rice belt of the Southern States and in many of the rice-producing countries of the Orient. During the marketing season we are in receipt daily of reports of market conditions at home and abroad.

How Growers' Rice Is Sold.

For the protection of our members we have a large force of experienced and highly trained rice men—experts, they may well be termed. These men sample all rices and forward them to the main office in Sacramento, where they are placed on our tables for the inspection of the buyers, duplicate samples being retained in the branch offices of the respective districts.

When buyers make a bid it is referred to the owner of the rice for acceptance or rejection. At the time of such reference we are in a position, by reason of our close touch with market conditions, to advise the owner whether the bid meets the market price of that particular grade and quality. If the owner accepts, the rice is ordered out for shipment under the direction of our traffic bureau.

The next stage is the grading out by the buyer or his representative. All rices which in the judgment of the buyer do not come up to sample are temporarily treated as rejections, to be passed upon later by our representative. It often happens that rices set aside as noted are not rejections and our representative sees to it that the buyer takes them with the main lot. All rices are loaded into the cars for shipment as they are graded out at the warehouse and draft in favor of the Association to the account of the owner, is issued before the shipment is permitted to move.

We charge a commission fee of 5 cents per hundred pounds for our services, and what money is left at the end of the season, after paying all operating expenses, is returned to our members in the form of a rebate.

This briefly outlines our methods of operation. Much in the way of detail could be given in this connection, but is deemed needless for the purpose of this paper.

It will be seen from the foregoing that we do not make the market. Our province is to protect our members and see they get the full market value

for their product, whatever it may be.

That I am a firm believer in co-operative marketing goes without saying. It is the only agency through which the producer is enabled to produce at a profit. Its power to effect this end has been most thoroughly demonstrated. However, in this, as in all other things, the unwise exercise of power can only result in harm and injury to the cause of co-operative marketing.

It is America's job to contribute largely to the world's food supply for the next two years. This implies big prices, based upon demand. However, we must bear two important facts constantly in mind: First, there comes

a time in the commercial history of any product when its price can be brought to such a high level that the consumer will turn from it and take to something else as a substitute. Second, the consumer cannot consume tomorrow that which he should have consumed today.

Alfalfa Seed Scarce in U. S.

(Written for Pacific Rural Press.)

The United States Crop report on alfalfa seed indicates that the 1919 crop is far below normal.

Causes of Short Crop.

The comparatively low price of alfalfa seed during the last few years discouraged many alfalfa seed growers.

Many old alfalfa seed fields were plowed up to increase wheat acreage in the middle west and cotton acreage in Arizona.

Because of the high price of hay, many of the fields that are usually left for seed were this year cut for hay.

In Kansas and Nebraska, the wet weather during early summer made it impracticable to let the second crop of alfalfa go to seed as usual; and the few who tried growing seed from the third crop, suffered heavy losses from grasshoppers and army worms.

Just before alfalfa seed harvest, the crop was estimated by the U. S. seed reporting bureau at 66 per cent or normal; but as hulling progressed, the yield was found to be considerably less than the estimates before harvest.

California's Production.

During the season of 1918 California produced about 800 tons of alfalfa seed. Of this amount about 175 tons were shipped from California to Eastern states, and about 500 tons were shipped into California from Arizona and Utah, indicating that about 1125 tons of alfalfa seed were sown in California during winter of 1918 and spring of 1919.

A careful survey of this season's alfalfa seed crop shows the total

amount of alfalfa seed harvested in California to be not over 600 tons, of which 200 tons has already been contracted for by eastern dealers, who are also very short of alfalfa seed.

The estimated amount of Arizona alfalfa seed available for California use is not over 200 tons, which added to the California seed available amounts to 600 tons or about 40 per cent as much as was sown last season.

The eastern states seem to be even shorter of alfalfa seed than California is and the eastern dealers are trying hard to purchase California and Arizona seed for their use.

Importations.

There has been some alfalfa seed imported from Italy and Spain, of which at least one carload has reached California, but this imported stock is not as desirable as our domestic seed, first because it is old seed, and the strains are not adapted to our soils and climates, and because most of it contains considerable buck-horn and other weed seeds.

Alfalfa seed is still the lowest in price of all the clovers, being about ten cents per pound lower than red clover and Alsike, and there is every indication that if the seed were available a normal acreage would be seeded to alfalfa this season; but as the quantity of seed available is very limited, it will be not as much a question of price as a question of getting any seed at all. Those who expect to use alfalfa seed this season will do well to make sure of their supply of seed before preparing their land for seeding.

United States Potato Crop Short

Commercial late-potato production in every commercial potato State but one is less than that of last year, according to the November report of the U. S. Bureau of Crop Estimates. The total estimated shipments in carload lots are 131,804 for 1919, which is 20,434 carloads less than last year in the seventeen States for which figures are important. Total U. S. production is 348,000,000 bushels as compared with 400,000,000 bushels last year.

About 60 per cent of the California commercial production is made up of late potatoes moving after September 1. This year our shipments after September 1 promise to be 5,260 cars as compared with 6,200 last year, 4,590 in 1917, and 4,500 in 1916. The Delta region produced this year about 95 per cent of our late commercial potatoes. The figures given below show that eight States excel us in potato production this year.

Estimated Carloads Potato Shipments.

State	1919	1918
Maine	25,750	26,922
New York	9,900	10,650
Pennsylvania	6,980	5,950
Michigan	9,828	12,000
Wisconsin	21,300	25,510
Minnesota	24,500	26,000
Iowa	513	950
North Dakota	2,035	2,950
Nebraska	2,574	5,000
Montana	516	946
Colorado	10,000	14,800
Utah	340	465
Nevada	585	700
Idaho	6,830	7,725
Washington	2,800	3,130
Oregon	2,093	2,350
California	5,260	6,200
Total	131,804	152,248

The total production this year in California is estimated at 11,350,000 bushels. The yield per acre fell from an average of 135 bushels last year to 129 this season as estimated. About 80 per cent of the 1919 California potato acreage was grown for market.

AGRICULTURAL NOTES.

The Chevalier barley crop in Salinas Valley was way below normal.

Corn yields in California seem to average about 33 bushels as against 35 last year.

National Master Wilson says: "I see no benefit to be obtained for the Grange by affiliating with the A. F. L."

Sugar beet yields averaged about 7.3 tons per acre this year. The average for nine years past has been about 9.55 tons.

Oakdale rice growers are benefited by rains holding off during harvest, no rice being lost this year because of too much moisture.

The railroad administration told Senator Phelan that more refrigerators were being sent to California to handle the citrus crop.

Of the 290,000 acres of beans other than limas planted in the State, about 95 per cent were harvested, yielding 2,262,000 centals. Limas add 540,000 centals to this figure.

Sweet potato yields are estimated at 133 bushels per acre this year as against 170 last year in reports of the U. S. Bureau of Crop Estimates. Total production will be about 1,000,000 bushels.

The American Farm Bureau Federation, whose convention in Chicago closed November 14, adopted resolutions opposing Government control of public utilities, urging immediate return of the railroads to their owners, and opposing free distribution of seeds.

The future of hops is really up against it. This is the conclusion of E. Clemens-Horst Co., which is probably the greatest hop-producing outfit in America. The Horst Co. has announced that they intend to uproot all their hop vines near Wheatland and plant other crops. Other hop growers in the Wheatland district are doing the same thing.

AT LAST—IT'S HERE A GREAT LEVERLESS TRACTOR DISC

With an

**AUTOMATIC
ADJUSTABLE HITCH**

It offers more advanced ideas of construction than were ever before presented. You can get a disc now without levers sticking upon it to break off tree limbs or to break your back "throwing her out" of the ground.

The best "Leverless" Automatic Disc Ever Invented.

WE HAVE READY FOR DISTRIBUTION A NEW TRACTOR DISC WITH THE BEST AUTOMATIC FEATURES EVER INVENTED.

The angle of the disc is given by pulling a rope attached to a trip lever on the disc and brought forward to the tractor driver's seat. To change from straight to working angle, all that is necessary is to pull the rope attached to the trip lever which sets the disc to any angle desired.

Besides the automatic features which give this disc an advantage everyone desires, the automatic is one of the heaviest and strongest ever constructed, having braces and cross braces of steel angle irons. This is not a trailer type harrow. It is absolutely impossible for the rear gang to trail the furrows made by the front gang. The frame is rigid. The disc cuts down ridges, fills up holes and levels the ground. Every feature of the construction is for utility and hard service. Made for tractors in 5, 6, 7, 8, 9, and 10 ft. sizes, with either 18 or 20 inch cutaway or solid discs. Farmers who expect to buy disc soon, should be sure to see this new automatic disc with its many improved features. All sizes on display at the Salesrooms of

Reducing Tractor Upkeep Cost 50 per Cent

(Written for Pacific Rural Press by D. J. Whitney.)

One of the worst things about a tractor is the upkeep—repairing or replacing worn parts. The greatest cause for wear, according to a San Joaquin Valley fruit grower, who has used eight tractors and is still using the first one he bought in 1915, is the overloading of the motor.

Now overloading in this case does not mean running an engine beyond its rated working horsepower, but running it steadily close to the limit of its capacity—to the capacity that manufacturers expect the motor to run. If the machines were run that way only for short periods it would be different. That would be like automobile operation, where natural running conditions are far below engine capacity and the engine is worked close to the limit of its power only occasionally, and then only for short periods as a rule. For this reason an automobile engine ought to be good for many years with very little doctoring. If it were run up to the limit of its power whenever it was used, it would go to pieces in short order, but that is the way most tractors are run and are supposed to be run. Their stronger construction helps some, but does not do everything.

What is needed therefore is to leave every other part of the tractor just as it is, but to install an engine with surplus horse power, which will not be used. If, for example, the bore is now four inches, make it five inches. The consequence? No more power could be used than is used at present, for every attempt to speed up the engine and to apply more power would simply result in having the wheels spin.

Use Lugs Judiciously.

The lugs should not be too large or the wheels would not spin. They should be made of such a size that the effect of every attempt to work the engine to capacity of the transmission or other parts would be to have the wheels lose their grip on the ground.

The grousers are supposed to be designed as a rule to fit the power of the engine. Without being too large, they are, in normal soils and with normal loads, supposed to give what traction is needed. In common practice, however, salesmen talk engine all they can and there are few makes of tractors for which many agents will not boast that the motor can spin the wheels. In light soils, or where the footing is not quite up to standard, most of them can do so.

Prevent Use of Surplus Power.

It will, of course, be clear that with an overly powerful engine for the rest of the tractor some method would have to be adopted to prevent the surplus power from being applied, so as not to pull the rest of the tractor to pieces. A positive limit to the opening of the throttle, or some other device could be used, no matter how much traction the wheels would take.

The result of such a method would be that the motor under normal working conditions would, and could, never run much beyond say 60 per cent of its actual capacity, which would be the amount that the rest of the tractor was designed for, whereas now, the motor is more likely to run steadily at about 90 per cent of its capacity when used with many tools and on most grounds. Self-evidently the wear on the engine working at 60 per cent would be only a small fraction of the wear on an engine running most of the time close to the limit. This rancher figures that his plan would cut down the upkeep cost of the average round wheel orchard tractor fully fifty per cent. The manufacturing cost and buyer's price would naturally be slightly larger with a large engine than with a small one; but this difference would so quickly be overcome in the saving in wear and tear, that a tractor like that would be cheaper by

the end of a year than a similar tractor with a smaller engine.

Provided the engine was designed so that full power could NOT be applied, not a single other part of the tractor need be a particle larger than before, except to enable it to hold up a few pounds weight more, so the making of a larger engine would be the only extra expense. A great addition to the horsepower need add only a couple of hundred pounds to the weight.

The fuel consumption of the larger engine would be practically no more than that of the smaller engine. You say, "Well, does not an engine with a five-inch bore use more fuel than one with a four-inch bore?"

Yes, provided both are run to the same per cent of capacity, but if the smaller engine is run at full capacity and the other at much less than capacity—to the same horse power as the smaller engine—the fuel consumption should be so nearly alike that any difference would never be noticed. The fuel used is measured by the power applied, not by the size of the engine. Consequently the only effect of a larger engine, adjusted so that no more power could be used than present engines commonly use, would be to add a few extra pounds to the total weight of the tractor. There would be no noticeably greater operating cost, but you would have a motor working well within its limit instead of close to its limit, and the upkeep would be so much less that the tractors would be even better bargains than they are now.

Statements Based on Experience.

The first tractor secured by the rancher who makes this point is still working and giving excellent satisfaction. But the engine was taken out and a stronger engine put in. This is a direct application of the theory suggested, and the application has proved a great success.

We asked him if his troubles were not mostly due to speeding up the engine and jerking in hard spots. He replied that such troubles would show up mostly in the transmission system—but such troubles are practically absent. It is the engine parts that wear out on his tractors. The crankshaft and connecting-rod bearings have to be refitted frequently. New wrist-pins and new bushings have to be put in. The piston grooves have to be turned out and new rings fitted.

"After four seasons' experience with tractors, I am satisfied that we will not get a tractor that will perform satisfactorily until the manufacturers put in an engine with as much reserve power as the best automobiles have. Our tractor troubles have been engine troubles almost entirely. We have three sizes of engines on the same-sized tractors. They have 4¾-inch, 5-inch, and 5¼-inch bore. The largest engine is far less trouble than the medium size, and the smallest size is so much trouble that it is useless. My neighbors have had the same experience—the larger engines standing up better than the smaller. The larger engine, pulling the same sized load as our medium size, consumes practically the same amount of distillate and oil. The main difference is in the size of bore and stroke. What we farmers need is a tractor that will perform—and I believe by increasing the size of the engine and not using it up to its full power, the largest part of our troubles will be eliminated."

Idea Illustrated by Pumping.

There is little actual demonstration of the result of having a strong motor run at half capacity or so on a light tractor, but the theory of the thing is displayed in numerous cases in pumping. Everybody with much engine experience in pumping knows that if you connect up a five horsepower engine with a pump that it can just run, or that will make it run at nearly the top of its power all the time, trouble

THE HARROW for TRACTOR USE

USE a harrow behind the tractor that pulverizes every inch of soil—that prepares a perfect seedbed for the plant roots and increases the harvest. Once over the field gives perfect tillage if you use a

Clark Double
"CUTAWAY" Action

TRACTOR HARROW

The forged sharp disks of toughest cutlery steel cut deep, thoroughly mix the soil and leave it light, mellow and level. Rear gangs are forced to cut exactly midway between front gang tracks. The CLARK "CUTAWAY" Rigid Main Frame is made of heavy special steel which keeps all gangs from sluing and trailing.

Even, uniform cultivation—clear to the bottom of the furrow—results. Solid disks are furnished if desired, but cutaway or outout disks, if of CLARK "CUTAWAY" quality, do better work. CLARK "CUTAWAY" Double Action Tractor harrows have adjustable hitch and are made for any size tractor. They represent the perfected results of fifteen years' development of tractor harrows.

Ask your dealer about CLARK "CUTAWAY" Tractor Harrows and other special disk implements. If your dealer hasn't them, some nearby dealer has.

WITTE Engines

2 to 30 H. P.

Built Better—Cost less to operate and to own—Easy to understand—Few working parts—Strongly built—Every part guaranteed against defect during the life of the engine. Built from standardized metal patterns. Every part interchangeable and easily replaced by operator. Ask us for prices on all sizes. Stationary, Portable or Saw-Rig Outfits.

A. H. SIMPSON CO.

129 FREMONT ST.
SAN FRANCISCO, CAL.

will come soon and often. Yet, theoretically such an engine should work beautifully, since an engine works better when it runs almost to its capacity!

Now take away that five horsepower engine and put on a ten horsepower and the big engine will work along easily from spring to fall, night and day, if you will only keep it well oiled, the grease cups screwed down and everything in shape. Are you extravagant in the fuel and lubricating oil required, by using the big engine? None of the pump men seem to feel the strain of the extra expense if there is any. The lack of trouble and lack of repair bills attend to all that.

Now the pumping plant and the tractor are very similar in the point discussed. The engine in both cases works for long, steady intervals, and it works close to the limit of its power unless it is deliberately made oversize. That is NOT done with tractors, but it frequently is done, and very successfully so, with pumping plants. What is sauce for the goose should be sauce for the gander.

Other Suggestions.

Several other suggestions on the construction of tractors so as to reduce upkeep expenses are made by our rancher. First, have dust strainers on the carburetor intake (which has been almost universally done on tractors sold in California). Second, and this is considered more important than the first, have a dust strainer on the breather, which few if any tractors have. Third, have all the bearings as large and strong as possible. Wherever there is rubbing of parts there is wear, particularly with California dust, so make the bearings large and heavy enough to stand all the wear possible, and they will last longer than small bearings.

NO MORE STATE TRACTOR DEMONSTRATIONS.

No more State-wide tractor and implement demonstrations will be staged by the California Tractor and Implement Association. This was decided at their meeting nearly in November. But they also went on record in favor of local demonstrations and instructed their Demonstration Committee to perfect details of a plan to encourage organization of local tractor and implement dealers in each of eight or more districts into which the State would be divided for the purpose. This plan was presented and accepted at the Association meeting November 15. Provisional headquarters for the various districts, to be changed if the dealers in those districts prefer, are Fresno, San Jose, Salinas, Stockton, Sacramento, Marysville or Chico, Willows, and Santa Rosa.

Southern California is not included because a strong association already operates there. The State Association offers to furnish a manager to help organize local dealers and to help handle local demonstrations. Many dealers have expressed their desire for such organizations and demonstrations. Several such demonstrations have been held, notably at Fresno, Chico, and San Jose, rivaling or excelling in attendance the State demonstration at Sacramento last spring. Farmers will no more travel hundreds of miles to see the best tractor demonstration that could be conceived. But they will travel probably up to 100 miles to see a good demonstration in their own district. Such local events should continue to be great factors in proving the superiority of power farming.

A new tractor in Monterey county was put in charge of a young fellow because he worked cheap. The oil circulation stopped, but he didn't know it until the engine stopped. New cylinders had to be bought and new bearings poured and fitted. Moral: figure the economy for yourself.

A tractor user says certain tractor manufacturers have a reputation for robbery on repair parts that scares prospective purchasers.

Cheap drivers on good tractors give the tractors an evil reputation.

Killefer
Quality

Combination SUBSOILER and FERTILIZER PLOW

Killefer
Efficiency

**PUT MANURE INTO THE GROUND WHERE IT WILL DO
THE MOST GOOD.**

Our Subsoiler is easily made into a Furrow Plow by changing standards.

The Furrow Plow is handled from the seat of the tractor and is strong enough to go into any ground and make a good furrow.

Subsoil your orchard first. Break your soil so the water can get down into it, then attach the plow standard to the subsoiler frame and open up a furrow. Then put the manure into the ground.

This is the method employed by some of the most successful growers.

Fall Lambing of Ewes

(Written for Pacific Rural Press by Thos. F. McConnell)

It seems rather queer to a sheep man from outside of California to talk about "fall lambing," as in the East and the Rocky Mountain region it is of so rare a practice as not to justify much, if any, attention. In the colder climates very few kinds of sheep will breed but once a year and that in the fall. The Horned Dorset; an English breed of mutton sheep, will breed in the spring, but 99 per cent of the sheep do not in the eastern climates. In fact, the late John A. Craig, while Professor of Animal Husbandry at the Wisconsin College of Agriculture, attempted to breed some Shropshire-Merino ewes in late spring and early summer months, but without any success. Therefore, as said before, "fall lambing" to an eastern sheep man seems rather out of place.

Implements Required.

Every man that cares for and handles sheep needs a few implements not found on the ordinary ranch. A pair of sheep shears, a pair of "toe nippers," or hand fruit tree pruners, and if possible, a shepherd's crook. The shears will be useful in many ways mentioned hereafter. The toe nippers are used for shortening or trimming the horny toes of the sheep which grow quite rapidly and become entirely too long if sheep are not running on rocky or very gravelly soil, where they would wear off as rapidly as they grow out. A crook is not a necessity, but is a great convenience in catching sheep in the open.

A word here relative to handling sheep will not be out of place. Never catch a sheep by the wool. It hurts the sheep and they are not as easily held as when caught in the flank just forward of the hind leg. When caught in this manner they are entirely helpless and the largest sheep can be held and moved backwards with ease by any one. If the effort to catch in the flank fails the hind leg may be caught, but the sheep will struggle considerably but with no injury to itself. Sometimes when a sheep is running rapidly towards a person, placing the hand over the nose firmly will stop it easily and quickly and the flank hold can then be obtained. These suggestions are for use when sheep are in the yard or corral, but the same "holds" should be used in the open if no crook is at hand. The crook is chiefly for use in the open where the sheep cannot be approached easily.

Conditions and Dates.

Conditions as they exist in this State in most localities are much more favorable for the young lamb than anywhere else in the United States, therefore shelter, except in unusual cases, is not very necessary. It is always best, of course, to keep the youngsters in out of cold rains until at least a month old.

The date on which breeding was started should be noted, for if conditions are normal the first lambs may be expected about 148 days from that time. Some shepherds say they can tell by the way the ewes look when they are going to lamb, but if conditions are as they should be the lambs will arrive in about 148 days.

The young lamb is rather of a helpless little fellow when first born and many times needs assistance to get his first meal. If the lamb appears very weak it is better to place the ewe in a small pen, four or five feet square, for a day or two. The sheep shears may be necessary at this time if the udder of the ewe is at all difficult for the lamb to get at. The wool in both flanks and around the teats should be clipped off smoothly, care being taken not to clip off the end of the teats. The amateur should be careful at all times not to cut the skin when using the shears and if a large cut is made it should receive an application of pine tar to keep flies away. If the lamb appears strong and the ewe attentive, leave them alone for an hour or two if they are in a warm place. If the lamb is weak and unable to stand alone, it should be fed right away. There are several ways of doing this, but the main thing is to get

some new, warm, rich ewe's milk inside the young thing as soon as possible. Some shepherds set the ewe on her haunches in the same position as that for shearing, kneeling on one knee behind her and then laying the lamb on its side close to the udder. Open the lamb's mouth with one hand and milk a little into it with the other. Generally the lamb will commence to suck immediately. Let it have a good meal—all there is in one side of the udder at least. This depends somewhat, however, on how much milk there is and how many lambs there are.

Ewe Disowning Lamb.

The ewe once in a while disowns the lamb and will object strenuously to it. In this case place the ewe and lamb together in a small pen and visit them every hour or two and let the lamb suck. If it is vigorous it will soon learn to commence to try to suck upon the appearance of any one near the pen and the ewe will usually soon submit, and suddenly the mother love will assert itself. What had previously been an object of loathing will be the dearest thing on earth. If no pen is available tie the ewe with a short rope about the neck and confine the lamb near her so that she will have her seeming trouble near at hand.

Lambs That Are Chilled.

It sometimes happens that lambs born at night or on cold foggy days become chilled and almost die from exposure. Immerse them in water that is just bearable to the elbow. Water as hot as the hand can endure is sometimes too hot for the youngsters. Keep up the heat in the water by adding more until the body of the little fellow is thoroughly warmed through. Then rub dry, wrap all but its head in a warm blanket, and feed a little warm milk if it can be induced to swallow. If chilling was the only trouble this treatment will revive them very quickly.

Ewes That Lose Their Lambs.

A ewe whose lamb has died sometimes has a large quantity of milk. If there are other ewes in the flock that have twins it is often advisable to place one of these twins with the "lambless" ewe, and as we used to say, "make her own it." Confined together it generally takes only a short time for them to become attached to one another if the ewe has plenty of milk and the shepherd visits them regularly to allow the lamb to suck.

Excess Milk.

Sometimes ewes that are excellent milkers need especial attention immediately after lambing, as the lamb may not be able to take all the milk and only feeds from one side. If this condition is not attended to by milking out or feeding some needy lamb from her until her own lamb is able to take all the milk, one-half the udder or sometimes the whole of it will be permanently injured.

Condition of Lamb.

The condition of the lamb's nose is a very good indication of the health of the little fellow. If the lamb is lying down and it is difficult to know whether it is just sleeping or in a semi-comatose state due to ill health, the nose will tell the story. Place the finger on the end of the nose, and if it is cold then something is wrong, but if it is warm then all is well.

Creeps for Lambs.

If confined in small lots or corrals it is a good thing to have some ground grain or wheat bran placed where the lambs can reach it without interference from the old ewes. It will surprise those not familiar with young lambs how soon they will commence to eat solids and how much faster they will grow for this extra feed.

Ewes at lambing time should receive extra good feed from that time until lambs are weaned. Unless pasture is exceptionally good they should receive a little extra feed so that the milk supply will be generous.

The water supply should always be good, but at lambing time it is doubly important.

Pacific Rural Press, 525 Market St. San Francisco

SUREMILK

"A Sperry Product"

The Feed
That Tells
in The
Flow

Your cow, to produce a full flow of milk the year 'round, requires a feed with *five times* as much carbohydrates as protein. Take alfalfa hay, for example. For the amount of protein it contains, alfalfa hay has only half as much carbohydrates as it should.

What your cow needs to make her a really profitable producer is SUREMILK—

A highly concentrated grain feed

It is rich in carbohydrates—containing nearly 64 per cent. It is very low in moisture, ash, fibre and protein—for alfalfa hay or other roughage will supply these more cheaply.

Remember this: just as alfalfa hay is the ideal roughage, so SUREMILK is the ideal grain concentrate. *Together*, they enable the cow to produce the greatest amount of milk with the least drain on her vitality and the least strain on your pocket-book.

Best Blue Ribbon Berkshires

(Written for Pacific Rural Press.)

Business and Berkshires. That is the combination at Castleview Ranch at Santa Rosa. Mr. O'Connor, the proprietor of the herd, takes a great deal of pride in his beautiful black swine. They are not exactly "the apple of his eye," but they come very close to it. He not only takes pride in them from the aesthetic point of view, but believes in them as an economical producer of pork, although outside of barrows for exhibition purposes Mr. O'Connor does not raise market hogs. He sells his pigs that are not as true to Berkshire

Angeles Show six weeks later she had developed into a grand champion sow. Mr. O'Connor put her in the Berkshire sale at Los Angeles and she topped the sale, going to F. L. Hall of Perris for \$510. She was kept in the Castleview herd, however, and shown at the California International, where she was again made grand champion sow of the breed.

Mr. O'Connor did not show a full herd this year, but says that another year will see him in the ring with enough to fill all classes, and if his

Castleview Premier Belle, grand champion Berkshire sow at the California International Livestock Show. Bred and raised by J. Francis O'Connor, Santa Rosa.

type as they should be for feeders to farmers in the surrounding country.

Mr. O'Connor believes in believing in the hogs he is raising, and therefore in promoting his favorites by all fair means possible. While Sonoma county is not noted as yet as a swine-breeding center the majority of hogs raised are Berkshires, and while the Brush herd no doubt had great influence in this respect in the past it is now due largely to the efforts of Mr. O'Connor that the breed is going forward in the estimation of the hog-buying public wherever his influence is felt.

Castleview Premier Belle, exhibited as a senior sow pig at the fairs and stock shows this fall, was bred by Mr. O'Connor. Her sire was Iowana Rival Champion and her dam Premier's Hopland Belle. This young sow was first in class and junior champion at the State Fair this fall. This was early in September and by the time she was shown at the Los

winnings are in proportion he will sure be "in the money." Through good business methods and good hogs he has become a power in the ranks of the Berkshire breeders on the Pacific Coast.

Saving food is the same problem whether it's war time or high-cost time. "What Shall We Eat on Wheatless and Meatless Days?" is still a practical question for the housewife who saves. Send for Circular 108, Wisconsin Experiment station, Madison.

Clyde Horr of Susanville, Lassen county, came to the State Fair with a very creditable showing of Poland-China hogs, and has the honor of being the first man to bring an exhibit of registered live stock from Lassen county to the State Fair.

Tepary beans ground fine and mixed with cane molasses makes excellent hog feed, it is said.

The Chester White Will Start You Right

LIVE OAK, Sutter Co., Cal.

Durham Colony Boosting Livestock

(Written for Pacific Rural Press by R. E. Hodges.)

There is no tuberculosis in the cattle or hogs on the Durham State Land Settlement! What will that mean to the settlers of this community and to their children even to the third and fourth generation! There are about 350 cows and about 170 sows on the project, according to Superintendent George C. Kreutzer. All of the cows have been tested at least three times for tuberculosis and every tubercular cow has gone out. This has led people from far parts of the State to come here for breeding hogs, knowing that they have not been fed tubercular milk.

Dairy Cattle Auctioned.

Under the policy of the State Land Settlement Board of encouraging settlers to keep livestock, the practice has heretofore been to buy a bunch of cattle and assign them to various settlers by lot. Just recently a couple of settlers were delegated to attend a sale of high-grade Holsteins and buy a bunch for distribution to the rest. But instead of drawing numbers from a hat this time, a price was put on each cow and settlers took their pick. Where more than one wanted a cow, it was auctioned to the highest bidder. All of the producing cows moved readily. Only half a dozen young females failed to bring the prices posted. These were set aside and auctioned later. The whole auction lasted two hours and netted \$500 above cost. The second cow put up had a record of production and was valued at \$180, but she brought \$330. The \$500 wiped out a \$300 loss on a bunch of tubercular cattle which had previously been bought as healthy cattle and sacrificed when tested. The extra \$200 is laid aside to apply on an additional community bull, which is now needed.

Community Livestock Sires.

The colony already has two registered Holstein bulls, one a grandson of Tilly Alcartra and one which was said on good authority to be the best in the fine herd it came from. These animals are kept by one of the settlers, and cows are taken to them. The caretaker's pay comes in the form of small fees. A registered Duroc boar was donated by the breeder of one of the best herds in the State to be used as a community boar. Though still a youngster his pigs are showing up fine and he is considered worth over \$500 now.

Central Separating Plant.

Most of the herds in the settlement are small, many of them not over seven cows. The settlers are hardly able to afford cooling and separating machines, so the State Land Settlement Board, according to its chairman, Prof. Elwood Mead, last spring established a central separating and chilling plant for all who might want to haul their whole milk to it. The output of this plant is being sold as sweet cream and milk at a 9-cent premium. Some of the settlers are planning to sell raw milk.

Loaned \$100,000 for Cows.

The Land Settlement Board is lending about \$100,000 this year to help settlers put in new cows. A good example of the reason for this is the case of a family who were milking seven cows and getting about \$100 a month income. They could live on this, but could hardly make payments on the land. They had a crop of "gyp" corn and the stalks were no good except for pasture. Prof. Mead told them they could double their income by doubling the number of cows. The Board loaned them the money, taking a mortgage on the cows the settler already had, and they will come through the winter with their \$400 annual payment made and cash ahead.

Local Banker Wakes Up.

Though the law gives the Board power to lend money on stock and improvements, the Board has no desire to engage in banking. The local banker has recently shown himself educated up to present-day farm financing. He proposed to the Board

that any settler who needed money and could get a recommendation from the Board for a loan could get it in the bank on six per cent interest on whatever repayment terms are recommended.

New Projects Chosen.

Many tracts of land to be subdivided under the new projects authorized by the 1919 Legislation have been offered to the Board. Investigation has narrowed the probable choice to one of four or five. The decision will have been made at an executive session of the Board on October 25.

The Annual Meeting of the National Swine Growers' Association will be held Monday, December 1, at Chicago. The Louis 14th Room in the Hotel Sherman will be the meeting place.

Dairy Notes.

Seldom have a finer lot of Registered Holstein bulls gone into a grade herd than those recently purchased from The Lewis Company by Mr. Davis for the Sleepy Hollow Dairy, Marin County.

Official testing has been commenced by The Lewis Company on their Holstein herd, and the animals will be put on yearly test. In the seven-day division, several good records not yet reported include a 23.77 lb. two-year-old daughter of Sir Leda Korndyke.

E. B. McFarland of San Mateo, proprietor of Steybrae Ayrshire Farm, during the California International, sold six Ayrshire cows to Harold Rice of Paia, Maui, T. H., for \$4500. Mr. Rice knows a good breed of dairy cattle evidently.

Some of the Holstein-Friesian herds of California recently beginning or renewing testing are J. H. Posty, Jr., Atwater; H. G. Ball, Tulare; E. M. Morrow, Modesto; Geo. Maze, Modesto; L. B. Van Blaricom, El Monte; W. D. Millard, Arcadia; H. Hill, Riverside.

During October twenty-eight Holstein-Friesian herds in California carried on official seven-day tests with twelve working on 30-day tests. A total of almost fifty Holstein-Friesian herds have carried on official seven or thirty-day tests during the past year.

The Lewis Company reports sales from its Baywood Herd of Registered Holsteins, located at Hollister, as follows: to the Abel Ranch, Milpitas, a son of the good foundation cow Countess Creamelle Vena; heifers to E. Grebe, San Jose, and Joseph W. Seitz of Cupertino, and several sons of good A. R. O. cows to the H. K. Herzog Company of San Anselmo.

The American Jersey Cattle Club has started a campaign to have 10,000 Jersey cows on semi-official test by January 1st, 1920. The California quota is 200 head, and Oregon 600 head. Previous to July 1st, California had 91 head on test and by November 1st 153 head. Breeders of pure-bred Jerseys should be sure and have 47 head more in the testing line by the first of the year.

Dr. R. E. Duckworth has completed a State test on The Lewis Company's Baywood Herd at Hollister, reporting a clean record on every animal in the herd. This herd has an enviable record, being able to show either a living calf or record of a sale of calf from every mature animal on the farm. Great credit is due Martin Ziegen, herdsman, for the condition of the animals, especially a remarkably fine calf herd.

Laura Maki, the seven-year-old Holstein-Friesian cow owned by the Palo Alto Stock Farm and bred by the Vina Ranch, recently completed a 365-day test that places her in the list of great cows of the breed. She produced 25.38 lbs. fat in seven days, 112 lbs. fat in 30 days, and 2989.9 lbs. of milk and 1061.27 lbs. fat in 365 days. She has a butter fat test of a fraction over 3.55 per cent, which places her among the high fat percentage Holsteins.

California is developing into a great dairy state but has as yet but forty-seven herds of pure-bred dairy cattle that have been on semi-official test. Of these 3 herds were Ayrshires with eleven head tested; 8 herds were Guernseys with 46 head tested; 18 herds were Holsteins with 188 head tested, and 20 herds were Jerseys with 153 head tested. This is pretty good, but it seems as though there ought to be a greater total than 402 head for such a great State.

The J. S. Gibson Company of Williams, have some excellent first calf heifers that have just finished seven-day tests as follows: California State Fair Queen, 378.38 lbs. milk, 11.966 lbs. fat; King Korndyke Pontiac Princess, 592.1 lbs. milk, 17.684 lbs. fat; Queen Pontiac Charlotte Korndyke 481.7 lbs. milk, 14.554 lbs. fat; Miss Korndyke Acme Alcatraz 413.9 lbs. milk, 12.467 lbs. fat; Princess Rima Modura, 400

months after calving, 364.1 lbs. milk, 11.674 lbs. fat. In addition to these there are some very promising ones to freshen soon with a large percentage of them daughters of Prince Alcatraz Korndyke.

Swine.

The auction sale of Duroc-Jersey swine scheduled by W. T. Hollingshead & Sons of Orland, for November 11th, was postponed on account of Armistice Day. These well-known breeders will hold a sale early in the new year when they will have one of the finest lot of Durocs ever offered at public sale in California.

The Glenn County Poland China Breeders' Association have a sale scheduled for January 14th next. This will be the initial sale of this association, and the breeders of that county are fitting up a great lot of the "black beauties" for this occasion. R. J. Yates, the veteran breeder, will have a fine consignment which alone is a great inducement for those interested to attend.

V. F. Dolcini of Davis, breeder of Holstein cattle and Duroc-Jersey swine, has purchased a herd sire from the Waltemeyer herd of Durocs that is a dandy. He is an animal of great size, superb quality, and an excellent individual among the best. His litter mate was junior champion boar at the Iowa State Fair this year, which was sold for the world's record price, at his age, of \$3300. Another litter mate was first prize junior gilt at Iowa also, and sold for \$1,500.

William Bernstein, the prominent Poland-China breeder of Hanford, will have an auction sale of topnotch Poland-Chinas on November 29th. There will be some bred sows and some boars, and besides there will be a great lot of open gilts—probably the best lot of gilts ever offered in California. Mr. Bernstein has been in the Poland-China business for years, and has always been right up in the fore ranks of progressive breeders, and the hogs offered in this sale will be a demonstration of this.

A. Buckland & Son of Fresno, breeders of pure-bred Poland-Chinas, report a large number of recent sales. They are as follows: Three December gilts to the Kern County Pig Club, Bakersfield; one service boar to R. C. Whitworth, Hanford; one service boar to Frank Schofield, Fresno; five March gilts to the Madera High School Pig Club; five September sow pigs and one boar pig to Madera County Pig Club boys; one service boar to Fred Wheaton, Hanford. The above sales by mistake were credited to J. F. McSwain of Merced.

W. H. P. Shand, breeder of Willows, Glenn County, proprietor of the Ureeda, Glenn County Herd of Duroc-Jerseys, have changed the name of their herd from the above cognomen to that of the "Key Herd of the Pacific Coast." These prominent breeders are moving their herd to their new location on the State Highway, north of Willows and near Artois (German town). Messrs. Shand's business has increased to such a degree as to make it necessary to employ a herdsman to relieve the junior member of the firm from some of the routine of the care of the herd. Mr. Elmer Reed of Lyons, Nebraska, who formerly worked for Manley Zros, Duroc-Jersey breeders of that place, will have personal charge of this great herd. Mr. Reed is an excellent judge, one of the best feeders and breeders found anywhere. A "live wire" in the Duroc-Jersey business, and a great believer in his favorite breed. He is a welcome addition to the Duroc forces of the Pacific Coast.

Wool stocks of sufficient size to supply the United States for a year at the present rate of consumption were on hand at the close of the quarter ending September 30th, according to recent announcement by the U. S. Department of Agriculture. Total sales for the quarter 1919, 373,000 pounds, 80 per

cent more than was on hand the same date a year ago.

TULARE HOLSTEIN-FRIESIAN SALE.

The Tulare Guaranty Sale of Holstein-Friesians scheduled for November 25th will have cattle from most of the leading herds of that locality. Prominent among the consignors are W. J. Higdon of Tulare, and J. P. Phillips, proprietor of the Allana Farm at Fresno. A mere mention of

these herds is enough guaranty for individuals from them.

Mr. Higdon is consigning, among others, a daughter of Mutual Fobes De Kol with a seven-day record of

PUBLIC SALE OF

52 REGISTERED SHORTHORNS 52

STATE FAIR GROUNDS, SACRAMENTO, CAL.

Tuesday, December 11, 1919

By

W. C. SHORT, RENO, NEVADA

An attractive offering of young sows, heifers and bulls from one of the oldest established herds in the West. The herd was established in the seventies by Mr. A. Banta, Mr. Short becoming a partner in 1898 and sole owner in 1914.

For this first public sale, only the best young bulls and females are offered. All are of deep red color, and in good range condition. They are inbred and tested and guaranteed to be breeders.

For catalog and further information, write

COL. ORD. L. LEACHMAN, Auctioneer

1111 Seventh Street, Sacramento, Cal.

25.43 lbs. of butter and a daughter of the grand champion bull at the State Fair, King Segis Alcartra Prilly.

Mr. Phillips is consigning three altogether—two of them with excellent records backed up by the very best of breeding. This herd is strong in the far-famed Ormsby blood, of which the world's record butter cow, Dutchess Skylark Ormsby, is one.

Any one wanting foundation stock or additions to their herds should attend this sale and get some of the good ones.

DRESSED CARCASS CONTEST.

The California International did not have as great a contest in this line as was desired, due to the fact that many of the prize-winning animals were to be taken to other shows.

The University of California won on steer, wether and lamb. M. & A. L. Bassett won first with a Poland-China on hog carcass over 200 pounds, and C. B. Cunningham first with a Chester White on light hog carcass. M. & A. L. Bassett won grand champion carcass with a Poland-China over all competitors. The dressing percentages and placings are given below.

Carcass of steer or heifer, 1 year old and under 2, entered in regular classes—University of California, Davis, Cal., on Angus steer.

Champion carcass, competition limited to first-prize winners in above class—First and Grand Champion, University of California on Angus steer; dressing percentage, 64.

Carcass of wethers, 1 year and under 2—University of California on Southdowns.

Carcass of Lambs—University of California on Southdowns.

Dressed carcass over 200 lbs: 1st, M. & A. L. Bassett, Hanford, on Poland-Chinas, 84.3 dressing percentage. 2, M. & A. L. Bassett, Hanford, on Poland-Chinas; percentage, 84.5 3, M. & A. L. Bassett, Hanford, on Poland-Chinas; percentage, 84.6.

Dressed Carcass, light—1st, C. B. Cunningham, Mills, on Chester Whites; percentage, 79.9. 2, B. Grant Hollis, Sebastopol, on Berkshires; percentage, 80.0. 3, B. Grant Hollis, Sebastopol, on Berkshires; percentage 84.5.

ANDERSON'S BERKSHIRE SALE.

Frank B. Anderson of Sacramento, secretary of the Western Berkshire Congress, announces that he will hold a public sale of forty head of registered Berkshires at the State Fair Grounds at Sacramento on Tuesday, December 2nd. Anderson will offer a number of bred sows and gilts, a few boars of service age and a lot of Spring boars and gilts. Among the offering will be several head that Anderson won with at the Fall shows. Col. Ord L. Leachman will officiate as auctioneer.

Devon cattle, one of the oldest of the British breeds, is supposed to be descended in a direct line from the bos longifrons, the smaller of the aboriginal type of British cattle.

FOR SALE—Registered Percheron Mare and eligible mare colt. Unusual opportunity for someone. Forest W. Wood, San Luis Obispo, Cal.

Livestock Queries and Replies

Starving Pigs.

To the Editor: I have a bunch of pigs that I bought in September last. They all looked fine and healthy with the exception of one, which was poor and weak, with no appetite. Fearing it might be diseased, I killed it. These pigs were supposed to be about 8 weeks old when I bought them. I fed them beans and potatoes cooked together with some green corn, ripe pears and apples. The last 3 weeks they have been fed mostly Hubbard squash. They seem to have good appetites and I think they are free from lice, but they do not grow. They have big bellies and are poor. Can you tell me the trouble with them and the remedy?—W. S., Monterey.

(Answered by Livestock Editor.)

The pigs have not and are not receiving feed of the proper kind. Shots 4 or 5 months old might live on Hubbard squash, but even they would have to eat such large quantities in order to grow that it would cause more or less abdominal distension. Potatoes and beans cooked together ought to help some now if the cooking is thoroughly done. Some of the cane molasses advertised so much lately would help this mixture. Green corn is not a very good hog feed unless there are plenty of ears pretty well along toward maturity. We would advise feeding some heavy wheat middlings, 9 parts, and tankage 1 part, made into a thick slop with water, or omit the tankage if skim or buttermilk can be obtained. Feed about 2 pounds by weight of the middlings and tankage per hundred weight of pig along with the squash. This is not enough to promote the most rapid growth, but will help. Ground barley or Egyptian corn can be used in place of the middlings, but they seem to be the most acceptable to the young pigs.

Tubercular Bull.

To the Editor: A year ago I purchased a herd of high-grade Jersey cows in Oregon. They had been tuberculin tested and pronounced free from tuberculosis. Last spring I secured a Durham bull, and after breeding all my cows I discovered this bull had tuberculosis. Is it liable to infect my cows? Would it be prudent to raise the calves or "veal" them?—Old Time Subscriber, Montague.

(Answered by Livestock Editor.)

There is always danger of the rest of the herd becoming infected if there is even one diseased animal among them. If you want to keep a clean herd get rid of those known to be infected. Then have the rest tuberculin tested again, getting rid of all those that react. Clean up around the prem-

ises, whitewash all stables and corral fences. Have all stables well lighted and ventilated. Keep the calves separate from the rest of the herd, and if possible pasteurize the milk fed the calves. Have cattle tuberculin tested every 6 months or at least annually. Bring in no cattle without first having them tested for tuberculosis. Do not feed milk from reactors to calves without pasteurizing it. The better way is to have no reactors.

Milk and Bacteria.

To the Editor: Which of the following are generally most responsible for the (high) bacterial count in non-pasteurized milk, manure and dirt particles or the bacteria in unclean milk utensils? To what temperature is milk heated in manufacturing cheese and is it usually heated to the pasteurizing point in or before making butter and condensing milk?

(Answered by Livestock Editor.)

There is no way of answering the first question positively, but we would suppose in the careless, filthy dairyman's operations, one would about equal the other. It is possible, however, to have the utensils so clean that the bacteria getting into the milk in this way are a negligible quantity. In open clean buckets used in hand milking the bacteria would practically come from outside, say from udder of cow, dust particles in the air, the milker's hands and clothing, etc. Again, in machine milking the bacteria would almost necessarily gain access by the milking utensils, except those in the fore milk and on the teats.

Milk in the manufacture of cheese is heated but little. The proper temperature for it when the rennet is added is about 85 degrees Fahrenheit and the temperature at which the curd is "cooked" or heated varies from 96 degrees to as high as 102 degrees Fahrenheit. From this it appears that the process of cheese-making is not one of cooking as it is generally understood.

Much of the cream at the present time is pasteurized before being made into butter for the purpose of destroying bacteria inimical to the delicate flavor of good butter. All condensed or evaporated milk is sterilized.

It is officially announced in Bradford, England, says the London Daily Telegraph of recent date, that the British War Department intends to issue licenses for the export of wool to Germany following a decision of the wool section of the British Ministry of Munitions to allow all foreign countries to participate in the purchase of colonial wool in Great Britain owned by the Government.

Her Health Was Not Left to Chance

The cows that make the big milk records are well fed and well bred, to be sure. But, above all, they are in the pink of condition. The constant strain of heavy milk production will wear down the vitality of the digestive and genital organs in the best of cows, and the result is such ailments as Abortion, Retained Afterbirth, Barrenness, Scouring, Bunches and Milk Fever. Any of these diseases can be successfully treated and eliminated with KOW-KURE, the great cow medicine. The medicinal properties of this famous remedy act directly on the organs of production and reproduction, putting the cow's system back to normal, healthy action. Feed dealers and druggists sell KOW-KURE; 60c and \$1.20 packages. Consider cow-health first, and your dairy will be a leader, and a money-maker. Our free treatise,

"THE HOME COW DOCTOR," will give you valuable pointers on how to treat and prevent cow diseases. Ask for your copy. Dairy Association Company, Lyndonville, Vt.

Health Pays!

This perfect three-year-old Jersey has a yearly milk record of 17,793 lbs. Nothing short of 100% health would make such a record possible.

Try raising the health standard of your cows; it will increase your milk profits.

PURE HAWAIIAN CANE MOLASSES

PORK PRODUCTION

By actual test will increase pork production five-tenths pounds daily over a barley and tankage feed, yet it sells for less than half the price.

MILK PRODUCTION

One of our customers writes: "We are out of molasses and our cows are falling off in their milk badly, hence we would appreciate immediate shipment. Kindly ship us two tons more in addition."

We supply it in barrels or tank cars for shipment anywhere.

Auction Sale of Fat Stock

The results of the auction sale of the fat stock shown in competition at the California International Live Stock Show is given below and is worth the careful study of those interested in such matters. In a previous issue will be found comment on the sale of the first and third prize Shorthorn steers sold to the Palace Hotel.

The fat hogs sold high, but even the highest-priced carlot consigned by M. Bassett of Hanford did not bring so much as the top carlot sold last week

at Fresno by the Farm Bureau Marketing Association at auction. Even the second carlot at the Farm Bureau sale sold for 25 cents more than the top in this sale. This certainly speaks well for the Farm Bureau sales. The detail of the sale is given below.

First prize Shorthorn steer, consigned by Ormondale Co., Redwood City, Cal. Sold to D. M. Linnard, Palace Hotel, San Francisco. 20c per lb.

Third prize Shorthorn steer, consigned by T. T. Miller, Hollister, Cal. Sold to D. M. Linnard, Palace Hotel, San Francisco. 20c per lb.

Second prize Angus steer, consigned by University Farm, Davis, Cal. Sold to Napa State Farm, Napa, Cal. 17c per lb.

Three Duroc Barrows, consigned by V. F. Dolcini, Davis, Cal. Sold to South San Francisco Packing Co., San Francisco. 15 1/4 c per lb.

Four Yorkshire Barrows, consigned by Lloyd and Tointon, Santa Rosa, Cal. Sold to South San Francisco Packing Co. 15 1/4 c per lb.

Fourth prize Chester White barrow, consigned by C. B. Cunningham, Mills, Cal. Sold to South San Francisco Packing Company, San Francisco. 15 1/4 c per lb.

First prize senior Berkshire barrow and Third prize Poland-China barrow, consigned by University Farm, Davis, Cal. Sold to South San Francisco Packing Co. 14c per lb.

First prize yearling wethers, consigned by University Farm, Davis. Sold to Gehl Packing Co., Santa Barbara, Cal. 13c per lb.

Third prize, 15 head steers, consigned by Newhall Land and Farming Co., San Francisco. Sold to Western Meat Co., San Francisco, Cal. 13 1/4 c per lb.

Reserve champion lot 15 steers, consigned by C. Swanston and Son, Sacramento, Cal. Sold to California Meat Co., San Francisco, Cal. 14 1/4 c per lb.

First and fourth prize lots two cars steers, consigned by Western Meat Co., San Francisco. Sold to C. B. Harris, Los Angeles, Cal. 15c per lb.

First prize and Champion carload Berkshire heavy packer hogs, consigned by Napa State Hospital, Napa, Cal. Sold to Western Meat Company, San Francisco, Cal. 15 1/4 c per lb.

Third prize carload Berkshire light packer hogs, consigned by Napa State Hospital, Napa, Cal. Sold to Western Meat Company, San Francisco, Cal. 15 1/4 c per lb.

Second prize carload Poland-China heavy packer hogs, consigned by M. Bassett, Hanford. Sold to Western Meat Company, San Francisco. 17c per lb.

Second prize carload Poland-China, light packer hogs, consigned by M. Bassett, Hanford. Sold to Western Meat Company, San Francisco. 16c per lb.

"CARRUTHERS FARM STILL IN THE LEAD."

This is the way Mr. Carruthers put it when he announced the sale of a heifer calf to Dean Curtiss of the Iowa College of Agriculture. The calf will be a year old on February 1st next, was sired by Hallwood Villager out of a Butterfly cow, and is named Live Oak Butterfly 2nd. The calf will go East by express in the University car going to the International at Chicago, and is to go into the superb private herd of Shorthorns owned by Dean Curtiss, who says "she is good enough to be a credit to any herd." This is said to be the first Shorthorn bred in California to be taken East to be placed in a private herd.

In speaking of the sire of this heifer, Hallwood Villager, Dean Curtiss said: "He is the greatest Villager bull living today." This from such an authority is a very strong endorsement, to say the least.

MILKING SHORTHORN BREEDERS ORGANIZE.

During the week of the California International Live Stock Show the Milking Shorthorn breeders met on Tuesday and elected officers and adopted a constitution and by-laws for the purpose of placing the merits of the cattle they breed and raise before the public in a better manner than heretofore. The territory included in the organization comprises the States of Arizona, California, Nevada, Idaho, Oregon and Washington. W. B. Ayre of Carlton, Oregon, assisted in making up the constitution and by-laws and other matters coming before the meeting.

Officers elected were Miss Alexander of Alexander & Kellogg, president; Chas. Weaver of Tulare, vice-president; Thos. Harrison of Santa Rosa, secretary-treasurer. The next meeting will be held at Portland, Oregon, during the week of the Pacific International.

The farmer who talks of profiteers ought to look also to his own dairy herd and poultry flock.

Over a million squirrels in the Livermore Valley and Altamont hills will no longer suffer hunger for California

grain, as estimated by A. E. Gray, who has had charge of the distribution of about ten tons of poisoned barley.

ORMONDALE SHORTHORNS

All heavy-boned Scotch or Scotch-topped breeding.

Herd headed by Golden Goods Junior, sire of Little Sweetheart, winner of 1st premium in two-year-old heifer class, and also awarded grand championship in both the State Fair and the Los Angeles Livestock Show in 1919; sire also of Ormondale Maid 2nd, winner of 2nd premium in the strongest junior yearling class ever shown at the California State Fair.

Every animal positively guaranteed.

Prices on application.

Poultry and Rabbits for Profit

SHOULD THE "STANDARD" BE REVISED?

As this is the season of numerous poultry shows, and as interest at these shows is largely centered in the "judging" feature, it is interesting to sift out sentiment as to which of the two methods of judging is best—judging for "feathers" or judging for "utility." The partisans of feather, color, and shape have had it pretty much all their own way in the past, and it is only recently that the sticklers for "utility" have begun to talk loud enough to be heard. The old time-honored method known as "Standard," says the Poultry Item, is where the judge is governed by rules laid down in the "Standard of Perfection," which rules are formulated by the American Poultry Association, and apply to outside appearance rather than to what may be on the inside of the bird, or what it will produce.

The other style of judging or "selecting," as it is called, is really judging a bird for what it has done in the past and what it should do in the future, considering its past performance. This class is sometimes called the "utility class." Quite a number of shows have put on these classes and have been judged accordingly. Recently in Missouri the breeders protested against the utility class at the State Show. This is the first open hitch we have heard between the two methods of judging. Practically all the State Extension Departments have a force of men at work demonstrating how to "select" birds that show high egg production.

The methods of judging for these high producers are on outside characteristics that indicate the inside condition of the fowl or what she has done or can do. One of the strongest points is the fading in color of legs, beak and skin in the yellow legged and skinned breeds. The theory—and this is a good one—is that a hen that has laid heavily during the year will show white legs and skin in the fall. It has been proven that a hen that lays heavily in her first year is nearly always a heavy layer in her second year. Also in selecting for egg production—or judging for it, as you may please—the hen that molts early is usually a poor layer for that particular year, but the one that molts late is nearly always a good layer. So that when the Standard calls for nice yellow legs in hens and nice smooth plumage, the hen that has laid few eggs will win in the Standard judging, where her sister that has laid 200 or more eggs will not often get even a pleasant look.

Can Standard breeders and judges go on defying, as it were, the recent discovery that certain physical characteristics indicate heavy egg production? Or shall the egg production breeders and judges go on selecting any mongrel-looking, despicable hen regardless of shape, just because she produces a few more eggs—than her nice, uniform standard-bred sister? If these two classes of "extremists," so called, are allowed to have their way, Standard-bred and egg production will drift apart.

The great majority of poultry raisers want a beautiful fowl as well as a useful one—an egg producer. There will always be people who will breed for fancy points alone and ignore egg production. Just as true will there be a big school who will breed for egg production, regardless of other considerations.

What is to be the best interest of the poultry industry today—best to serve for the greatest good to the greatest number of people, over the longest period of time? Does the American Poultry Association want to keep abreast with modern discoveries and developments? Or does it want to stand still and "see what it shall see" in the next few years? It is true the next revision of standard is three years off, yet it is none too soon to look the matter squarely in the face. Shall the Standard be modernized to allow for egg production or not?

ATTEND THE OAKLAND POULTRY SHOW.

Our poultry, pigeon and rabbit readers who can do so should make an effort to attend the Annual Joint Thanksgiving Show to be held at the Oakland Municipal Auditorium, November 24 to 30, inclusive, under the auspices of the Alameda County Poultry Association. An invitation is extended to all breeders on the Pacific Coast to co-operate with this Association in making it a great success, as it no doubt will be. Entries must be made not later than November 25 at 10 a. m. The poultry judging will be done by R. N. Moore, C. G. Hinds and W. S. Russell.

WATER GRASS SEED FOR CHICKENS.

To the Editor: What is the feeding value of water grass for chickens? I can buy some for \$2 per 100 lbs., with some broken rice mixed in. I use it for the morning mash—2 parts (by measure) of bran, 1 part of water-grass seed mixed with sour milk, or if I have no sour milk I use one-third part commercial meat scraps and mix with hot water. At night I feed whole grain, wheat, and white Egyptian corn alternately. My chickens have free range and access to alfalfa. They seem to like the mash and eat it greedily, and I am getting about as many eggs as can be expected at this time of the year.—F. W., Chico.

In the proportions mentioned above water grass seed is a valuable poultry feed. Its commercial value depends somewhat on whether it is well matured and is full seed, or there is more or less husk. At present market prices of grain we believe the sample sent indicates a value of from \$1.50 to \$2 per hundred pounds, depending on the quality of the sack used in packing and the cost of getting it to the poultry plant.

The free use of an effective lice powder is always advisable. A dust bath, consisting of road dust and wood ashes, is essential in ridding fowls of lice. Sodium fluorid, a white powder which can be obtained from druggists, is also effective. Apply a pinch of the powder at the base of the feathers on the head, neck, back, breast, below the vent, base of tail, both thighs, and on the underside of each wing.

PURE ANIMAL MATTER
AMMONIATES

FOR CALIFORNIA SOILS

VARIOUS AILMENTS.

To the Editor: I noticed lately that one of my white Leghorn pullets appeared to be lame, then she drooped her wings, then frequently carried her neck extended and distorted, then she appeared to be unable to move and squatted or perhaps fell over. Another seemed to have something the matter with her throat, for she was gasping until she died. I have been giving asafoetida on the theory that it may be worms, but have noticed no improvement. Can you diagnose the trouble for me?—G. E. S., Mountain View.

The first-mentioned pullet may have been egg-bound. The description of her actions also indicates that she may have been poisoned by eating deadly nightshade, reference to which has been made in recent issues. Fowls that are poisoned by this plant hold the head at unnatural angles; the eyes are set; and they frequently attempt to run backward, which results in falling. The second pullet may have been much out of condition due to excess of starchy feed or a serious lack of building material and greens. With growing pullets this is frequently the cause of a distemper that affects the crop and throat, resulting in continuous gasping as described.

HENS ARE CONTRARY.

To the Editor: Will you kindly tell me the best method of making nests for laying hens? I have fifty pullets just beginning to lay and they persist in laying all around the poultry yard rather than in the box nests, although I have put in clean, new straw. Is it best to put in nest eggs?—E. C. H., Stockton.

There are many ways of making a practical and convenient nest for hens. It depends on local conditions which is the most convenient nest for the attendant; a hen that is educated to lay in a constructed nest will lay in any sort of a nest, provided it is free from vermin. As the easiest way to properly educate the pullets, we recommend putting one or more mature laying hens with them just as the pullets become ready to lay. The hens and pullets know that the artificial nest eggs are not real, but the nest eggs provide more or less of an incentive for the fowls to lay where they are placed.

WHAT IS A "CHICKEN FARM"?

The U. S. Census Bureau, for purposes of its own, has recently issued an official definition of a "farm." Back lot chicken yards are barred out, unless it covers a certain area of ground, calls for certain services, and yields a certain minimum income. Regardless of the pardonable pride of the proprietor, these are the minimum requirements: "If a garden or chicken yard expands until it covers not less than three acres of ground, or it requires for its care the continuous services of at least one person, or yields products annually to the value of \$250 or more, it comes within the census definition of a farm and will be recognized as such and counted."

BLACK TURKEYS.

A subscriber wishes the address of some one keeping black turkeys. Our classified columns are an excellent medium through which raisers of poultry of all kinds can reach prospective buyers.

Fowls for breeding purposes should be strong, healthy and vigorous. The comb, face and wattles should be of a bright color; eyes bright and fairly

Winter Layers Need Help—get more eggs

Offset winter conditions—get eggs when prices are highest—supply the natural elements that stimulate egg-making.

Dr. LeGear's Poultry Prescription is especially prepared to insure the vigor and vitality so necessary to thrifty, profitable winter laying. Thousands of poultry raisers bank on feeding this remedy for bigger winter egg yields.

Better Laying Guaranteed

Dr. LeGear's Poultry Prescription is the best conditioner and tonic that you can provide for your flock. It positively makes your hens lay more eggs and gain most in flesh from the feed consumed. For twenty-seven years a practicing graduate veterinarian, Dr. L. D. LeGear propounds his own prescriptions and guarantees results. Sold on a money back guarantee by over 40,000 dealers—never by peddlers. See your dealer today.

Dr. LeGear's Lice Killer (Powder) rids your flock quickly of lice, protects chicks, etc.

Dr. LeGear's Diarrhoea Tablets keeps chicks in normal condition, regulates bowels and system.

Dr. LeGear's Stock Powders produce perfect digestion, drive out worms, increase growth and production.

prominent; head comparatively broad and short and not long or crow-shaped; legs set well apart and straight; plumage clean and smooth.

CHICKEN LICE.

To the Editor: Can you give me a remedy for chicken lice?—H. P., Bangor, Cal.

See Rural Press, September 20, 1919, page 402.

MARKET MAN SAYS MOVE MARKETABLE STOCK.

From indications, says a reputable provision man of San Francisco, there will be an immense crop of turkeys throughout California and the Middle West that will not mature until quite late this season, with the result, we believe, that the Christmas season will see the market glutted; therefore, it behooves everybody to move all stock that is in marketable condition to catch the Thanksgiving trade. No matter how much you ship in, there will still be enough for Christmas, so why take a chance on an uncertain market for Christmas when assured good prices for Thanksgiving? Put on each tag the exact contents of the case so that the shipment can be properly checked up.

50 Cents Per Pound

DRESSED WEIGHT

Wanted: 50,000 Head of Fancy Live and Dressed Turkeys
W. C. Price & Co. Phone Kearny 1599. 244-246 Clay St., San Francisco.

We have just sold LIVE TURKEYS for several of our shippers at the highest price Turkeys ever sold for in the State of California, namely 45c per pound. If you have any large, fat, young or old TURKEYS, we would advise you to dress them nicely and ship them to us by express, or express them alive to us IMMEDIATELY. We shall require the above number of TURKEYS to supply our trade with between now and Thanksgiving and Christmas.

Mark and Consign Your Shipment to This Firm.

HONEY, GRAIN, BROOM CORN, GREEN DRIED FRUIT, AND GENERAL
PRODUCE COMMISSION MERCHANTS

Established over forty years in San Francisco.

CONSIGNMENTS AND CORRESPONDENCE SOLICITED. Highest market prices and immediate cash returns guaranteed. Produce handled on consignment or bought outright for spot cash. Send us samples of any produce you have for sale, stating quantity and price. Any parties making us shipments of Dressed or Live TURKEYS or Wool are at liberty to draw on us as an advance upon their shipments 25c per pound and we will remit the balance of your money immediately after receiving your shipment.

We make a specialty of handling wool on consignment. Would advise you to ship us all you have on hand immediately. References: Bank of Italy, San Francisco.

THE HOME CIRCLE

THE LANDING OF THE PILGRIMS.

The breaking waves dashed high
On a stern and rock-bound coast,
And the woods against a stormy sky
Their giant branches tossed.

And the heavy night hung dark
The hills and waters o'er,
When a band of exiles moored their
bark
On the wild New England shore.

Not as the conqueror comes,
They, the true-hearted, came;
Not with the roll of stirring drums,
And the trumpet that sings of fame.

Not as the flying come,
In silence and in fear:
They shook the depths of the desert
gloom
With their hymns of lofty cheer.

Amidst the storm they sang,
And the stars heard, and the sea;
And the sounding aisles of the dim
woods rang
To the anthem of the free!

The ocean eagle soared
From his nest by the white wave's
foam:
And the rocking pines of the forest
roared—
This was their welcome home!

There were men with hoary hair,
Amidst that Pilgrim band;
Why had they come to wither there,
Away from their childhood's land?

There was woman's fearless eye,
Lit by her deep love's truth;
There was manhood's brow serenely
high,
And the fiery heart of youth.

What sought they thus afar?
Bright jewels of the mine?
The wealth of seas, the spoils of
war?—
They sought a faith's pure shrine!

Ay! call it holy ground,
The soil where first they trod:
They have left unstained what there
they found,
Freedom to worship God.

THE SECRET OF THANKSGIVING.

By Fannie Wilder Brown.

Dora was in tears. "I guess if those Pilgrim children had had such a poor time as I have," she said, crowding her reader and number-book into her school-bag so hard that a corner of her number-book pushed through the cloth, "they wouldn't have made any Thanksgiving. Oh, dear; Now I've torn my bag, and I suppose I'll have that to mend this afternoon, instead of going across the yard to play with Lena."

She snatched her coat from the big chair, and her hat from the broad window-shelf, where she had tossed them when she came in from her walk before breakfast. Little Sister Helen's big doll came tumbling to the floor from the coat Helen had wrapped it in, breaking its nose as it struck the floor. With her hat Dora pulled down a small potted rosebush which Auntie May had given her on her birthday. It struck on the doll's head, breaking the pot into fragments, covering the

doll with damp earth. The slender plant stem was bent in the middle so that the upper part lay at right angles to its stalk.

Helen cried: "My dollie is bwoke! My dollie is bwoke!" and ran to pick her up. She stepped on the rosebush, right on a dear little bud Dora had expected would be a blossom on Thanksgiving Day. Dora caught at Helen, just too late to save the bud, pushing her away so roughly that the little girl fell backward, striking her head on the brass fender in front of the fireplace.

"There," cried Dora, "now I guess you'll be more careful."
But Helen lay very still. Her face was white, her eyes shut.

"Wake up," cried Dora. "You mustn't act like that!"

Still Helen did not move. Dora took her hand and tried to pull her up, but the child lay as she had fallen. "Mother!" Dora called. "Mother! Come quick!"

Mother was dusting in the next room. She came in quickly, saw Helen on the floor, took her up into her arms, and hurried with her into the kitchen. "She will be all right in a minute," mother said.

Dora's knees knocked together in so queer a way she could hardly walk. The kitchen looked big and strange, and seemed to be turning around and around, while the sink seemed to stand on the top of a hill.

Mother turned the cold water faucet, caught a handful of water, and dashed it into Helen's face. "Oh," cried Dora, "don't!"

But mother did it again and again. Then Helen gave a little gasp, and her eyes opened.

"She's all right now," said mother, wiping the wet face tenderly and kissing both cheeks and lips. Then she carried her back into the sitting-room, and laid her on the couch.

"Put your coat and hat away, Dora," mother said. "You must stay at home from school today to help take care of Helen. I want her to keep quiet and rest, and you may sing to her and tell her stories."

All day long Dora tended Helen as gently and lovingly as possible. At night, after Helen had been put to bed in her little white-and-gold crib, and Dora lay in her own bed, thinking, thinking, suddenly she burst into tears.

"What is it?" mother asked, coming in with a lamp and gathering Dora up in her arms.

"I'm so sorry I hurt Helen. I did it, mother. I pushed her over. I didn't mean to hurt her, but I was cross."
"What was the trouble?"

"Everything went wrong—things always do go wrong just when I can't bear anything at all!"

Mother gave a queer little smile. "Did you take a pill, Dora?"

"No, mamma," Dora answered. "I forgot all about the pills. Shall I take one now?"

Mother nodded. Dora reached across to the dressing-table and took up a little pill-box. It was marked: "Pills for Dora, when she can't bear anything at all. In mild attacks, take one; in acute illness, take two; if very severe, take three." In the box were left about a dozen tiny rolls of paper, tied with bits of colored silk. Dora chose a "pill" tied with blue. She slipped off the thread, unrolled the paper, and read: "Think of something pleasant that is going to happen."

"But I wish there wasn't any Thanksgiving tomorrow. I've been wishing it all day. It won't make me thankful a bit, I know it won't. I'm just as sad as I can be, and I wish it was a day to cry instead."

"Dear me! This is an acute attack. I think you'd better take another pill."

Dora opened the box again. This time she chose pink. It said, "Count how many things you have to be thankful for."

"But I'm not thankful one bit," said Dora, "and Thanksgiving won't make me be."

Mother looked very sober. "No,

dear, Thanksgiving doesn't make people thankful or happy. That isn't what it is for. It is to give people a chance to show that they are thankful."

"I'm not. I'm puffed up mizzable."
"With a nice school and pretty clothes and playthings and Lena? With home and mother and father

and Helen?"

"But—if I'd been a Pilgrim, with a wild turkey dinner to eat, and a red cloak to wear, and a whole ship load of good things come over from England to them, I'd have been so glad I shouldn't have known what to do. No wonder they made a Thanksgiving! They didn't have to go to school, nor

Your Wife Should Be Considered

Mr. Farm Owner:

You may have fitted up your farms and out-buildings with electric, labor-saving devices, but have you considered the lady of the house?

An electrically driven washer, mangle, vacuum cleaner and other household devices will greatly lessen her work and add to her comfort.

A few words to your lighting company suggesting as a preference G-E MOTORS' will repay you for the trouble.

Ice Cream Freezer

A MOTHER'S "UNION"

Let's start a Union for Mothers and get our mother to join at once. Not a Labor Union, but a Love Union. Everything is to be in perfect harmony so there can be no thought of "strike." We will begin with a profit-sharing system in the shape of shorter hours and more conveniences. How?—Easy. You can begin tomorrow, and it will not cost much either. Suppose by a simple operation you should quickly and easily change the entire heat system—cook-stove and heater—from the slavery of dirty wood and coal to clean, cheap gas—would mother approve of the "Union" and join?—you know she would and forever bless the organizer.

A Dreadnaught Oil-Gas Burner in those same stoves will do wonders for mother—shorten her hours and make all work-time a pleasure instead of drudgery. Incidentally you are going to reap a good big part of the benefits—think it over, Daddy Boy. Let's start that "Mother's Union" right away—Write for our circular that will give you further details.

learn lessons, nor mend torn bags, nor anything!"

"Why, Dora! They had to work harder than you ever thought of working, and without any conveniences to work with, either. There were no stores, and no money to buy things with if there had been stores. They were glad to get the ship's food because they were almost starved. They were thankful because that terrible first winter and the wild animals and the fiercer Indians had not killed them all; and they sang hymns and prayed because they felt that God had taken care of them, and they wanted to show how much they appreciated it."

"I don't believe things went wrong with them as they do with me—and just when I can't bear anything 'specially.'"

"But things don't go wrong, dearie. We break and spill and tear things and hurt people when we let ourselves get cross and worried and sad. It wasn't what the Pilgrims had or didn't have, Dora, that made their Thanksgiving, or what happened to them or didn't happen to them. It was how they felt in their hearts. And that is what will make or spoil our Thanksgiving tomorrow."

Dora kept still for awhile, thinking. "You haven't taken that second pill yet," mother said.

"Well," said Dora, slowly. "I'm glad Helen was not hurt any worse. And I'm thankful I don't live where there are wolves and wild Indians. And I'm thankful we have stores and money to buy things. And—why, I'm thankful for lots of things. Yes, I guess I'm cured. There is Thanksgiving inside of me, after all."

THIS IS THE DAY OF THE CHILD.

The California State Board of Health says that this is the day of the child—particularly of the American child.

With the entry of the United States among the world powers, the importance of the American child has become tremendous.

Nothing in the world today is of greater moment than the development of this child of Liberty.

Upon his shoulders rests the task of perpetuating the ideals upon which the Nation was founded.

It is upon him that we must depend to keep America for the Americans.

Under the new social and political conditions his work will be no gentle pastime.

To make him fit for future responsibilities will require the provision of every attribute that makes for education and for physical well-being.

By giving to the Nation strong, healthy, intelligent children California can best prove her devotion to the principles of Liberty upon which the Nation was founded and can best prove her fealty to the bonds that hold the United States in everlasting union.

Every California child has a right to demand that he be given every opportunity to be healthy. His health is of public as well as private concern.

Potato wart has not yet been discovered in Wisconsin, but plant pathologists are watching for it as the potatoes are harvested. The wart is a spongy overgrowth which starts at the eyes and may cover the whole potato. Rot follows the warts and makes the potatoes worthless. Control of the disease is practically impossible.

CHOCOLATE CAKES.

The chocolate cake oftenest seen and perhaps most generally liked is the layer cake, put together and covered with chocolate. But there is really a wide variety in chocolate layer cakes, and of chocolate cakes in other forms it would be easy to give a dozen reliable recipes. These vary widely in character, from the simplest loaf or cookie, made light with baking powder, to the highly elaborate forms in which rich materials and skilled handling are united.

A hint of this variety is shown in the tried recipes that follow. One may choose a dark cake with white icing, a cake with the double (chocolate cream) icing, or both cake and icing rich and dark with chocolate may be considered better still. Nuts and fruit in either the cake or the filling may vary it still further. The combinations are easily varied, and only individual liking can decide upon the best. A few general directions are worth considering.

Plain cakes require a quick oven; richer cakes a slower one, and the texture of the cake depends upon the baking quite as much as on the mixing. Too cool an oven and too much baking powder, alike, will give a coarse texture. An oven too hot at the beginning causes a cake to rise rapidly and sometimes to fall afterward. For a fine cake a smooth, close-grained, buttery texture is desired. Chocolate helps to thicken cake batter and therefore allows a little less flour; it also takes up a little more butter. In dividing batter for a marbled cake, for instance, it is well to add a bit of butter of the size of a hickory nut to the dark part with the chocolate. Cocoa makes a convenient substitute for chocolate in light cakes. In using chocolate, either in the body of the cake or for filling and icing, the most convenient way is to soften and dissolve over boiling water.

THANKSGIVING DAY.

Thanksgiving Day is a day set aside each year, by the Government, for fasting and prayer, and also for the commemoration of the landing of the Pilgrim Fathers. Because of custom, it always comes upon the last Thursday in November.

The first day of Thanksgiving was observed December 21, 1620. A religious sect known as Pilgrims, because of their wanderings, emigrated to America that they might be free to worship God according to the dictates of their own conscience. After a perilous journey through unknown waters to an unknown land, during which they suffered many hardships because of storms and disease, they were indeed joyous and thankful that they had reached their destination and were now, to some degree, freed from the rigid laws of England. This first day of Thanksgiving was spent in fasting and prayer and the singing of hymns.

GRAPEFRUIT COCKTAIL.

Cut grapefruit in halves, remove each section, saving all the juice; add sliced oranges and bananas in equal quantities, sprinkle with powdered sugar and place in cocktail glasses, topping the fruit maraschino cherries. If the grapefruit shell is used for a receptacle, notch the edges evenly, before placing the fruit in.

Hanes gives wear-service that will exceed any man's expectations!

GET the big, extra-long-service features of Hanes winter men's Union Suits and Shirts and Drawers fixed in your mind! Go over the extra-wear-points brought out in the diagram circles shown in the Union Suit above—*guaranteed* unbreakable seams; *guaranteed* tailored collar that cannot gap; *guaranteed* elastic knit wrists and ankles; *guaranteed* closed crotch; *guaranteed* pearl buttons sewed on to stay; *guaranteed* buttonholes that last as long as the garment!

If comfort, warmth, wear and economy mean much to you in winter underwear, then buy "Hanes"! Every thread, stitch and button is *guaranteed*! You should immediately check up your dealer and get a supply.

Hanes winter weight Union Suits are standard throughout America—standard because they exceed in real worth any underwear you ever bought at the price!

Your confidence in Hanes Underwear should be based on the fact that every process of manufacture from raw long-staple cotton to the perfected garment is under direct Hanes supervision in Hanes factories!

Your choice of Union Suits or Shirts and Drawers is a matter of personal preference.

Union Suits for Boys All the quality, extra features and perfect workmanship that make Hanes men's Union Suits so universally popular go right into Hanes Union Suits for Boys! These staunch Union Suits stand up against the stiffest wear-service and wash service. Made in sizes to meet ages between 2 and 16 years. Two- to four-year sizes have the drop seat.

If your dealer cannot supply you, write us direct

P. H. HANES KNITTING CO., Winston-Salem, N. C. New York Office, 366 Broadway

VAUGHAN & MATTISON,

Pacific Coast Representatives

225 Market Street,

San Francisco, Calif.

SAN FRANCISCO.

San Francisco, November 19, 1919.

BARLEY.

The lateness of the rainy season is holding back the ranges and compelling an increased purchase of feedstuffs. As rolled barley is the favorite for this the price of the whole grain continues to increase. Dealing in futures gives additional strength to barley. December deliveries selling as high as \$3.51 and May \$3.45. It is questionable whether barley can maintain its present prices after the first heavy rains, and certainly not after the ranges begin to show green.

Feed \$3.35 @ 3.45
Shipping \$3.40 @ 3.50

OATS.

Oats are slow and as yet have shown no indication of advancing with barley. There is some demand for black seed and for the uncleaned description from \$3.15 to \$3.25 is the usual price. For re-cleaned for seed there is no agreement on price. It varies from \$3.25 to \$3.90, depending on the condition, amount wanted, and on how badly it is wanted. No accurate quotation is possible.

Red seed, per cth. \$2.85 @ 3.00
Test for seed Nominal
Black for seed \$3.15 @ 3.25
Re-cleaned Red or Black for seed Nominal

CORN.

Corn is steady and unchanged, but if the dry weather continues an advance may be looked for. On the other hand a heavy rain would probably make the prices weaker.

California \$3.00 @ 3.70
Egyptian, choice \$3.30 @ 3.40

HAY.

Receipts of hay during the past week were 1046 tons, compared with 1349 the previous week. Such hay as is arriving by rail in this city is for Government account, to be double compressed for shipment overseas. Owing to the dry weather, which has continued so long the demand in country districts for hay has been very good. This demand and the disinclination of farmers to dispose of their surplus until the rains start the grass has created a firmness throughout the market, which was followed by an advance all along the line.

No. 1 Wheat, or Wheat & Oat \$19.00 @ 23.00
No. 2 Wheat, or Wheat & Oat \$18.00 @ 20.00
Choice Tame Oat Hay \$21.00 @ 24.00
Wild Oat Hay \$17.00 @ 20.00
Barley Hay \$17.00 @ 21.00
No. 1 Alfalfa Hay \$19.00 @ 24.00
Stock Hay \$14.00 @ 17.00
No. 1 Barley Straw, per bale 50 @ 80

FEEDSTUFFS.

The same conditions which have caused the increase in hay and whole barley prices have put considerable strength in feedstuffs. While rolled barley is the only variety to advance so far another week without prospect of a good rain may advance all prices.

Rolled Oats \$3.00 @ 4.00
Rolled Barley \$6.00 @ 6.00
Cracked Corn \$8.00 @ 8.00
Alfalfa Products \$8.00 @ 45.00

POTATOES, ONIONS, ETC.

The potato market is showing increased strength and activity. There has been a general advance in prices with the best demand for the Oregon product. Onions have been slow this week, but advances recently made have been maintained. The market can not be said to be weak for onions, but there has been lack of interest. String beans and peas are nearing the end of their season and are selling at higher prices. Locally grown eggplant is no longer on the market and only a small quantity came in from the southern part of the State.

String Beans, lb. 12 @ 17 1/2 c
Peas, lb. 15 @ 30 c
Carrots, per sack \$1.00 @ 1.25
Cucumbers, box 75c @ 1.00
do, Hothouse \$2.00 @ 2.25
Eggplant Nominal
Lettuce, per crate 75c @ 1.25
Tomatoes, Stone \$1.00 @ 1.25
Hubbard Squash, sack \$1.25 @ 1.50
Pumpkins, sack 75c @ 1.00
Potatoes, River, cwt. \$2.50 @ 2.90
do, Oregon Gem, cwt. \$3.25 @ 3.80
do, Oregon Burbank, cwt. \$3.25 @ 3.40
do, Idaho Gem, cwt. \$3.25 @ 3.40
do, Sweet, new, lb. 3 1/2 @ 3 3/4 c
Onions, Brown, sack \$1.00 @ 1.25
do, Yellow, sack \$3.25 @ 3.75
do, Green, Alameda Nominal
Garlic, lb. 20 @ 25c

BEANS.

There was a good deal more interest in beans this week than for some time past. While it was not sufficient to cause a general advance in prices the new crop beans of Large Whites, Red Mexicans, Pinkas and Bayos sold at higher prices. Some of the old crop Bayos were also sold at 50 cents advance over last week's quotations. The new interest in beans is welcomed by the local dealers.

Variety **Old crop** **New crop**
Bayos \$7.00 @ 7.25 8.00 @ 8.75
Blackeyes \$5.75 @ 6.00 6.00 @ 6.15
Cranberry \$6.00 @ 6.25 7.25 @ 7.75
Pinks \$5.50 @ 5.75 5.90 @ 6.25
Red Mexican \$5.00 @ 5.75 6.25 @ 6.75
Tepary \$2.50 @ 2.75
Garbanzos 9.50 @ 10.00
Large Whites \$5.25 @ 5.50 5.90 @ 6.10
Small Whites \$6.00 @ 6.25 6.00 @ 6.25
Limas \$14.50
do, Baby 13.00

POULTRY.

The bottom dropped out of the market for small broilers this week, the price for the best receding 7 cents. Larger broilers were also weak and lower on lack of demand. Dressed turkeys were weak and the trade seemed determined not to pay more than 45 cents for selected stock. At the same time the price of live turkeys was well maintained. Old geese advanced in price to almost a parity for the young stock on the holiday demand and the fact that young geese are not yet in good condition for the market.

Broilers, 1 1/2 lbs. under 36 @ 40c
do, 2 to 3 lbs. 32 @ 30c
Fries, 2 to 3 lbs. 32 @ 30c
Hens, extra, per lb. 34 @ 35c
do, Leghorns 30 @ 35c
Smooth young roosters, per lb. (3 lbs. and over) 30 @ 32c

THE MARKET REPORTS

Old Roosters, colored, per lb. 22c
Turkeys, dressed, young spring, lb. 40 @ 45c
do, live 38 @ 40c
Geese, young, per lb. 28 @ 30c
do, old, per lb. 26 @ 28c
Squabs, per lb. 60 @ 65c
Ducks, young 28 @ 30c
do, old, per lb. 25 @ 27c
Belgian hares 16 @ 20c
Jack Rabbits \$1.50 @ 3.50

BUTTER.

There was not much activity in the butter market during the past week and extra showed fluctuations of only a half cent. Storage butter and substitutes are being used in increasing amounts, and it seems doubtful if butter will advance to a much higher figure than at present. Last year and the previous year, December averages for butter were approximately four cents higher than the respective November average. But November of last year averaged about 7 cents less than the average of this year, while the average of two years ago was about twenty-five cents less than this year.

Thurs. Fri. Sat. Mon. Tu. Wed.
Extra 64 64 63 63 64 64

EGGS.

Eggs have reacted from the extreme low prices of last year to within 2 1/2 cents of last week's high point. The Eastern markets are very strong. Selected extras selling in New York today at 98c to \$1.00. All other descriptions of eggs showed considerable advance on the New York market today, and these quotations were received after the local

price for the day was made. This would indicate higher prices tomorrow unless an unexpected break occurs in the Eastern markets. The prices of pullets and undersized closed higher in this market, the former being within a cent and the latter within a cent and a half of last week's high. Shipments East from points of production continue.

Thurs. Fri. Sat. Mon. Tu. Wed.

CHEESE.

While there was little activity in the cheese market this week some demand developed for California fancy flats and Y. A. Each description advanced a half cent on the demand. Oregon Y. A. advanced to a parity with the California product.

California Flats, fancy 32c
do, Firsts 27c
Y. A. Fancy 34c
Oregon Triplet 30 1/2 c
do, Y. A. 34c

FRESH FRUITS.

The apple market is rapidly becoming exclusively one for the Oregon descriptions. While there are still some small lots of California bellflowers they have little or no influence in the market. California pippins are in good demand and quantity, and sell at a higher range. Raspberries are now a thing of the past, and while it is expected a case or two may be received from time to time if the rain holds off, their quality is not good

and there is little demand. Strawberries are also becoming scarce, but their quality is good for the season.

Apples, Jonathan, Oregon \$2.50 @ 3.00
do, Spitzenberg, Oregon \$2.50 @ 3.00
do, Bellflower Nominal
do, Pippins, Calif. \$2.50 @ 3.00
do, Oregon, other \$2.00 @ 3.00
Quinces \$1.30 @ 1.50
Pears \$2.00 @ 4.00
Strawberries \$18.00 @ 20.00
Raspberries None
Grapes \$1.50 @ 2.50
Figs \$1.50 @ 2.00

CITRUS FRUITS.

Navel began to arrive a few days ago and they are now in fair quantity along the coast. They sell from \$5 to \$5.50 per box. Valencia's are still in quantity and have been reduced in price to \$4.50 for the best. Grapefruit is coming in in good supply and is selling at lower prices than a week ago. Lemons have been lowered a dollar a box for all varieties on account of general weakness in the citrus market.

Oranges, Valencia's \$4.00 @ 4.50
Lemons, fancy \$6.50 @ 6.00
do, choice \$4.50 @ 5.00
do, standard \$3.50 @ 4.00
Tangerines \$1.50 @ 3.00

DRIED FRUITS.

The dried fruit market was steady this week with no changes in quotations. Local dealers consider the market in good condition and do not look for material changes in the near future.

Apples 17 @ 18c
Pears 16 @ 18 1/2 c
Apricots 21 @ 28c
Prunes 11 @ 13c
Figs, Adriatic 12 @ 18c
do, Calymna 16 @ 21c

HONEY.

Honey felt the effect of the approaching holiday, and while there was no weakening in prices there seemed to be a total lack of interest.

Water White 18 @ 20c
Light Amber (Mountain) 16 @ 18c
do (Alfalfa) 14 @ 16c

RICE.

Rice quotations quiet and unchanged. S-S Siam Usual is quoted at \$10.25 for November and December delivery, while the same description is quoted 15 cents higher for delivery in January and February.

LOS ANGELES.

Los Angeles, November 18, 1919.

BUTTER.

Prices remain unchanged since reported last week. Demand holding up and receipts considerably lighter than a week ago, being 233,900 lbs.

Fresh, California, extra creamery 66c
do, prime first 64c
do, first 63c

EGGS.

Eggs selling very well and the market is quoted lower. Receipts also lighter, for the week, 491 cases.

Fresh ranch, extras 75c
do, case count 75c
do, pullets 62c

POULTRY.

Receipts are light. Broilers and friers in good demand and quoted higher. Heavy hens also selling well. Slow sale on light hens. The market is firm on turkeys and ducks, and a good demand is reported for them. Very dull on geese.

Broilers, 1 to 1 1/2 lbs. 45c
Broilers, 1 1/2 to 1 3/4 lbs. 45c
Friers, 2 to 3 lbs. 35c
Hens 32 @ 36c
Roosters (soft bone), 3 lbs. and up 19c
Stags and old roosters, per lb. 35 @ 37c
Turkeys 25 @ 30c
Ducks 25 @ 30c
Geese 27c

VEGETABLES.

Offerings in this market are lighter. The demand for all choice to fancy fresh is very good. Prices reported are considerably higher than quoted a week ago.

Potatoes, Northern Burbanks \$3.30 @ 3.35
do, Idaho Russets, cwt. \$3.00 @ 3.25
Sweet Potatoes \$2.00 @ 2.25
Onions, Stockton, yellow, cwt. \$3.85 @ 4.00
do, White Globe, cwt. \$3.60 @ 3.75
Cabbage, per 100 lbs. \$1.25 @ 1.50
Lettuce, crate \$2.50 @ 2.75
Rhubarb, per 30-lb. box 90c @ \$1.25
Summer Squash, lug 90c @ \$1.25
Peas, per lb. 12 @ 15c
Kentucky Wonders 15 @ 16c
String Beans, Green 14 @ 18c
Tomatoes, lug box 85 @ 90c
Lima Beans, local, lb. 8 @ 9c
Cucumbers, local, lug box \$2.50 @ 2.75
Watermelons 75c @ \$1.00
Peppers, Bell, lb. 6 @ 8c
Cauliflowers, lb. 1 1/4 @ 1.50
Celery, crate \$3.50 @ 3.75
Cauliflower, crate \$2.00 @ 2.25

FRUITS.

The demand in this market is good for all choice to fancy. Receipts falling off on most everything but apples. Prices are generally higher. Quinces now listed and selling at 3c and 4c the pound.

Grapes, Malaga, lb. 11 @ 12c
do, Tokays 11 @ 12c
Pears, Bartlett, lb. 6 @ 8c
Japanese Persimmons, lb. 5 @ 12c
Apples—Bellflowers, 4 tier \$1.75 @ 1.80
do, Jonathan, packed box \$2.75 @ 3.00
do, Red Permain, packed box \$2.00 @ 2.25
do, White Permain, packed box \$2.00 @ 2.25
do, Yellow Newtown Pippins, pkd box \$2.00 @ 2.25
do, Spitzenburg, packed box \$3.00 @ 3.25
Quinces, lb. 3 @ 4c

BEANS.

Very little doing in this market. All prices the same as quoted last week.

Limas, per cwt. \$12.00
Large white, per cwt. \$4.25
Small white, per cwt. \$4.50
Blackeyes, per cwt. \$5.00 @ 5.25
Tepary, per cwt. \$3.00 @ 3.25
Pink, per cwt. \$6.25

Special Livestock Market Report

San Francisco, November 19, 1919.

CATTLE—The market situation during the past week has changed but little. The continued dry weather is moving some stockmen to part with cattle they would otherwise prefer to keep. The demand continues good for well-finished steers. Range and dairy calves are both in good request.

Steers, No. 1, 1000-1200 lbs. 10 1/2 @ 11c
do, No. 1, 1200-1400 lbs. 10 @ 10 1/2 c
do, 2nd quality 8 1/2 @ 9c
do, thin 6 1/2 @ 7 1/2 c
Cows and Heifers, No. 1 8 1/2 @ 9c
do, 2nd quality 7 @ 7 1/2 c
do, thin 4 1/2 @ 6c
Bulls and Stags, good 5 1/2 @ 6 1/2 c
do, Fair 4 1/2 @ 5 1/2 c
do, Thin 3 1/2 @ 4 1/2 c
Calves, lightweight 11c
do, medium 10c
do, heavy 8 @ 9c

SHEEP—The supply of mutton sheep and lambs about keeps pace with market demand. There is a disposition to keep all suitable stock for breeding purposes. Quotations unchanged.

Lambs, yearling 10c
do, milk 12 @ 12 1/2 c
Sheep, wethers 9 @ 9 1/2 c
do, ewes 8 1/2 @ 7c

HOGS—The recent sudden advance has been checked, as the higher prices brought out freer offerings. The price situation remains the same, though the market is strong.

Hogs, hard, grain-fed, 100 to 150 lbs. 15 1/2 c
do, 150 to 225 lbs. 16c
do, 225 to 300 lbs. 15 1/2 c
do, 300 to 400 14 1/2 c

Los Angeles, November 18, 1919.

CATTLE—Steers in light supply and best in good demand. Prices are firm in this market, and unchanged.

Per cwt. f. o. b. Los Angeles:
Beef steers, 1000 @ 1100 lbs. \$9.50 @ 11.00
Prime cows and heifers \$8.00 @ 9.00
Good cows and heifers \$7.50 @ 8.00
Canners \$5.00 @ 5.50

HOGS—Receipts of hogs falling off and higher under lighter offerings. Demands reported to be very good.

Per cwt. f. o. b. Los Angeles:
Heavy average's 275 @ 350 lbs. \$11.00 @ 12.50
Light \$14.00 @ 16.00
Heavy average's 225 @ 275 lbs. \$13.00 @ 14.00

Special Deciduous Market Report

(Written for Pacific Rural Press by J. L. Nagle.)

Sacramento, Cal., November 17, 1919.

Unfavorable and very cold weather in many of the Eastern markets during the past week, and due to the fact also that many of the offerings contained good and unsound fruit, accounts for the wide range in prices.

The continuing demand for wine grapes, however, cleaned up many markets on stock unsuitable for consumption; in fact, wine grapes outsold fancy stock table grapes. The movement in transit is light and the shipments will probably finish for the State this week.

Almerias from Spain put in their appearance about ten days ago, but there is a wide range in the quality of the fruit, the stock selling from \$1 to \$15 a barrel.

All markets should show a continued active demand on sound arrivals and though quite a

proportion of the fruit in transit is showing the effect of frost damage, this stock should be picked up readily by wine grape buyers at satisfactory prices.

Averages for the week:
CHICAGO:—Emperor Grapes, \$1.94; Cornichon, \$2.24; Zinfandel, \$2.00; Tokays, \$1.78; Malagas, \$2.58; Mission, \$2.15.

NEW YORK:—Malaga Grapes, \$2.38; Tokays, \$1.78; Emperors, \$1.90; Cornichon, \$2.13; Alicante Bouschet, \$2.80; Muscat, \$1.56; Mission, \$2.10; Zinfandel, \$2.05; Winter Nells Pears, \$3.43; P. Barry, \$4.57; E. Beurre, \$3.70.

BOSTON:—Cornichon, \$2.18; Tokays, \$1.05; Emperors, \$2.20; Malagas, \$2.25; Zinfandel, \$1.90; Mission, \$2.30; Muscats, \$1.10; E. Beurre Pears, \$3.80; B. Claireau, \$5.05; Winter Nells, \$4.30; Mission, \$2.60.

Special Citrus Market Report

During the past week the Valencia market has been very much easier. As a result prices in auction centers have lowered \$1 per box, while a decline of 50 cents per box was felt in the private sale markets. This decrease in price is due doubtless to the trade waiting for the early navels, to appear on the market, but with Thanksgiving near there is renewed activity for the Valencia crop. There are probably 1,500 cars of Valencia's remaining for shipment after this week. F. o. b., Cali-

fornia quotations are on a basis of \$4 to \$4.50 on Valencia's.

It is reported that four or five cars of the new navel crop are moving daily from north of the Tehachapi. They are coloring up well.

In spite of the fact that there are approximately 40,000 boxes of foreign lemons on hand, there is also a fair demand for California lemons, on a basis of \$5 to \$4 f. o. b.

The total shipment of cars of oranges for the past week were 417; while there were 92 cars of lemons shipped.

HAY.

Receipts are light but demand is very good for both grain hay and alfalfa. Prices quoted are the same as last.

F. O. B. Los Angeles.

Barley hay, ton	\$22.00@25.00
Wheat hay, ton	\$24.00@26.00
Alfalfa Northern, ton	\$24.00@25.00
Alfalfa local, ton	\$25.00@27.00
Straw	\$10.00@12.00

TURKEYS FOR THANKSGIVING.

(Written for Pacific Rural Press.)

The storage houses are entirely cleaned up on turkeys, leaving the field open for fresh stock. With every dealer competing to get stock to fill his orders, the price of turkeys was run up entirely too high to suit the buying public, with the result that the market has reacted, and turkeys that would bring 50c to 53c in the market last week, are unsalable at 47c today. We refer, of course, only to top stock. In view of the fact that the high prices on turkeys have induced hundreds of new raisers to go into the business, California will produce this year a crop estimated at 50 per cent in advance of any previous year.

On account of a very large production, we do not believe prices will be maintained within 3c to 4c of the present ruling market; for not only are there a greater number of unemployed men in California than ever before, but the fights now being waged against the high cost of living is asking the housewife to think twice before she will put \$5.00 into a turkey for the family. We candidly believe that turkeys will have to be purchased wholesale at a price which will retail to the consumer at not to exceed 50c, which will mean the wholesale jobbing prices around 40c to 42c with, of course, the usual differentials on off-grades.

Pack hens side up; toms breast up in separate cases, and give exact contents of each case, whether toms, hens, fancy or No. 2's.

Ship Thanksgiving stock not later than Monday, November 24th, otherwise you will miss the best market.

CONEJO RANCH HAS CHOICE ONES.

The Conejo Ranch, which is located on the Ventura Highway, 40 miles northwest of Los Angeles, is rapidly taking a prominent place amongst the purebred swine-breeding institutions of the State.

At the San Francisco National Live Stock Show, which has just closed, the Conejo herd captured 10 Championships, 20 Firsts and 19 Seconds, thirds, etc. At this Show the awards included the Reserve Grand Champion boar, in both Duroc and Hampshire classes; also the Junior Champion boar in both breeds. The Conejo exhibit also won Grand Champion sow in the Duroc Division, Reserve Grand Champion sow in both Duroc and Hampshire Divisions, and Senior and Junior Champion sow in the Duroc class; Champion barrow in Hampshire; also First Prize Get of Sire and Produce of Dam in Durocs and Hampshire.

Almost as creditable a winning was made at the Los Angeles Live Stock Show, which was held in October. The Conejo herds captured 35 ribbons, which included Grand Champion Hampshire sow, Senior Champion Hampshire sow, and First Prize Produce of Dam and Get of Sire.

At the Los Angeles Show an exhibit of the Hereford cattle was made, which won seven ribbon awards. This is the first showing ever made by this ranch of Hereford cattle.

SHORTHORN SALE SUPREME.

W. C. Short of Reno, Nev., one of the oldest Shorthorn breeders in the West, has announced his first public sale, putting up at auction at the State Fair Grounds at Sacramento on Tuesday, December 11, fifty-two head of young bulls and females. Short acquired a part ownership in this herd, which was established in the early seventies by A. Banta, in 1898, and became sole owner in 1910. Short has been a good buyer at Shorthorn sales in California and the East, getting the kind of bulls that made his herd one of the best in the great cattle-growing State of Nevada. Col. Ord L. Leachman of

Sacramento, who will handle the sale, just returned from Reno, where he reports the cattle to be in fine shape, although only recently taken off the range. They are all deep red in color.

THE WOOL SITUATION.

At the close of September last there was in the hands of the Government, manufacturers and dealers 729,373,000 lbs. of wool, grease equivalent. These stocks of wool were 8 per cent greater than were held on June 30, 1919, and 50 per cent greater than stock held one year before. At the present rate of consumption it is pointed out that these stocks are sufficient to last for more than a year. The only grade in which there is a shortage is that of fine wool. Boston holds first place among the wool markets of the country, with Philadelphia ranking second and Chicago third. Fine wools are in very urgent demand, and although low-grade wools are lagging, the opinion prevails among traders that an advance in the price of coarse wools can not long be delayed as they must be blended with the finer grades to meet the enormous demand for woolen goods.

RAIN LACKING IN MOUNTAINS.

Our special correspondent reports feed very short in Tuolumne, eastern Stanislaus, eastern Merced, and Mariposa counties, due to lack of rain for the last two seasons. No rain after the last of March for two years. Ranchers and stockmen around La Grange, which is centrally located for this area, who have been up in the mountains, also bring the same report from the Forest Reserve. The stock is correspondingly poor, and probably little or no range beef will be shipped this year. The fall roundup is not complete, due to the fact that the stockmen wish to keep the stock on the forest ranges as long as possible, holding the foothill feed until the first snows.

PRIZE WINNERS SHIPPED TO CHICAGO.

Under the management of Alex McDonald the livestock that won some of the highest awards at the recent show in San Francisco are being sent to Chicago to compete in the International Livestock Show there.

High prices for rice are due to Oriental shortage. Reports from the Philippine Islands are that an embargo has been placed on all exports and a Government importation has been attempted. The Government is handling distribution and fixing retail prices.

There has been an enormous increase in the amount of leather exported from the United States to Great Britain since the cessation of hostilities. Sole leather constitutes the chief item.

Early Baart wheat seems to have proved too vigorous for the rich lands in the Byron tract of Contra Costa county, according to D. L. Schrader.

Jules Melotte

Great Belgian Melotte

Jules Melotte — "The Edison of Europe" — has won for Belgium a world-wide reputation for perfect skimming methods. Belgium, the greatest dairy country — whose farms average less than six acres apiece — saves every atom. Waste is unknown.

Jules Melotte has made more valuable cream separator patents than probably all other inventors together! These wonderful patents, including the Self-Balancing Bowl, he has combined in his great Belgian Melotte Separator. No other separator in the world is like the famous Belgian Melotte!

264 International Prizes

The Melotte has won every important European contest the last sixteen years. It is Europe's — it is the world's — greatest separator. In England, for example, where over a dozen cream separators are made, 55 per cent in use today are Belgian Melottes!

15-Year Guarantee Due to its wonderful Self-Balancing Bowl, its simplicity and great efficiency, the Melotte simple gearing, its sturdy construction, its entire *Guarantee* — a guarantee 100 per cent stronger than that given with any other separator. The Melotte easily gives double the wear and service of any American separator.

NO MONEY DOWN—30 Days' Free Trial—then, if satisfied, only \$7.50 and a few monthly payments—**AND**—the wonderful Belgian Melotte Cream Separator is yours. Write today for catalog—it tells all. Before you buy any separator we want you to **TRY—at our expense**—this prize-winning separator of all Europe. We want you to use it as if it were your own. Put it to every test. Then, after 30 days, return it if you choose. We will pay freight both ways—the trial won't cost you a cent.

No Money Down

Before you pay any money we want you to prove for yourself just what the Melotte will do. Use it for 30 days. See how easily it operates. See how easily it is kept clean and sanitary. Note the simplicity—the durability. **Test the Self-Balancing Bowl!** Learn why the bowl can't vibrate or get out of balance—why it can't remix cream with milk—why it is the recognized world's closest skimming device. Compare Mr. Melotte's great separator with all others. Do this: Get them ALL on trial. Test the Melotte side by side with every other separator. See which works the easiest—which is most profitable—which operates at least expense—which is most sanitary and easiest to clean. Then, take your skim milk to a creamery—let them prove which separator skims the cleanest! We welcome such a test! Mail coupon at once—get full details.

Easiest to Clean

Few plain discs, all alike, go back in bowl in any order. Bowl chamber is

Porcelain Lined

Has smooth, rounded surface — no crevices. Easy to clean as a china plate. Can't rust. One-half less tinware to keep clean.

Easiest to Turn

We guarantee the 600-lb. capacity Melotte turns easier than any other separator of 300-lb. capacity. Bowl spins 25 minutes after you stop cranking unless you apply brake. No other separator needs a brake.

Easy Payments

If, after 30 days' trial, you are convinced — as we know you will be — that Mr. Melotte has the best cream separator on the market; that it will get more cream and bigger profits; that it will wear longer, work easier and give greater satisfaction than any other separator—send only \$7.50. Balance in small monthly payments. **Our easy terms show OUR confidence in the Melotte!** You can pay for it right from your increased profits! Let the Melotte pay for itself while it works for you! Get full particulars. Write or send the coupon at once.

Valuable Books FREE

The Melotte Separator, H. B. Babson, Dept. 4908, 2843 W. 19th St., Chicago

Without obligation or cost to me, send me your book "Profitable Dairying". Also latest Melotte Separator Catalog and details of your free trial, monthly payment, no-money-down offer.

"Profitable Dairying", a valuable 88-page book on dairying, is the work of B. H. Benkenhoff, Wisconsin Dairy School Agricultural College, and K. L. Hatch, Winnebago County Agricultural School, Winneconne, Wis. Contains no advertising. A real, practical, common sense treatise, telling everything about cows and dairying—how to feed and care for dairy cattle—how to make more money out of your cows. Every farmer should have this book. Sent free—**together with our Melotte Catalog** which gives the full story about the Melotte Separator and its inventor, Jules Melotte. Get these books FREE. Mail the coupon NOW!

Made in Belgium

What U.S. Gov't. Says

Vibration of a separator's bowl will quickly cost you more money in cream waste than the price of your separator. U. S. Gov't Bulletin No. 201 says that a perfectly true motion of the bowl is absolutely necessary. The bowl is the vital part of any separator—the part where the cream separation takes place.

Self-Balancing Bowl

Jules Melotte—with his wonderful, patented *self-balancing* bowl—has solved the problem of perfect skimming. The Melotte bowl is the ONLY ball-bearing separator bowl. It CANNOT vibrate. It hangs down from a single ball-bearing, and spins like a top. Can't get out of balance—can't cause currents in the cream—can't remix cream with milk. It is simple—durable—fool proof.

THE PACIFIC RURAL PRESS

SAN FRANCISCO

NOVEMBER 29, 1919.

LOS ANGELES

Fruiting of the Date Palm in California

Written for Pacific Rural Press.

NOW THAT THE DATE PALM has advanced so far into the realm of commercial achievement in the Coachella and Imperial valleys, in the southeast corner of California, that a speaker at the Chico convention anticipated that the new plantings would proceed at the rate of a square mile a year until the cured fruit went out of the State in trainloads, it is interesting to remember that the adaptations of California to the free fruiting of the date palm are not restricted to the district which is now manifesting most enterprise in the development of the date industry. It is interesting also to remember that the establishment of that industry about twenty years ago in the region which now cherishes it, was not a discovery, but was really a stage or phase of development on the basis of earlier demonstrated adaptations; and though this phase is most important industrially and naturally the intensity of application to its requirements has given us by far the most important knowledge of the plant and disclosed original methods in the handling of it and its products, there still remains the fact that the date palm manifested its own acceptance of California conditions more than twenty years before the first palm of the new regime of enterprise was planted in the valleys which are now justly proud of their achievements.

It has always been that way in the development of special industries in California. Individuals in particular localities, who have given strenuous attention to particular products, have conscientiously declared their regions the "homes" of this and that plant which yielded the product upon which they had developed their industry. There is nothing wrong in that for they have domiciled the plant, defined its purpose and attained its commercial success with much insight, invention and enterprise. The only charge we have in mind is a certain narrowness of conception, and we cite that merely to enforce the fact that the resources and adaptations of California are greater and more wide-reaching than any regional man or set of men can possibly be.

Very interesting details might be clustered around the proposition that California is greater and broader than any man's conception of her adaptation to industries. While Southern California was concentrating along citrus lines in the '80's the conclusion was that the central interior regions were not adapted to citrus, because those regions were concentrating on deciduous fruits. Vice versa, the south was proclaimed not adapted to deciduous fruits. During the last thirty years the Sierra foothills and mesas in the central part of the State have developed great citrus productions, and Southern California mountain valleys have developed commercial production of apples, pears and cherries. There are hosts of such demonstrations that popular conceptions have been narrow as the men who made them, while nature has waited patiently for them to expand their ideas and start their industries in broader harmony with the adaptations which California affords. The fact is that California has probably no very best place for anything, but has many places of similar excellence here and there among her various topographies and exposures, and it is up to men to find them. California is still playing a great game of hide-and-seek with her industrial children, and may almost be thought to be laughing

at their pranks of discovery and self-appropriation.

All this preaching has no more relation to narrowness of conception with regard to adaptation to the date than it has to other plants, nor more to do with plants than it has to do with cows and their dairy doings—but we take a text from the date palm because we desire to present a very interesting picture, which brings up to date the history of the plants of which we wrote in these columns in September, 1877, and pictured at that time the product thereof. We are indebted for this picture, which went into the camera last week, to W. R. Nutting, who was not only the pioneer in color-

picturing of California, but since 1887 has been periodically depicting the progress of these palms—thus these plants have been the pets of the writer for forty-two years and of Mr. Nutting for thirty-two years, and both of us have gained the idea that we know something about how date palms behave in California. Possibly, in connection with Mr. Nutting's new picture we may be pardoned for recalling what we wrote so long ago, as it contains that which modern historians most highly esteem, viz.: contemporaneous records of events. This is the story of the plants which are now shown thirty years older than when the account was written in 1889 for "The Vacaville District," the first volume of interpretative color-printing in connection with California fruit-growing:

"The Putah creek region is entitled to fame as the first locality in the United States to produce the date of commerce. There were date palms at the old missions, but no record of their fruiting is found, and other dates have been planted by Americans in Southern California, but had not fruited up to 1877, when clusters of dates were shown at the Mechanics' Fair in San Francisco. These trees are growing on the place of Mrs. S. C. Wolfskill. Another bearing date palm is near the residence of John R. Wolfskill. The two trees shown in the picture are of different sexes; the taller is the male. The smaller palm began bearing fruit in 1877. It was then 15 years old, as the seed, taken from a dried date was planted in 1862. The fruit on the smaller tree is of a red color and becomes ripe and of good flavor. The date palm in fruit is a beautiful sight. The glaucous green pinnate leaves are arched out-

DATE PALM FRUITING FORTY-TWO YEARS AT WINTERS.

The ladder stands against the bearing tree; the taller is staminate. Scene in the pioneer garden of the late John R. Wolfskill. Photo by W. R. Nutting.

ward. Between two of these emerge the bright orange yellow polished fruit stalks, which divide into a spray of slender bright yellow stems a foot or so in length; and thickly set upon these clusters are the coral-red date berries covered with a rich bloom. It is a sight not easily forgotten by a lover of nature, and especially by one reared in a northern zone, the characteristic vegetation of which is so different; and as Mr. Wolfskill says, it is a wonder people in warm sections of the State do not plant more date palms instead of so many fan palms, for they are fully as handsome and graceful, besides the pleasure of seeing and eating their fruit. The success of these beautiful trees in the Winters district is an unimpeachable testimonial to the salubrity of the climate."

Mr. Nutting also has a beautiful picture showing a great armful of ripened dates on one spray grown in Fresno county, where he has extensive plantings of date palms. Thus has Nature extended in California the domicile of this tropical fruit.

PUBLIC INTEREST LEADS.

NOW that one side of the United States Senate would not approve the League of Nations with reservations and the other side would not approve it without them, that peaceful source of discord has been nailed up on the barn door of the national capitol to bleach out a little—in fact, it may stay there to serve as a mark for the political sharpshooters of the presidential campaign of 1920. As that matter is temporarily disposed of, President Wilson will take another try at constructing a peace-league between labor and capital, and in his proclamation calling a new conference he says to the newly chosen delegates:

"It is not expected that you will deal directly with any condition which exists today, but that you may be fortunate enough to find such ways as will avoid the repetition of these deplorable conditions."

And this means that he does not propose to have the conference held up by any contentious element which can see nothing but its own purposes to strike for. He also guards against past disasters by calling out no class gladiators, but only those who can be expected to have only one great end in view, and that is the public interests. He says:

"Guided by the experience of the last conference, I have thought it advisable that in this new body there should be no recognition of distinctive groups, but that all of the new representatives should have concern that our industries may be conducted with such regard for justice and fair dealing that the workman will feel himself induced to put forth his best efforts, that the employer will have an encouraging profit, and that the public will not suffer at the hands of either class."

That is an eminently satisfactory declaration. It covers the agricultural demand that labor shall work loyally for the success of whatever job it enters upon and that the employer shall be content with a fair reward above the costs of production. Agriculture will not insist upon holding its own hand in the game so long as those who are trying to stack the cards against its just interests are also excluded. Agriculture demands justice, equal opportunity and broad patriotism in public affairs, and is willing to take these through the channel of true public interest. In the new conference which will assemble in Washington on December 1, California has two representatives out of a total of seventeen: Herbert Hoover of Palo Alto and H. M. Robinson of Pasadena. Agriculture has two: President Thompson of Ohio Agricultural College, and President H. J. Waters of Kansas Agricultural College. Of course, the point might be urged that these parties are a shade too academic, but they are both broad-minded and specifically well-informed, and as only professional men are to sit in the new game, agriculture will take its chances of a square deal on the basis of the highest public interests in industrial peace. We have a trustful expectation that something of great value will issue from the new conference.

THE CENSUS OF 1920.

It is very interesting that we are on the threshold of a new census of the United States. The figures

of the census of 1910 are worn to a frazzle, and though they represent nothing of the present day they are still being repeated in current statistical volumes because there is nothing with a shadow of authority to take their places. This is, of course, unfortunate. It is not as bad as it used to be because the United States Census office is now in continual operation instead of being dusted out and set in motion once in a decade, as was the old way. This new arrangement has given us new statistics at more recent dates in certain special lines of production and manufacture, and they are very valuable, but in the fundamental lines of population, basic agriculture, etc., we are still away behind the times. Arrangement for co-operation between the United States and the individual states, to secure half-decade enumerations, are widely inoperative because the states do not do their parts. California, for instance, has never provided anything but a dribble for authoritative figures, and the best our State Statistician, Mr. Robertson, has been able to do is to rake up and print a collection of figures from national bureaus, class journals and other statistical dust-heaps instead of undertaking original enumerations which would do the state some credit and give our students of economics and humanities something juicy to squeeze out for popular edification and instruction.

Of course, such complaint is not timely nor warranted at this time because next year the new figures will be gathered, and yet, when we get fresh figures we might remember and resolve to always have them fresh and never fall again into the figurative desolation of the last decade. What we desire now to emphasize is the fact that the census of 1920 will be begun in January and not in July as heretofore. In the matter of statistics of agriculture this change in the start is very important. All figures will be of the crops, plantations and conditions of the year 1919—just as the last census had to do with 1909 and not 1910, the census year. To tackle the farmers for figures of the previous year while they were busy with and filled with the facts of the year after, was a foolish piece of business. According to the new plan of enumeration in January, farmers will have time for figuring and will not be confused by fresher facts. Of course, it may be less significant in California, where there is something doing every minute, than in states where a closed-in winter gives farmers nothing much to do but to fodder the stock, and yet even here there is more time and fresher memory for the facts of a preceding year in January than in the following July. Let our readers remember then that the census enumerators will be after them next January, and all the facts of their operations of 1919 will be called for. When you get rained in, as you soon will, figure out your crops, plantations, prices gained, wages paid, etc., for the year which is now closing, and be ready for Uncle Sam's enumerators next January.

ARMOUR AND THE CO-OPERATORS.

It clearly caused a tremor to pass over the assembly at the Chico convention when the representative of the association of co-operative canneries announced that the officers thereof had entered into a contract with the Armours to act for ten years as distributors of their products. It is not remarkable that a growers' co-operative association, combining for a decade with a concern commonly regarded as a trust, should cause the sensibilities of the growers' convention to receive a slight shock, for is it not the current conviction among those favoring co-operative action by producers that they were organizing to place their products upon the open market in such a way that commercial aggression and combination could not avail against them? It was the claim of the representative of the co-operative canners that their arrangement with Armour was merely a practical way of disposing of their product profitably to which it was obviously necessary for them to do if they were to continue to co-operate in manufacture; that it was a movement to promote direct trade and eliminate a host of middlemen because the Armours had their own direct distribution to hundreds of retailers in all parts of the country and thus dispensed with an army of jobbers and wholesalers who were all taking their profits from the business, and while thus

simplifying trade and reducing the number of participating profiteers, they could also reduce the exactions of these and other intervening agencies in securing the adequate advances which continuation of packing by producers required. The goods go into the distributing hands of the Armours at prices which bear relation to the prices of the California Packing Co-operation, which are apparently accepted as a standard of current market values. The representative of the co-operative canners was quite confident that they had made a very fortunate arrangement for the distribution of their product and one which would prove of great advantage to the growers who have invested in establishments to give their products imperishable and acceptable commercial forms.

Whether this move of the co-operators was wise and right we are not now pretending to judge—nor to either praise or condemn. The time for that may come later. But we may say that the operation must naturally excite apprehension until some things about it are demonstrated. Does it forfeit the rights of producers in disposing of their products themselves, to turn their products over en masse to a concern which is reputed to be organized for the purpose of controlling and restraining trade? In this instance, have the producers fallen into good company or bad, and will the courts adjudge them to have forfeited producers' co-operative rights by selecting such a distributing agency? We hope we have stated the facts of their transaction correctly, so that our readers may proceed to fairly consider the influences and relations of the facts. This is all that we have in mind to do at this time.

"CALIFORNIA FRUITS": \$3 NOT \$5.

Referring to the announcement in the Rural Press of November 15, that the price of the new edition of "California Fruits and How to Grow Them" was \$5, we remark that the printer who made that mistake must be pardoned, because he was the victim of unconscious cerebration—induced by the fact that a raise in price was seriously considered. We were advised by other publishers that with present prices of labor and materials, the book could not be brought out at the old price and handled as heretofore. We considered this friendly advice carefully, but concluded that we would attempt what they said was impossible—even at some risk to our own affairs. For the purpose in the publication of this book has never been to make money, and we did not propose to interfere with the attainment of its greater aims by refusing to risk losing a little money. Two chief ends were in view at the first construction of the book in 1889, viz.: first, to contribute to the development of the fruit industries of California; and, second, to afford a source of elementary information about methods so that the Pacific Rural Press need not serve always as a pomological "primer"; but while constantly serving as a faithful guide to beginners, as they might call for such help, it would have space to continuously treat of advanced problems and thus keep those experienced in details constantly going forward into improvement of practice and into organization for profitable distribution of products and for protection of producers against aggression by self-seeking commercial interests. It is not too much to claim that both of these original purposes have been attained and progressively maintained. More than twenty thousand copies of the book have been placed in the hands of growers, and have served for consultation about details of methods for the last thirty years and during all that time the Pacific Rural Press has been regarded by growers as a faithful ally in all efforts to secure progressive development. We could not, therefore, think of raising the price of the book and making it less attainable by those who would be helped by it—that is, beginners in fruit growing, who often have to count their dollars very closely in getting a start with land and trees; nor could we limit the scope of the Rural Press for discussion of advanced considerations by constant re-iteration of elementary details which the book conveys. Therefore, we concluded that "California Fruits" should go at the old price: it was the only way we could win our war for the fruit industry. We say, then, to all who need the help of the book; take it at \$3 per copy,

and with the extra money which the printer's error tried to exact from you, plant three or four more trees and thus recover your investment in it.

CANNOT LOWER PRICES WITH HIGH WAGES.

The National Grange has certainly declared the agricultural situation in no uncertain language—as we pointed out in one respect last week. In another matter, that is, the relation of cost of production to the price of food products, it is no less frank and emphatic. At its session in Grand Rapids, Michigan, on November 29, it adopted this resolution:

"The farmer cannot be held responsible for increase in the cost of living that will result from increased wages and shorter working hours in industry. If industrial wages are increased and hours of labor decreased, the changes will influence farm wages and hours of farm labor in the same way and still further decrease farm production and increase farm costs."

That is, of course, true as far as it goes, but it is by no means, all of it because the farmer is hit not only by the direct increase of farm wages, but he is hit again and perhaps even harder, indirectly, by the increase in prices of all machinery and supplies which he has to buy. One of our readers sends us a note calling our attention to this fact, as follows:

To the Editor: What are Gompers and his Union agitators doing for the farmer? Well, they are urging the farmer to raise more food and doing everything in their power to bring the price of farm products down. At the same time they are trying their utmost to still further increase factory wages and to reduce production in the factory by cutting down the hours of work, both of which increase the price on all factory-made articles that the farmer must buy, and drain the farm of its needed help by the lure of shorter hours and higher wages in the factory. Should Mr. Gompers get the factories unionized he will then pay his respects good and proper to the farmer. Mr. Farmer, will you take heed while you may?—W. H. L., Louisville.

Here, then, we have the situation from two angles: the declaration of a national association of farmers and the suggestion of the manufacturers that farmers should take heed. Our judgment is that the farmers are understanding which way the cat will jump.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Earth-Closet Fertilizer.

To the Editor: Would the contents of a patent toilet (no chemicals used) be beneficial or injurious to walnut trees—buried close around them as a fertilizer? What would be the effect on a young family orchard?—H. L., Concord.

This is what the French call "poudrette," and they use it largely. It is a strong fertilizer and should be covered in a furrow or long trench—scattering it thinly and not burying it in a mass. It should not be applied too closely to any tree, but placed in the open spaces away from the trees.

Transplanting Walnut Trees.

To the Editor: Is it practicable to transplant three- and four-old Franquette walnut trees? I have several mixed in my apricot orchard and I would like to put them along the front. If so, kindly advise how to proceed.—C. E., Eunnyvale.

Yes; if the trees have made moderate growth and have matured their wood well. It used to be held that such trees were better for transplanting than younger ones. Dig carefully and get what lateral roots you can conveniently and dig a large hole to spread them well. Cut back the top considerably, cutting to laterals and covering the cuts with thick paint or asphaltum. Transplant when the soil is not likely to be water-soaked—say, in February; earlier, if your soil is light and well-drained. Help them along with some water through the first summer.

Rotation to Kill Water-Grass.

To the Editor: I have land north of Sacramento, on which this year I have taken off the second crop of rice. The land, this year, had considerable water grass. Immediately after harvesting I plowed the land, and want to plant Gyp corn about May 1st. Will the land slack out enough between now and the first of May to get a good crop of Gyp corn? In the fall, after taking off the Gyp corn, I intend to

plow the land and get it ready for rice the following spring. Will that give the land time enough to slack out? What do you think of this procedure as a means of cleaning up the water grass and at the same time getting something off the land?—A. J. D., San Francisco.

It is always a question how soon water-soaked and unaerated land will give a crop. The heavier and most putty-like it is the slower it is to come into condition. We would help the land to air itself and to get rid of much foul stuff by disking it lightly two or three times during the winter—whenever there is a good weed growth to get rid of. You may get a lot of gyp corn, and if you do it would indicate that you might get a crop of barley hay during the winter of 1921 if you can clear off and plow after the gyp crop by September so as to give about three months for the rubbish to rot before seeding the barley toward the end of December. We have given you a pretty close schedule, but it will work if you keep on time and the land is of a responsive kind.

Melilotus Without Plowing.

To the Editor: Do you think that sowing inoculated Melilotus alba on top of the ground, which has not been plowed or broken up for ten years, will produce a suitable growth?—W. N. Y., Bird's Landing.

On a sandy soil with abundant, continuous moisture, you might expect a good catch of melilotus without plowing. We have seen a good stand of it on an apparently dry sand of a river bar where the stream planted and covered it until the plants started and then the roots chased the water down. You could imitate this by sowing and harrowing the sand—if you started early and the rains come at short intervals. But we should hesitate to put our money in seed at current prices and take so many risks of not getting it back. Besides, if we paid extra money to get inoculated seed (which seems reasonable for such long, unused land), we should try to give it a better chance to grow. Bacteria are very apt to lose vitality and such exposure as might result from broadcasting on unstirred land would be a hard test for it. Bacteria do not multiply on the seed to great extent. They multiply in the soil and are put on the seed only to easily get them into the soil near the seed. For both the seed and the germs we should try to do better farming.

Bridge-Grafting Root-Cavity.

To the Editor: I have a nine-year-old walnut tree which was infected with crown gall. Chiseling away the infected wood leaves a concave depression about two inches deep at the deepest part, and extending two-thirds the way around the trunk—the depression covering about one square foot of surface. Is there any material that I can use to fill up this cavity flush with the surface and then bridge it by grafting back in order to close the space as quickly as possible?—E. S., Hemet.

Paint the wound with Bordeaux mixture and fill with Portland cement even with the under surface of the root-bark. When it is hard, cut walnut scions of two-year-old wood small enough so you can bend them. Cut them a little longer than the wound, with a slope on each end on the same side. Lift the healthy bark a little above and below and spring in the scions with their end slopes under the bark and against the wood surface of the root and cover with earth to prevent drying. This is bridge-grafting, and if carefully done is very successful, because such scions carry sap readily. If you have an idea of bark-grafting by fitting a plate of bark over the filling of the cavity, we advise you to forget it. It is not the whole bark which carries sap to make tissue connections; it is only the inner bark in a very thin layer. The best way to connect with that is by means of scions set as described.

Legumes with Grain.

To the Editor: If I sow 30 pounds of wheat and 30 lbs. of Canadian field peas, treated with bacteria, will I get a larger yield than if I sowed wheat alone?—S. T., Byron.

If you are counting on more wheat than by using a larger seeding of wheat, you will be disappointed. If you are counting on a larger yield of both peas and wheat together, you may get it if there is spring moisture enough to keep both plants going well to the ripening time. Addition of bacteria will help the peas unless the land has already grown beans, peas, or wild clovers. If the land has already plenty of bacteria naturally (as it shows by the

growth of these plants), you do not need to buy more of them. It will help a grain plant to have a legume plant growing with it—if there is moisture enough for both and bacteria enough for the latter.

Subsoiling and Fruit Setting.

To the Editor: I am subsoiling an old peach orchard both ways, to a depth of sixteen to eighteen inches—running three furrows to a tree row. The trees are set twenty-four feet apart on the square, and I am not running nearer than eight feet from the trees. What will be the general effect on the trees, in your opinion? Is there any foundation for the theory that the resulting root pruning will have a favorable effect on the setting of the fruit buds.—F. G. W., Red Bluff.

The subsoiling will admit water freely to the lower strata of the soil, and if the soil is heavy and does not take moisture rapidly enough to prevent loss by surface run-off, or if it has been hardpanned by a long course of working at a certain depth, the subsoil will help the trees. Root-pruning is influential in checking the wood growth of young trees or of older trees growing on very rich soil and turning such trees to larger fruiting. We know of no advantage in root-pruning old trees which you are trying to give a new lease of life and bearing. We should trust to top-pruning, water and fertilizers to do that.

Walnuts and Almonds.

To the Editor: I have light, sandy soil on which I intend to plant seedling Franquette walnuts, 40 feet apart. Between the walnuts I want to put in almonds, to be pulled out when the walnuts are bearing well and need the room. What is your idea of this, and what would be the best almond to plant for quick bearing and good marketable quality?—L. N., Spyrock, Mendocino county.

The plan is a good one where local conditions suit both nuts. For walnuts you should be sure that your sandy soil has substance enough to grow trees and that it will retain moisture enough to grow walnuts, or you can give it enough by irrigation. For walnuts you must know that the tree will bear in your northwest coast district and will not lose too many crops by spring frosts to make the trees profitable. If you are sure of this by the behavior of earlier plantings, go ahead. Probably Drake and Languedoc would be the best to plant because of rather late blooming and their action as inter-pollenizers.

Cutting Back Eucalyptus.

To the Editor: When is the best time to trim old eucalyptus trees that have grown very tall?—R. V. V., Suisun.

Theoretically, the best time to cut back a eucalyptus or any other evergreen is a little in advance of the beginning of a new-growth period—because the old foliage has largely finished its duty to the tree, and because the start of new growth prevents die-back and heals wounds. But in the case of eucalyptus one does not have to pay much attention to such fine compensations. The tree is so hardy and resolute that you can top off anything you desire whenever it is handy for you to do it.

Self-Firing Hay.

To the Editor: Will you kindly advise me if there is any danger of a barn catching fire by putting in hay that is not thoroughly cured and getting hot? Did you ever hear of a barn burning from that cause? If so, was it proven beyond all doubts?—W. J. S., Tracy.

We have never seen a barn burn, but we have seen plenty of browned hay that would not hold the fork, and which it is reasonable to believe would have burst into flames if it had received air enough to promote combustion. It is our judgment that the common impression that barns do burn by catching fire from fermentation of wet hay is correct.

CALIFORNIA WEATHER RECORD

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending November 25, 1919.

	Part	Rainfall		Temperature	
		Seasonal	Normal		
Eureka.....	.14	3.50	8.33	58	40

Saving Labor Making Money with Alfalfa

Written for Pacific Rural Press by R. E. Hodges.

MONTEREY COUNTY has a thriving dairy industry, based chiefly on three market outlets, butter, condensed milk, and cheese. The dairymen are in almost every case well-to-do and pretty well satisfied with conditions. The chief dairy center is Gonzales, which is surrounded by miles of alfalfa fields. Here is located the Alpine condensary, to which milk is hauled by motor truck from as far up the valley as Greenfield, King City, and San Ardo, nearly 50 miles away.

These dairymen have made money, not only on account of favorable prices for their dairy products, but also because they have reduced the cost of production by reducing the amount of labor required to feed their cows. It is regrettable that they do not pay more attention to balancing the feed and thus obtaining more from their alfalfa, but that is another story. This article is concerned chiefly with labor-saving methods of handling alfalfa.

Only one rancher could we locate or learn about who is raising alfalfa to sell. Practically the entire acreage is grown as part of the dairy ranching and most of this alfalfa is never touched by the hand or implements of man.

Hundreds of dairymen pasture the most of their alfalfa from about the first of April until the first of November. For feed in winter months, some of them cut hay and pasture the fields alternately; while others reserve certain fields for hay, and pasture the rest throughout the season. Some buy barley hay from their grain-growing neighbors who surround the district. This is the best practice, for barley hay helps balance the alfalfa.

A good example of successful pasturing of alfalfa may be seen on the ranch of Healion Bros., who milk five strings of cows and keep about 75 head of young and dry stock all on 150 acres including about ten acres, for buildings and barnyards. They sell nothing but milk—about 3400 pounds per day—and they buy nothing but 25 or 30 tons of barley hay per year and outside pasture for dry stock sometimes in the spring.

"To cut alfalfa and feed it to a herd like ours would require three additional men and would yield not over 70 per cent as much milk," says W. F. Healion, who has had ten years or more of dairying experience. He gives credit for the present success of the ranch to his milkers. "These Swiss sure know how to get the milk out of alfalfa," says he.

About 30 acres are cut six times a season for hay. This is used through the winter and for a morning feed when alfalfa pasture is particularly lush. Haying is a continuous operation performed by the milkers.

Systematic Pasturing Day and Night.

The other 110 acres are divided into seven fenced fields of ten to fifteen acres each. The size of the fields should be smaller for smaller herds.

When the growth is of medium height the cows are given a good feed of dry hay and the entire herd is turned onto one field with one man to watch them. After a few days the tops of the alfalfa have been grazed off, the herd is put on the next field for day pasture, and is kept on the grazed field during nights without a watchman. Care is necessary not to leave the night pastures too rich. After a few nights the cows are put on newer stubble and dry stock finishes what is too poor for milk production. The cycle of pasturing each field lasts about a week; but the cows get onto new day pastures every three or four days, so seven fields keep them going nicely. It is necessary to fence the fields in order to get them grazed off evenly.

Aged Stands of Alfalfa.

Pasturing the alfalfa in this way seems to benefit it. Good stands seven years old are common. Manure is spread where it will do most good. It is not spread by fork or by machine. Cows are kept off the fields while they are frosty, for damaged alfalfa could be seen afterwards if anything walked through it then. It is all right after the sun comes out. No attention is paid to dew, but no pasturing is done while the soil is wet, on account of damage to the alfalfa. The soil is dark sediment mixed more

or less with decomposed granite from the hills.

Bloating Minimized.

Damage to the cows will be uppermost in the mind of every reader of this article. Healion Bros. had considerable trouble with bloat when they started at Gonzales and they tried all kinds of "cures." Last season they lost none and only had to stick one. This season they had more trouble due to several changes in herdsmen who did not know the cows. Most of the trouble comes from misjudging the richness of night pastures. Trouble is minimized by feeding plenty of hay before turning the cows onto soft new alfalfa. Then, after 1½ or 2 hours the cows will lie down quietly without having over-eaten. The herdsman watches; and if a cow shows signs of bloating, he drives her to the "bloat corral." The rest are left on the pasture, because if they were driven off they would get hungry and would be more likely to over-eat if turned back on the alfalfa. Meanwhile milk production would be reduced.

"Bloat Corral."

The "bloat corral" is a singular institution, as successful as it is simple, a project worked out by the Swissmen. It consists of three or four stalls separated by poles and with a stick across the rear of each. Its distinctive feature is that its front end is piled up with dirt so that a cow standing in it has her front feet 18 to 24 inches higher than her rear ones. Within 15 minutes she will be worse or better. In most cases she will belch gas and the pressure is then pretty sure to go down gradually. If she does not belch, but seems to be making more gas, the attendant sticks her when she shows considerable distress, but before she falls down.

Slight Variations.

A. E. Reinhold carries out a similar plan of alfalfa pasturage, but does not feed hay during the summer nor does he keep a man with the cattle all the time. Two or three inspections per day are given. He has more loss from bloat probably than Healion Bros.;

but this always occurs during the night or in the morning, never in the afternoon. This is considered due to greediness of the cows in the mornings. His fields are cut into lots of 15 to 20 acres each for about the same number of cows Healion Bros. keep.

Likes Weeds in Alfalfa.

John Foletta of the Coburn district near King City pastures a crop of alfalfa between cuttings for hay. He emphasizes the fact that Russian thistles make prime cattle pasture while they are young in the spring and foxtail makes fine winter pasture. His soil is sediment and he too avoids pasturing when it is wet. Most of his alfalfa is pastured during the growing season.

The Only Alfalfa Hay Grower.

The only alfalfa grower we found who doesn't pasture his crop is G. C. Boysen. He kept about 80 milk cows until two years ago when the labor situation led him to sell practically all of the stock.

Since then he has turned all his alfalfa into hay, which is sold in the shock and paid for when hauled over the scales. This yields, at seven years of age, about eight tons per acre average for the 150 acres, according to Mr. Boysen. Last spring he sold the entire season's crops at \$12 to \$14 per ton. Next season each cutting will be priced when it is sold, for Mr. Boysen would have enjoyed the higher prices that prevailed this fall. Already over 600 tons of next year's crop are sold, to be paid for at current market prices when cured.

Less Labor with Hay Than with Cows.

Cutting the alfalfa for hay requires an irrigator and two men besides Mr. Boysen himself. If he were milking five strings of cows, it would require at least five or six men besides himself. So, while the dairymen are saving labor by pasturing their alfalfa, Mr. Boysen is saving still more labor by cutting his for hay. Of course, he is not making as much money as the dairymen; and a time may come when he will wish he had cows to make use of his hay; and then he may find cows as hard to get as hay may be hard to sell.

Chemical Fire Extinguishers Save Grain

Written for Pacific Rural Press by M. B. Pratt, Deputy State Forester.

Three years ago the use of chemical fire extinguishers in combating grain field fires was unknown. In the past summer rural fire companies, organized through the efforts of the State Forester's office, aided by the Farm Bureau, Chambers of Commerce and county supervisors, have prevented with the aid of fire extinguishers the destruction of thousands of dollars worth of grain, hay and pasture.

Fire prevention and fire protection in rural districts is a matter of growing importance. "Why grow grain to burn?" asks the farmer. For this reason the story of how extinguishers came to be used in fighting grain field fires and an account of how the company that has used them the longest handles a fire may boost the good work along.

The moon, rising fire-red from out the summer haze that o'erhung the broad acres of ripening grain in the Sacramento Valley, shot fear into the heart of Oscar C. Schultze, prominent merchant of Dixon, Solano county, one evening in 1917. The war was on. Each paper and magazine published the slogan, "Food will win the war." The moon, through the haze, appeared a great fire, threatening to destroy thousands of acres of needed food.

That night the merchant conceived the idea of using chemical fire extinguishers to fight grain field fires. The next day he experimented with the result that he equipped one of his delivery trucks with several extinguishers, buckets, rakes and shovels

Extinguishers ready for use in fighting grain field fires in Solano county.

and announced his readiness to answer fire calls. Such effective work was done from the start that the attention of the State Forester's office was attracted and adopted the plan. Thus the idea was spread with the result that in 1919 thousands of dollars worth of grain was saved from destruction.

The Dixon merchant continues to make fire-fighting an important part of his summer work. A glance at the record of his company in 1919, the third season of its existence, is most inspiring. Twenty-two fires occurred during the summer months within a radius of nine miles of Dixon. Despite the large number of fires the loss was held to less than \$10,000. Farmers of the district declare the loss would have been ten times as great under the old system.

In combating twenty-two fires 590 extinguisher charges were used. At the rate of 50 cents each, the cost for

charges was \$295. Add to this the cost of operating the fire truck, the value of the time of fire-fighters, allowing liberally for both, and compare this cost with the estimated saving of \$100,000. It will be seen the fire company is paying big dividends to the farmers benefited and to the whole community.

One of the greatest savings through this system of fire-fighting is in the fact that back-firing is unnecessary. Back-firing a grain field always costs money.

Three seasons' experience at Dixon has developed a working plan that may be of benefit to other fire companies. Twelve 2½-gallon fire extinguishers are kept in a rack, on the floor of the fire truck, ready for immediate action. Arriving at the fire one or two men are detailed to the work of supplying water; one man mixes the soda and recharges the emptied extinguishers. On the fire

line two men, with extinguishers, walk a few paces apart directing the stream from the extinguishers at the base of the fire. Behind them come men with rakes to rake out whatever fire patches escape the chemical. Other men with loaded extinguishers are ready to step in as soon as extinguishers are emptied. Thus eight or ten men put out a fire as fast as they can walk.

While this is a plan for an organized fire company, individual farmers can do much to decrease fire loss by adopting precautionary measures. Each farmer, for his own protection, should have fire-fighting equipment ready at all times, especially during the dry summer months.

A newly enacted State law, that became effective July 22, provides that combined harvesters, headers, stationary threshing machines, hay-baling presses, while in operation, must be equipped with two suitable fire extinguishers of not less than 2½-gallon capacity, ready for immediate use.

Since a large percentage of grain fires during the past summer resulted from back fire, burning carbon and sparks from tractors and trucks, the individual farmer can do much in the line of fire prevention. The new law provides that farm engines must be equipped with effective spark arresting and burning carbon-arresting devices.

Fire losses affect the economic conditions of the entire country. They affect everybody individually. They boost the high cost of living.

To Prune and Apricot Ass'n Members

(Written for Pacific Rural Press by R. E. Hodges.)

"If every prune grower were just like me, where in the world would our profits be?"

Imagine the Santa Clara Valley without the California Prune and Apricot Growers, Inc. Wonder where you would sell your 1920 apricots and prunes. Pinch your pocket-book in contemplation of the event. Figure out who would be responsible.

If the growers' organization dies for lack of a controlling proportion of the crop, the growers can compliment themselves for their own consummate asininity. The time to kick the packers is past. Regardless of what the packers did when there was no organization, they are better actors now. The greatest proportion of them have been eliminated and the few who are left are responsible parties in business to stay. You would fight for your business as they are doing if you were as much alive as they are.

Don't Be a Dead One.

Get busy on your own business. It will get your farther. You have neighbors out of the Association. Get them in. They also are human beings. They have reasons that have heretofore kept them out. Probably those reasons are selfish. Your reason for being in the Association is selfish. It is properly so. Show your neighbors good reasons for joining. Get busy to assure safety for your own investment.

You can't get a man to join your company by calling him a scoundrel. You and your organization's representatives have weakened yourselves by antagonizing outside growers foolishly and needlessly. Bear in mind that your object is to get them in. Think of that when you are tempted to get sore. Don't spoil your chances by calling the outsider a fool. He may be one, but he won't care for your company if you tell him too roughly.

Outsiders Would Be Surprised.

An outsider recently went to borrow something from a neighbor who is a member of the Association. When he left, he invited the neighbor's family to come over and visit his own. The neighbor did not say to his face, but he said to another neighbor that he came near telling the outsider that he did not care to cultivate the acquaintance of anyone he considered his enemy. This member, and a large proportion of other members feel that any grower who does not support the Association weakens it and is therefore his enemy. When members' pocket-books and property and living conditions are endangered by their neighbors, they feel it keenly. The growers who weaken the association by staying out of it had better have good reasons for doing so. They would be surprised if they knew the public contempt that is rightly or wrongly held against them. Some of the outsiders have good reasons. Most of them have reasons that could be overcome by proper argument and management; but none of them care to be bulldozed. "A man convinced against his will is of the same opinion still."

It is for you members of the Prune and Apricot Growers' Association to find out the reasons why your neighbors are out and remove those which are removable. Meet the outsiders on a conciliatory basis. Don't surrender essential principles; don't promise impossible accomplishments; don't bulldoze them. The end justifies all fair means; but unfair means will defeat the end.

We hold these truths to be self-evident:

Growers Should Control.

A fruit growers' organization should be controlled exclusively by those who make their living by growing fruit.

Growers cannot take the time to investigate and market their own products.

It has proved necessary for growers to employ experts at packing and marketing and accounting to handle those phases of their business.

It is absolutely necessary that those employed experts be constantly sub-

ject to the supervision of growers' bonafide representatives; and that the growers be kept thoroughly informed as to the conduct of their own business.

When that situation is realized the greatest argument against the present organization will have been knocked out.

Are Benefits or Suspicious Strongest?

The writer has made a special effort to learn the reasons offered by outsiders for not coming in. We are not admitting the validity or accuracy of the reasons given; but we feel sure that members of the association seeking to influence their outside neighbors to join, cannot afford to ignore the statements made. We cannot affirm or deny the accusations because we have repeatedly been refused the most elementary information from the Association (on the ground that its publication would furnish ammunition to enemies of the organization).

It may be good strategy to deprive both sides of ammunition and thus bring about bloodless wars, but in this case the seeds of suspicion are assiduously cultivated.

Charges of graft, incompetency, treachery, etc., are not in the province of this journal to investigate, but where such charges are made, it is the province of members of the Association to have them cleared up, very promptly.

Is It Dangerous to Join?

Meanwhile, the Association has three years' records of splendid service to the entire community, including its supporters and its enemies. If there has been any graft or incompetency in the management, the benefits have so far outweighed the damages that we have not found a man in the Valley who would like to see the Association put out of business (as its directors have threatened unless 26,000 acres additional are signed up).

Large independent growers have assured us that they will not permit the Association to die for lack of acreage. A representative of one of the largest packing interests is equally earnest in desiring the Association to continue as a strong factor in the prune and apricot business, although he is bitter against its present management. Most members (and many outsiders who sold early at prices which seemed enormous but which proved lower than Association prices) are fervent in favor of continuance of the organization. Where such unanimity as to its value exists, there can be but little reason for withholding membership for fear of graft, incompetency, or treachery, especially since such mismanagement can be corrected more effectively from within the organization than from without, and since the apparent accomplishments of the Association have proved that membership in it is no disaster to any grower.

MARIPOSA GROWERS PACK OWN APPLES.

This is the first year that apples have been packed on the ranches in the mountain districts of Mariposa county east of Coulterville and Mariposa, before hauling them to markets. Some of the growers this year solved the shock problem by contracting with neighbors who had small sawmills. Many varieties are grown, but they all have either high color or flavor with punch, or both.

PEACH BLIGHT — SHOT-HOLE FUNGUS.

November is the last month for the first spray to prevent shot-hole fungus, which injures the crop on almonds, prunes, apricots, etc., and causes peach blight, from which many growers suffer every year. Later spraying means crops reduced or lost. Use Bordeaux mixture now.

"Well-begun is half done," applies particularly to grain raising—a good seedbed.

SULPHUR

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILD, D. W. or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also E. A. G. L. E. Brand, Fleur de Soufre, packed in double sacks, are the finest and PUREST sulphurs that money can buy; the 40 lb. 180 lb. and 180 lb. sacks.

For BLEACHING purposes, LEAVING NO ASH. VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure. In double sacks, for Dry Dusting and making Paste Sulphur.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and get you a profit equal to the amount paid out in labor for spraying your orchard, even if you pay your men \$1 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100% pure. This has increased various crops up to 500%.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur Mixtures, etc., and "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 deg. Be. Fungicides and Insecticides. Carried in stock and mixed to order.

Send for "ILLUSTRATED BOOK-LET"; also booklet "NEW USES FOR SULPHUR." Price-list, and Samples.

Long Pruning Demonstrated

(Written for Pacific Rural Press.)

The long system of pruning prune and apricot trees was demonstrated on four ranches in Santa Clara county last week by Prof. W. P. Tufts of University Farm, where several years' experiments have proved the value of this system in making stocky young trees. Big crowds of real fruit growers watched Mr. Tufts as he pruned various trees and each criticized the cuts according to his own opinion. The reason for each cut was explained as it was made. After pruning the last tree, Mr. Tufts said that farther down the row there was another tree of the same age (about four years) which had been pruned by the long system last year. Although he had not seen it, he said it

would be safe to guarantee that it was larger than the one just pruned which had been cut back last winter after the common fashion. The difference in height, diameter of trunk, and diameter of branches was so remarkable that some of the visitors would not believe both trees were the same age until the orchardist was found. Part of the difference was due to this tree being in a lower spot and having had more water. So to get a fairer comparison two other trees, side by side, were found, the only difference having been in the pruning. The one whose branches had not been cut back was notably stockier all through, so that any one could see the difference without measuring.

California Co-operative Canneries

Our readers will remember a note we published recently regarding the suit of The Fruit Growers of California, Inc., charging that the California Co-operative Canneries was an Armour project masquerading as a farmers' co-operative concern. The Santa Clara Unit of the Farm Owners' and Operators' National Association appointed a committee to investigate the matter and the committee reported November 6, as follows:

"We, your committee appointed to investigate the California Co-operative Canneries to determine whether or not said co-operative canneries are controlled and dominated by the Armour interests and whether same is worthy of the support of the growers,

beg to report as follows:

"1st. We find that no known Armour interests own or control any of the stock of said canneries.

"2nd. That we recommend said co-operative canneries to the growers of California.

"3rd. That we further find that said co-operative canneries have a most valuable marketing contract with the Armour Company, which insures a fixed market, which is so badly needed by any new co-operative canning company.

"(Signed): E. L. Fellows, San Jose, Cal.; W. J. Fulgam, Visalia, Cal.; Geo. C. Aydelott, Hanford, Cal.; F. Starr Walton, Yuba City, Cal.; J. A. Teagarden, Auburn, Cal."

Madera Mountain Apples

A revival of the apple industry in the lower Sierra Nevada seems to have taken place. In the Ahwahnee Valley in Madera County there are 200 acres of apples planted. Each year sees an increase in this acreage. W. C. Chaffee at Ahwahnee has set out 14 acres more. He took all ribbons at the Ahwahnee Valley Fair this year at Oakhurst. Six of his Kings measured 6 inches in diameter.

Mr. George Teaford of North Fork, Madera County, has one of the finest mountain apple orchards in the Sierras. He has two acres of 52-year-old trees, from each of which he took an average of 15 boxes this year. He

packed on the ranch and shipped by truck to Madera and Fresno. These apples brought him \$2 per box. This very old orchard is one of the few to be seen in the mountains today which has been properly and constantly cared for in the past years.

Wheat Embargo Removed.

All export and import embargo, restrictions on wheat and wheat flour are to be removed December 15. A partial embargo has been in effect in order to safeguard the supplies of the allies. Now the door is open to us to ship to anyone anywhere and base the price on world conditions.

Officers of Farm Owners' Association

Trustees of the Santa Clara unit of the Farm Owners' and Operators' National Association, elected in October, met November 15 in San Jose and organized, re-electing J. J. McDonald chairman, C. E. Warren vice-chairman, V. T. McCurdy, treasurer, and Miss Mary P. Richter, secretary. The new trustees are named below:

First Supervisorial District—Robert Britton, Luther Cunningham, J. H. Harkness, Morgan Hill; and Frank Stevens, Coyote.

Second Supervisorial District—J. A. Fair, John Hassler, John S. Hensill, and A. R. McClay, all of San Jose.

Third Supervisorial District—H. F. Curry, Albert M. Foster, Thomas D.

Landels, John W. Shaw, all of San Jose.

Fourth Supervisorial District—Arthur P. Freeman, Lawrence; T. J. Henderson, Campbell; A. W. Greathead, San Jose, and S. E. Johnson, Cupertino.

Fifth Supervisorial District—E. K. Clendenning, Campbell; J. K. Durst, Sunnyvale; E. L. Fellows, Santa Clara; and R. P. Van Orden, Mountain View.

Trustees at Large—Lewis H. Britton, Morgan Hill; J. J. McDonald, Milpitas; Charles E. Warren, Cupertino; V. T. McCurdy, Santa Clara, and F. C. Willson, Sunnyvale.

PACKERS SOLD TOO MANY RAISINS

To the Editor: Are raisin prices too high? While it is generally supposed the Wholesale Grocers' Association is responsible for this talk the members of the Association are pretty well convinced that the talk was fathered by outside packers, several of whom sold more raisins than they could buy. At the present time one of the outside packers is running an ad. in the local paper which reads: "We must have at once 100 tons Muscat raisins. Growers and others owning or controlling any Muscat raisins are requested to make us their offerings on or before November 15. On this date we will accept the most favorable offerings." Please note the

last ten words of this advertisement. If John Doe offers his raisins at 12c they will take Richard Roe's raisins at 8, 9, or 10 cents, as the case may be. Nobody in Fresno county believes there are 100 tons of Muscat raisins unsold, and it is rather discouraging to some of the outside growers this year to have the Association set the price at 10c to their members because there are a number who staid out of the Association in order to try and get a little better price, and they sold early in the season in a number of cases at 6 to 8½c. The people of Fresno and the Association members especially, have good reason to believe this is an attempt on the part of the outside packers to bust the Association.—A Raisin Grower, Fresno.

Here and There in the Fruit Business

Avoids Orange Thrips.

Of the many troubles met with by orange growers the thrips damage ranks high. Although a thrips-scarred orange is just as good to eat as a clean orange, its selling price is reduced very greatly, and that hurts. A small crop of clean oranges is as profitable as a big crop of thrips-marked oranges, so thrips control is well worth while. Whether removing dead twigs and leaves under the trees is responsible for it or not, the oranges of H. P. Taylor, close to Exeter, are astonishingly free from thrips injury, and from splits too; for that matter, though probably for another reason. Several years ago Mr. Taylor read in the Rural Press that dead leaves and litter in a vineyard provided a fine shelter for injurious insects and figured that if this was so with grapes it probably was so with oranges, so he had the leaves carefully raked out from under the trees. Whether this practice is responsible for it or not, the fruit for the last few seasons has packed a much higher percentage of first grade fruit than any orchard in the district. Before picking this season a careful search showed only one or two thrips-scarred fruits per tree. In many other orchards on similar soil a casual glance showed much damage from this cause. The trees were also loaded with an extremely heavy crop of very smooth, high-quality oranges. The leaves are generally raked out late in the fall, about the middle of November. It is a very simple, inexpensive job and if it does what it seems to do, the dividends it pays are enormous. Trials by many other growers would quickly prove its real value.—D. J. W.

Vineyard Cover Crops.

Certain farm practices that are highly recommended may be impossible to put into effect. Thus it is in Fresno vineyards on sandy and white ash soils when cover crops are mentioned. A cover crop is a fine thing for the soil physically and adds plant food too. But it is first hard to get a fall growth started on sandy soil in most cases. A soil with lots of clay will start a wild growth much quicker, and a planted crop will get hold quicker. The only thing to do in getting a good cover crop is to irrigate in the fall to bring up the seed artificially. However, on most vineyards the raisins are drying and trays are on the ground so long that it gets too cold to do any good irrigating for cover crop purposes and the only thing to do seems to be to let nature take its course. In orchards the case is altered, for the fruit is off earlier. H. B. Quick of Parlier got bur clover started on his place five years ago. His peaches were on the downgrade then, but they have done finely ever since and there has been a steady improvement in the soil. Once the clover got a good start it was easy to make it come the next year. [Possibly this would work in vineyards.]

Raisin Co. to Investigate Problems.

Problems of grape planting, cultivation, pruning, irrigation, fertilization, insect and disease control, picking and curing the crop, etc., are to be investigated by the California Associated Raisin Co. through a Bureau of Service recently inaugurated in charge of Fred K. Howard, formerly King's County Horticultural Commissioner. Assistance will be given to growers along these lines to enable them to increase their crops and produce raisins of the highest quality. The information will be furnished free to all members of the Association. No Worms Spread by Walnut Bags.

"Every walnut packing house in the State is now equipped with an electric laundry mangle for the treatment of empty bags before they are sent out to the growers." These mangles are heated and bags are rolled through them to kill codling worms or eggs before they are distributed. The California Walnut Growers' Association fears the codling worm as the worst pest of walnuts if it should not be

checked, and is actively in sympathy with the law passed at the recent session of the Legislature which Director G. H. Hecke of the State Department of Agriculture is enforcing through Field Entomologist D. B. Mackie. The law appropriates \$10,000 annually for two years "for the purpose of determining and applying control measures to combat the spread of the walnut codling moth." The State Director of Agriculture is empowered to enforce rules for this purpose. It is a criminal offense to distribute bags not processed by such mangles.

Pruning Branches for Quick Healing.

It takes more time to saw a branch from a limb without leaving any stub; and in practice such branches are seldom cut as close as they could be. Where a real stub is left, it does not heal over, but dries out and cracks. Wood rot gets in and, when a heavy load is on or a heavy wind comes, that is the breaking point. At the base of a branch is always a more or less distinct collar where the diameter of the branch is greatly enlarged. Experiments at the Wisconsin College of Agriculture have shown that the rate of healing is just as fast if the cut is made on the smaller diameter just outside this collar as if the cut removes the collar. In the latter case the cut is much larger and therefore takes that much longer to heal. It is concluded that the best place to cut is at the outer edge of the collar.

Orchard Planting near Paso Robles.

Over 2700 acres of orchards are being planted this year by the Associated Almond Growers of Paso Robles. Field Manager G. A. Nehrhood writes that he has purchased a little over 300,000 trees for this district and he thinks 100,000 additional will be planted. On its own land, this company is planting an average of 70 trees per acre. These are running 92 per cent almonds and eight per cent prunes. The prunes are three-fifths French, three-tenths Imperials, and one-tenth Robes. Mr. Nehrhood says, "I consider the Pacific Rural Press the best journal of its kind in the country; and I read it with much interest each week upon its arrival."

HORTICULTURAL JOTTINGS.

Oranges in Fresno are almost up to the required test and pickers are being signed.

Pear trees in Beaumont section of Riverside county are showing great distress from pear blight.

California Prune and Apricot Growers plan the erection of a \$100,000 packing house in Visalia.

Lemons in California are estimated at 77 per cent of normal as against a ten-year average of 86 per cent.

Bakersfield districts reports about 1,000 acres of cotton, selling at 40c per pound and seed at \$50 per ton.

Car shortage for citrus fruits is to be remedied at once, the Railroad Administration announced November 13.

The California Peach Growers, Inc., report shipment of 14,000 tons of dried peaches from Fresno district to date.

Yuba and Sutter counties figure on shipping 5,000 tons of raisins, which are 1,600 tons more than were shipped last year.

California Associated Raisin Co. re-elected Wylie M. Giffen Manager and enlarged their stock by \$650,000 at the recent meeting.

U. S. Bureau of Crop Estimates reports 42.6 lbs. of surplus honey per colony—an advance over last year, indicating better condition of bees.

Greco Cannery received its first order for \$2,400 worth of grape jelly. The indication is good for \$60 a ton for wine grapes, so the cannery claims.

A thousand sacks of almonds worth \$30 per sack were recently shipped in one car from the Sacramento plant of the California Almond Growers' Exchange. This is said to be the most valuable car of almonds ever shipped out.

Fumigation Plant for Nurseries

(Written for Pacific Rural Press.)

The nurserymen of California regretted that Senate Bill No. 940 was killed in committee. The bill provided for the appropriation of \$20,000 for the equipment of a State experimental vacuum fumigating plant for the destruction of insect pests on plants and nursery stock. As this is a matter that affects the whole horticultural industry it was felt that it was important enough to take under open discussion. The nurseryman, as the producer of young stuff for future orchards is the man who feels the need most of anything that shall aid in clearing stock from natural parasites and expedite the work of speedy transportation of the tree from the nursery to its future location. Delays are dangerous, and to nothing is delay more harmful than that of holding young plants and trees around whose roots pests are seeking security again in their natural element. The fish out of water is analogous.

Expert Advice Sought.

Dr. C. L. Marlatt, chairman of the Federal Horticultural Board, Washington, D. C., who addressed a Nurserymen's meeting, at their request, explained that in Federal Quarantine, where actual material was impossible of inspection because of its bulk and method of packing, vacuum fumigation was imperative. For instance, cotton from China and Mexico, whence came the boll-worm, was put through these vacuum fumigating plants at the rate of thousands of bales a day. Buyers themselves had built plants costing half a million dollars to expedite the work and insure themselves against loss. There are vacuum fumigating plants from Boston to Seattle, wherever large imports are made.

There are half a dozen large plants owned by the government where the fumigating is done at actual cost. The operation is very simple. One hundred and 60 bales of cotton go into the chamber on truck, vacuum is obtained in 10 minutes, and the whole operation is over in one hour, and not a living creature is left in the bales. There is a plant at Laredo (Texas) that holds 15 freight cars. These brick sheds are built on the border to provide for fumigation before any cotton is allowed to enter the United States.

Method of Driving in Gas.

After the cotton or merchandise has been placed in the chamber and the air exhausted the fumigating gas is turned in till the chamber is filled, then some air is again turned in behind the gas to thrust it into the bale.

Dr. Marlatt thought the plan of fumigating nursery stock possible and probably desirable. The Federal Board practiced it—even on delicate orchids from the tropics and other most delicate plants, with impunity. Under proper supervision nursery stock could be fumigated without injury to them and to the destruction of all insect life though it could not be expected to be of value against plant diseases. Dr. Marlatt was pressed for figures of cost and ventured a suggestion that an experimental plant to hold a carload of nursery stock might cost perhaps \$2000. Actual definite costs are in his files.

On a motion by Leonard Coates a committee of three nurserymen were appointed to investigate the possibilities of installing an experimental plant and working in co-operation with the State Horticultural Commission.

Astonishing Results from Use of Lime

(Written for Pacific Rural Press.)

The following notes are taken from a letter written by Karl Rudolf, Agriculturist for the American Beet Sugar Co.:

I submit herewith data of my 16 years' experience in using lime at the American Beet Sugar Company's ranch at Chino.

"Lime, if added to the soil, acts simply as a stimulant to crop production, which, however, will exhaust the soil and make it unproductive unless the necessary plant-food is given to the soil. At the Chino ranch we have been applying beet sugar lime for years on the land during beet slicing season, directly with the Steffens and filter-press water. Our results as to crop production have been astonishing."

"Heavy adobe, by the use of this lime, has been loosened to such an extent that while formerly eight head of stock were needed to plow, four are easily doing the work now."

"Lands which were completely exhausted have been made to produce heavy sugar beet, grain, alfalfa and other crops. The damage by insect pests was greatly decreased, inasmuch as the seed germinated quicker, the plant grew faster and offered greater power of resistance to these pests."

The following is analysis of sun-dried lime-cake from settling pond at the Oxnard factory:

Eight and .55 per cent organic matter; .33 per cent nitrogen; 54.36 per cent carbonate of lime; .57 per cent potash; .67 per cent phosphoric acid. The carbonate of lime will run up to

75 per cent, according to its moisture content. Having been burnt, hydrated, and composted, it is perfectly precipitated and is therefore in most readily available form.

For field and vegetable crops I advise applying six to eight tons of beet sugar lime to the acre.

For oranges and lemons from three to five tons per acre.

For walnuts from two to three tons per acre.

For olives, prunes, apricots, peaches, plums, cherries, pears, apples, figs and grapes from three to five tons per acre.

The best results will be obtained by double discing or spring-tooth harrowing after the application, followed by irrigation. The irrigation is the most important factor in order to obtain the highest results through the use of the beet sugar lime.

Lime on Truck Farms.

The continuous irrigation on truck farms necessarily sours the land, which can be sweetened and restored by the use of lime. Besides sweetening and aerating the soil it will help take water and hold the moisture better, create more vigorous growth and generally improve quality and increase the yield. Continuous growing of leguminous cover crops, heavy manuring, also the frequent irrigation of orchards and vineyards, brings about acid soil conditions which reduce the productiveness of the land. This can be prevented by an occasional application of lime.

EMPEROR GRAPE CONDITIONS.

Emperor grapes have been moving nicely from Central California vineyards. The berries may run slightly smaller than usual, but the color is excellent and quality fine. Cars have been supplied enough to keep the fruit moving. No damage was done by the rain of the end of October, as the weather cleared quickly and the berries dried promptly. Frosts following the rain were mild enough in the leading Emperor sections to do no damage. Shippers were offering \$100 a ton for grapes of those who did not

want to run marketing risks. The shipping season is practically finished. Seventy dollars per ton is quite a loss, but a certain Emperor grower of Tulare county lost that of about a fifth of his first day's picking partly because some of his grape were shaded too much and partly because some of the pickers were not watched carefully enough. A postponement in picking and careful instructions to the pickers saved such loss for the balance of the crop.

Before planting any crop, consider where your market will be.

How the Experience of Years Saves Money in This Post-War Maxwell

THE run of 300,000 Maxwells to date saves you many a worth while dollar in the new Post-War Maxwell. Those 300,000 saved in many ways.

More miles per gallon
More miles on tires

1. They taught "short-cuts" in manufacturing.
2. They eliminated all experimental work—you don't have to pay for a single engineering mistake.
3. They developed quantity production which has reduced "overhead."
4. They enabled quantity purchases; and better materials are bought at lower costs.
5. They taught how to build an almost trouble-proof car; you seldom take a Post-War Maxwell to a repair shop.
6. They taught how to get the most mileage out of a gallon of gasoline, a pint of oil and a set of tires.
7. They taught how to build a car that the less skilled driver would find simple to operate and take care of.
8. They taught that it was better to build more and take less profit per car rather than build less and take more profit per car.
9. They taught how to put more and more value in the car without increasing its cost.

This Post-War Maxwell is next year's car. It contains features developed during the war, many of which will find their way into other cars in the summer of 1920.

Table Fruit in the Citrus Country

(Written for Pacific Rural Press by D. J. Whitney.)

Two thousand acres of fruit and vines in one holding, practically all given to the production of table fruit; in other words, to the production of fruit for direct use, without drying, canning, or other processing; that is the holding of the Redbanks Orchard Company, about 12 miles northeast of Visalia, where hills meet valley, overlooking the delta of the Kaweah and St. John's rivers.

This ranch is noteworthy in several ways: it is thought to be the largest orchard of table fruit in California, therefore in the United States, therefore in the world. Secondly, it is in the midst of a very specialized citrus district and on theoretically excellent citrus land, in a stretch of country where the deciduous fruit and vines that are grown are used mainly for canning and drying. Furthermore, the ranch is noted for its excellent management and advanced methods. This ranch, therefore, though located in a section where its specialty is largely overlooked, in size and success, invites comparison with orchards and vineyards where table fruit is the main product. It indicates a fine line of development for all of the thermal belt of Central California.

Natural Conditions.

There can be no doubt that the very conditions that invite citrus success in Central California invite success with many kinds of early shipping fruits, likewise late shipping fruit (better say, late shipping grapes). These conditions are rareness of killing spring frosts, or of serious spring rains to prevent good pollination of the bloom; warm, dry weather to hurry ripening and (in the fall) few rains or frosts to spoil the late fruit. Up to the present time, save for Emperor grapes and early plums, most non-citrus planting has been directed toward dry or canning peaches, raisin grapes, figs, apricots and olives—all good in their way, although there is no doubt but that shipping fruit pays big profits when it is grown and handled right.

This ranch was started about 17 years ago, and a big variety of fruits and vines were put out with the expectation that a number would prove unsatisfactory. Those which have done poorly have been pulled up or worked over. Those which have been successful have been increased so that the result is, a considerable variety of fruits suited for the location is now grown. The list is interesting.

Tractor Pulls Orange Trees.

A 20-acre orange orchard on a side hill with southwest exposure, as ideally located for frost as could be devised, was one of the first plantings. Early this September a tractor was brought up, hitched to one tree after another and the lot pulled out. It is surprising what long roots came out by this method. It would seem that no grubbing at all would be required to clear the land up. The trees were thrifty, bloomed heavily, but would not set good crops.

It is noteworthy, however, that this uprooting is not aimed at the citrus business as a business, for Phil Baier, principal owner and manager of the company, is planting 230 acres of young citrus trees on valley land of his private holding close to the Redbanks ranch.

Furthermore, not far from the uprooted orange orchard, higher up on the side hill, a peach orchard is being replaced by lemons, which do excellently under such locations, so citrus trees are all right in their place.

Near the old orange orchard is a small block of olives of an oil variety, planted at the start. Heavy bearers in good seasons, but with fruit too small for the cannery, the olives are all used on the ranch and in that way are profitable, but the olive acreage is not being increased, table fruit being considered more profitable.

Of other fruits the tendency is away from peaches and toward plums and grapes. The management claims to have usually the earliest peaches in the State, which are shipped mostly to

Los Angeles and San Francisco, poor shipping qualities of early varieties preventing Eastern sales. When it comes to mid-season varieties the competition from Eastern peaches is getting more and more to reduce profits and to increase the risk so peaches are not held in high esteem by the owners.

The plum business, though, is prospering. A long stretch of hillside, with a southwest exposure, comprising part of the ranch, gives extremely early fruit and enables them to get the cream of the market with early varieties, like Climax, Beauty and Clyman. The bulk of the plums are Tragedies, which many orchardists in the district have planted.

Grapes.

Grape varieties have been reduced to five or six main kinds, with a few of several other varieties, Emperors, Malagas, Tokays, Cornichons, Almerias and Wilsons leading.

Emperors are deservedly the popular shipping grape of the district, late, beautiful in appearance, an excellent shipper, heavy bearer, and now that the redwood sawdust packing has been discovered, keeping in first-class shape far past the holidays and commanding very high prices. High trellises over some of the rows were early tried and are still in use. They are successful in some ways, but are troublesome in cultivating, as the canes hang down from them and get in the way of the horses, so standard methods of pruning are adopted for all new plantings.

About the only Malagas of the district (at least, that the writer knows of) are grown here. As a rule this ranch is able to ship out the first car of them. To do so in any place requires careful, selected picking. This year, owing to labor costs the management waited until all the grapes were marketable, so as to have only a single picking and Dinuba beat them out. Malagas bring fine profits, as they are the first high-class eating grape in the market after the Thompsons, and early shipments command high prices. The Wilson grape is like the Malaga, larger and with more base, but later. In fact, the difficulty of getting enough sugar in the juice to meet legal requirements is against it. The red Malaga, or Marvel of Malaga, is grown some, but is not thought much of.

Tokays Are a Surprise.

This Central California district has a poor reputation for Tokays, although they produce well. The hot, dry atmosphere seems to be bad for the color. Seemingly it takes the Lodi climate and the black soil of Lodi at that to justify the term "Flaming Tokay." Where this ranch wins out is in earliness. They can put excellent Tokays (save that the color is light) into the market three weeks ahead of Lodi and quit shipping when prices fall down a bit, then when Lodi quits they can start picking once more. The moisture of the Lodi district, and earlier fall rains, compel Lodi growers to keep shipping while they can. In this dry, clear atmosphere, by keeping the water in the soil, the grapes will hold on the vines for a long time without getting over ripe and then, when shipping looks promising again, the water is taken off, the fruit sugars up, and marketing can begin all over again. This rule holds true for Malagas and Cornichons also. It seems peculiar that the same vineyard can get both the early and the late markets for one variety, but it can be done by adapting methods to natural conditions.

Almerias.

This variety, shipped from Spain to Atlantic ports in immense quantities and at high prices, for late markets, holds attractive promises to California vineyardists in late districts, now that redwood sawdust has proved superior to Spanish cork as a packing material, and it is one of the Redbanks leading grapes. Certain difficulties with it offset its good qualities enough to make other grapes just about as profitable. It is late in coming into bear-

ing and apparently requires very long pruning to make a crop. One special requirement, or help, in proper cropping, is to have Emperors planted

very close to it in parallel rows, seven feet apart. This is to provide shade, for the Almeria seems to require more shade than its own fol-

age will give. Close planting of Emperors next to it seems to fill this need. The quality of the Almerias from this district is excellent in comparison with the Spanish grapes. The main necessity to make the Almeria rival the Emperor in popularity is to find how to make it produce right.

One of the features of the ranch is the excellent accommodations provided

for the help. All of the buildings are attractively designed and well built and have the surroundings well kept. There is a swimming pool for help in summer, reading room, good dancing hall, player piano and other accommodations to make life agreeable and pleasant. Its location off the usual run of travel has caused it to be less known than its merits deserve.

The Farmers' Union of America

(Written for Pacific Rural Press by C. W. Blabon, Sec'y-Treas. Oakdale Farmers' Union.)

The 1919 State Convention of the Farmers' Educational and Co-operative Union of America will be held in Oakdale, Stanislaus county, California, on the 2nd, 3rd and 4th days of December. There was keen rivalry among several of the larger cities of the State for this honor, and Oakdale can count herself fortunate in having secured the State Convention of this great State and National Organization. The Farmers' Educational and Co-operative Union of America is a Fraternal Beneficiary Association of Farmers, whose purposes are as follows:

To secure equity and establish justice and apply the Golden Rule.

To discourage the credit and mortgage system.

To assist the members in buying and selling.

To educate the agricultural classes in scientific farming.

To teach farmers the classification of crops, domestic economy, and the process of marketing.

To systematize methods of production and distribution.

To eliminate gambling in farm products by Boards of Exchange, Cotton Exchanges and other speculators.

To bring farming up to the standard of other industrial and business enterprises.

To secure and maintain profitable and uniform prices for cotton, grain, livestock, and other products of the farm.

To strive for harmony and good will of all mankind and brotherly love among ourselves.

To garner the tears, of the distressed, the blood of the martyrs, the laugh of innocent childhood, the sweat of honest labor, the virtue of a happy home as the brightest jewels known.

Production, Marketing, and Legislation.

The farmer has three problems, and prospers or does not prosper in proportion to the success with which he handles them.

He must know how to farm scientifically.

He must know how to market scientifically.

He must know how to have legislation in his interests.

These things he can accomplish only through co-operation with his fellow-farmer. The individual farmer can only produce; there his efforts must cease, until he has learned to organize. It matters not how much he may know, how scientifically he may farm, he is powerless, unless he co-operates with his brother farmers along lines that will enable him to market his products in a businesslike manner.

Stanislaus Farmers' Union Activities.

Many and numerous are the ways by which the Farmers' Union can and has assisted its members. Among our local activities we mention a few. The farmers of Stanislaus county own and operate one of the largest warehouses in California, situated in Modesto. This Co-operative Warehouse covers the major portion of a city block and cost over \$10,000 to erect, the whole amount being subscribed by farmers. Here the farmer is enabled to dispose of the great bulk of his produce and procure for it the highest prices. He is enabled to purchase all his wants along this line from his own warehouse. The producer and consumer is brought face to face, and the middleman is eliminated entirely from the bargain. Were it possible that this method could be pursued throughout the entire country the great H. C. L. would cease to be the boggy that it is.

In the thriving town of Riverbank, Stanislaus county, one of the most successful co-operative stores is in operation. This store is owned and controlled by farmers and railroad brotherhoods jointly. They carry upwards of a \$10,000 stock, and save the members \$500 to \$600 per month. Here again the small producer finds a ready market for all his produce. He receives all that is paid, and the consumer receives in rebates on his purchases an amount aggregating a saving of approximately 20 per cent on his monthly bills.

The Farmers' Union Co-operative garage, to be erected and owned by the Farmers' Union of Stanislaus County, in the city of Modesto, is to cost in the neighborhood of \$6,000. Nearly every farmer is the proud owner of a car, and this Co-operative Garage is receiving the generous support and financial aid of every Farmers' Union member in Stanislaus county. The Oakdale Farmers' Union is contemplating the erection of a similar garage to the one being erected in Modesto.

Legislation but No Politics.

While the Farmers' Union is in no sense a political organization, it takes an active interest in all public questions of the day, both State and National. Under no circumstances, however, can it enter sectional politics. It cannot endorse a candidate, put out a candidate, nor formulate a platform. At its conventions it agrees on certain measures, and elects legislative committees. These committees argue before committees having certain legislation, either detrimental or beneficial to the farmers' interests, pending passage. In this way great pressure is brought to bear to either kill or pass a measure as the case may be. The writer and State Secretary Fred Millard were appointed by Senator J. M. Inman to serve on the California Asiatic Exclusion League which met in Stockton last September, and pledged the support of the farmers of

the State of California in the work of the organization.

Social Side Important.

The Farmers' Union is made up of many small units known as Locals, and it is within these locals that a spirit of comradeship and brotherly love is engendered and fostered. Lectures, debates, socials, dances, suppers tend to lighten the hours of long winter evenings.

It has been said, and truthfully, that no home is so capable of giving to the world a race of patriotic, loyal and intelligent citizens as that of the American farmer. The constant association with nature and her beauties tend to develop and bring out in the heart and life of the farmer all that is noble and good and true.

AGRICULTURAL NOTES.

On October 4, 1,101 crates of onions and 2,174 barrels of potatoes were shipped to the West Indies from New York.

A number of growers interested in certified seed potato production met in the State Director of Agriculture office November 17.

Official changes in the Turlock Merchants and Growers, Inc., have put H. W. Rickenbach in the presidency, and have made D. F. McHaffey sales manager.

The California Vegetable Union has recently opened a branch office in Sacramento which will handle their business in the northern part of the State.

About 2,000 acres of potatoes, onions, cabbage, and lettuce are to be planted in Sutter Basin to be marketed by the California Vegetable Union.

Three to five cars of hay are being shipped daily from Pixley, Tulare County to Los Angeles, over 1,000 tons having been shipped. The Tip-ton and Earlimart districts are also shipping large quantities of hay.

No advance in prices of sulphate of ammonia, dried blood, tankage and cottonseed meal for fertilizer, or fish scrap is to be allowed over prices in effect October 7, as ordered November 11 by the U. S. Department of Agriculture.

The State Department of Agriculture has collected all of its various bureaus and moved all together to the Rebis Hotel building in Sacramento. A lady called at their new quarters thinking she was in a second-hand furniture store.

We speak of the two dry years just passed, but Sacramento claims four dry ones. In the past four seasons 61.84 inches of rain have fallen there. This is the driest quadrennial since that beginning in 1855, when rainfall totaled 60.83 inches.

Lima Bean Marketing Contract

Many of the large growers of lima beans had contracted their crops for a term of years to shippers outside the California Lima Bean Growers' Association. Last year the largest three factors (the Association, the A. & H. Levy Co., and the J. M. Waterman Selling Agency) were unable separately to market the crop. It was only by an emergency combination of practically all factors into the Lima Bean Selling Agency that the crop was cleaned up before the 1919 crop started to come in. That Selling Agency wound up its affairs this fall and the three big factors united with control of more than 80 per cent of the total crop under terms of the following proposed agreement as furnished us by R. L. Churchill, Manager of the Association. This puts control of the marketing of more than 80 per cent of the limas in the Association, which employs the other two factors as brokers. The contract is to run five years with an option whereby the Association may renew it on or before January 1, 1924.

1. Contingent upon the membership of California Lima Bean Growers' Association being brought to the point where our Association will have charge of the marketing of at least 80 per cent of the total 1919 crop of limas and baby limas grown in Southern California, said estimate to be made not later than August 1, 1919, our Association proposes to enter into a contract with the A. & H. Levy Company and the J. M. Waterman Selling Agency, appointing these two firms joint selling agents with the Association's own marketing organization for the marketing during a five-year period of the beans controlled by our Association during that period.

2. All the beans to be sold by the three marketing agencies are to be sold upon a uniform form of selling contract.

3. The Board of Directors of the Association shall formulate rules and regulations governing the marketing, fixing prices, determining quantities to be sold and the manner in which offerings shall be made, establishing standards of grade and quality, which rules and regulations are to be kept by the Levy and Waterman companies and by the Association's own selling organization.

4. The Levy Company and the Waterman Selling Agency, and any member or partner of said firms, are to be bound not to handle or deal in lima or baby lima beans directly or indirectly for their own account or for the account of any one other than the Association during the life of the agreement.

5. The Levy Company and the Waterman Selling Agency are to exercise every proper influence within their power to cause bean growers to become and remain members of the Association during the life of the agreement.

6. The Association is to pay to the Levy Company and the Waterman Selling Agency as full compensation for their services under the agreement, a flat brokerage rate (without maximum or minimum) of five per cent. upon the f. o. b. coast selling price of lima or baby lima beans sold by said firms upon sales confirmed by the Association. Out of said five per cent. flat brokerage the selling agents are to pay the brokerage of 1 per cent customarily allowed upon sales of beans to broker representatives in distributing markets; also the 1 per cent cash discount usually allowed to purchasers when drafts are paid on presentation. No extra brokerage or special discounts to be permitted.

7. Members of the Levy Company and the Waterman Selling Agency are to have full opportunity to confer and consult with the board of directors of the Association with reference to all matters pertaining to the marketing of lima and baby lima beans, and are to be treated fairly and impartially by the Association.

8. The Levy Company and the Waterman Selling Agency are to be bound to keep all the terms and conditions of the selling contracts and the rules and regulations established by the board of directors of the Association under penalty of cancellation of their contracts and forfeiture of an indemnity bond.

9. The Levy Company and Waterman Selling Agency are to be free to contract or purchase lima and baby lima beans of the 1924 crop upon their own behalf, provided the Association does not notify them on or before January 1, 1924, of its intention to continue similar agreement.

Alameda County Farm Bureau Meeting

(Written for Pacific Rural Press.)

The annual meeting of the County Farm Bureau for the purpose of election of officers, listening to a resume of the work done by the various workers in the county organization, and witnessing demonstrations in livestock judging and poultry work, was held at Hayward Saturday, November 22d.

The chairman of the committee on Agricultural Clubs, M. L. Mowry, of Centerville, reported that while five clubs had been formed in 1918, there had been no progress in 1919 in actual formation work, owing to the lack of an Assistant Farm Adviser. Several will be formed as soon as this vacancy is filled.

President Rinderspacher gave a summary of the activities of the Farm Bureau during the past year. Among other things of great benefit accomplished was the changing in the proportions of the amount of barley and wheat raised in the county. Formerly the proportions were 25 per cent wheat and 75 per cent barley, which percentages have actually been reversed. A saving of from 3 to 5 cents per pound on the purchase price of copper sulphate (blue vitriol) was effected as well as 5 cents per pound on binder twine. These are the salient features of the work, showing direct benefit.

Farm Adviser M. A. W. Lee made a business talk about what the Farm Bureau meant to the agricultural communities of the United States, and to California in particular, mentioning all the activities that had been touched upon in Alameda County.

Dr. J. J. Hogarty, County Livestock Inspector, in his talk confined him-

self chiefly to blackleg and its control, emphasizing the fact that stockmen generally will not vaccinate their stock until they have lost some. In other words, "they have to be shown" that it is necessary.

J. F. Mullins, Chairman of the Board of Supervisors, spoke on "Supervisors' Interests in Rural Development," and said that the Supervisors had been public spirited and granted all reasonable request. Also that the county was fortunate in having such a great corps of specialists in the agricultural work.

Horticultural Commissioner F. Seulberger spoke on "Rodent Control and Standardization of Pack," and stated that 200,000 acres of land had been gone over in the distribution of over 21 tons of poisoned grain with an estimated killing of 6,000,000 rodents. Mr. Seulberger said the poisoned grain produced excellent results during the dry season, but results by this method were nil during the rainy season.

The closing of the educational features of the day were a talk on "Brooding" of young chickens by Prof. J. E. Dougherty of the Poultry Division of the University of California, and livestock judging demonstrations by Farm Adviser Lee and L. Kelly, superintendent of Shore Acres Dairy.

A fifty-plate banquet and dance in the evening marked the close of a very pleasant and profitable day.

Squirrels fattened on good barley this year. There is a better way to get rid of the grain—poison it.

UTILITY TRAILERS

UTILIZE THE TRUCK'S IDLE POWER

Utility Trailers are operated by the power that usually goes to waste. By equipping your truck with a "Utility" you can double your hauling capacity and save 50 per cent hauling cost.

Two-wheel and 4-wheel trailers, ranging in capacity from 500 pounds to 10 tons.

Utility construction is distinct. There are many facts you should know about these dependable models.

AUSTRALIANS GRATEFUL TO AMERICA.

To the Editor: Having just read an article contained in your issue of November 1st, referring to our advent in this wonderful country, and some of its phases—I just felt that it was one more instance where I wanted to send thanks for the sentiment contained therein.

It would be difficult to fully express our appreciation of the way in which America has thrown open her arms to us right from the first suggestion of this trip. Though having mixed considerably with the American soldiers in France, and realizing that a distinct friendly feeling existed between those of our two great countries, our arrival in New York on September 4th seems to have been a signal for a rapid and apparently endless succession of happy experiences in coming in contact with your country and its people, and at first hand realizing by this contact the excellent fellowship existing.

Besides the social pleasure experienced here, our party, without exception, is gaining great benefit educationally. The seventy-five members now taking definite courses here are rapidly realizing the greater necessity of the co-operation of science with agricultural pursuits and aside from an anxiety to seize all possible knowledge available, our people are keen to spread the news first hand in Australia of the magnificent manner of organization which renders available to practically the lowliest a series of educational courses, agricultural and other, fitting him for thorough future citizenship, as allowed by the University of California and its branches.

Most interesting reports are frequently reaching me from those twenty members of our party distributed throughout California. These members are attached to various institutions, farms, factories, fruit orchards, etc., and I like to take this opportunity of referring to the generous way in which they are being received and assisted to gain knowledge, not "American Secrets," but sound, general knowledge in which America leads us, and which, by distribution, we feel sure will aid tremendously in the future mutual benefit of both our countries.

I sincerely hope that our visit will be the means of encouraging at least some of our American brothers to take a similar trip to Australia, where, though they may not gain greatly in intensive agricultural knowledge, many items of interest to them may be found, and an opportunity afforded us of returning at least to a small degree, the fine generosity we are experiencing here. E. H. DAVIES, Captain.

Care of A. I. F. Irrigation Students in America.

BEANS SOLD TO EUROPE.

In a communication from the California Bean Growers' Association they say that with the assistance of Herbert Hoover, they have sold 3500 tons of 1918 crop of white beans for export, which will be filled from holdings now in New York City. This order was placed with the European relief commission. After many months of waiting this is the first actually completed sale for export and the trade is now proceeding to cover its season's requirements at prevailing prices before the normally expected advance.

Mr. Hoover is quoted as saying, "there is no reason for American beans selling below cost of production as Europe needs all surplus bean stock over home requirements." It is believed that from now on the filling of foreign export orders will soon absorb the 1918 surplus.

The active interest of Mr. Hoover in assisting the California bean growers to obtain foreign export orders will help materially in relieving the distress which was occasioned on account of the purchase by the Government of Oriental beans during the war, and is greatly appreciated by California bean growers.

The rice crop of Glenn county is estimated to be worth \$10,000,000.

Before planting any crop, consider whether your moisture will be sufficient.

Two vegetable canneries are soon to be added to the three already at Isleton, Sacramento county.

School grounds are molding your children's ideals of livable surroundings. Many of them are too barren.

6% loans to farmers!

Do you want money on a *non-maturing mortgage* for a term of 5 to 40 years? Do you want to re-finance your present mortgage? increase your land holdings? buy additional equipment or live stock?

The farmers, horticulturists and stock-owners of California and Oregon may now obtain 6% loans ranging in amounts up to \$37,500. This has been made possible thru the recent organization of the California Joint Stock Land Bank of San Francisco.

Loans made by this bank may be paid off any time after five years—and the borrower may enjoy the unusual privilege of taking 40 years to repay his loan in installments.

The loans are made under the supervision of the United States Government.

Important Features

1. No limitations or special conditions as to how money borrowed shall be used.
2. The mortgage never becomes due. You pay no renewal expenses.
3. Payments may be extended over a period of 40 years.
4. The land may be sold subject to the mortgage.
5. The borrower pays no commission. We loan *direct* to farmers. Loan made up to 50% of appraised value of the land, and 20% of the insurable improvements.
6. Positively no red tape of any kind.
7. The best and broadest type of service ever extended to farmers.

Significant Agricultural Pointers

Baart and Bluestem Wheat Compared.

A fine comparative test of Bluestem and Early Baart wheat last season is reported by Warren & Sebbelov of the Natomas tract in Sacramento county. Eight hundred acres of Bluestem and fifty-one acres of Early Baart were seeded between November 10 and 20 at the rate of 80 pounds per acre. The Bluestem showed up a good stand before the Baart began to appear. It seemed to require less moisture to germinate. Owing to the dry fall they never did get half a stand of Baart, although the land and preparation were the same for both varieties. "Once out of the ground, however, the Baart soon outgrew the Bluestem and particularly displayed a tendency to stool which we have never seen equaled by any other variety of wheat on this kind of soil; i. e., heavy adobe with a few inches of sediment on top. I counted as high as 42 heads on one stool and would put the average at fifteen or twenty; while Bluestem never has produced over six on the average. All Baart heads were large and well filled from top to bottom. Although two weeks behind the Bluestem in coming up, the Baart matured two or three weeks earlier, yielding from 51 acres a total of 974 sacks or 19 sacks per acre. We are wondering what kind of a crop we would have had if all the seed had sprouted. Bluestem in two adjoining fields of same soil and showing a perfect stand averaged 14 1/2 sacks per acre. The coming season we expect to plant half of our acreage to each variety which will enable us to cut the Baart before the Bluestem gets too dry."

Organize to Standardize Tomato Packs

Owing to the difficulties experienced by Merced growers last summer in trying to market unstandardized packages of tomatoes, they have organized the Merced Growers' Packing Association. Members have agreed to deliver to the Association all vegetables grown by them for packing and marketing. Instead of unsupervised scattered packing, there will probably be uniform packing next season which will conform to the law.

Potato Storage Requirements.

To take good potatoes out of storage several points must have been observed. Undiseased, uninjured potatoes must have been cooled from outside to center before being stored. With our cold nights in California this is seldom difficult. The storage room needs ventilation to carry off heat and moisture that develop from the pota-

toes during storage. But there must be no rapid changes of temperature and no high temperature. They are best kept at 34 to 38 degrees. Walls of the storage room may be double and filled with sawdust and provided with windows to be closed during day times and opened at night except in freezing weather. In the Delta many potatoes are left where they grew in well drained land until along in January or later.

Spray for Cabbage Worms.

Spray cabbages when the worms first appear. Arsenate of lead is the commonest spray, used at the rate of one pound powdered arsenate per 50 gallons of water. Twice as much arsenate is needed if the paste form is used. Add two or three pounds of laundry soap per 50 gallons to make the spray stick to the waxy leaves. One-half ounce of powder and an inch cube of soap per gallon will work for smaller quantities. There is no danger of poisoning consumers of the heads, but the outer leaves must be destroyed.

"It Increases My Self-Respect."

"I toiled, I sweat, and I produced—and I sold at the other man's price for his profit. I produced better stuff than my neighbors only to find that theirs set the price, very often, at which I must sell in the local market. By consistent advertising I have been able to secure a fair price. My experience is that advertising pays more than it costs. It frees me from my neighbors' limitations. It increases my self-respect and has added hundreds of acquaintances and friends."

Irrigating Old Grain Foothills.

Irrigation is reclaiming the foothills east of Marysville from the waste caused by years of thin grain farming. Four co-operative irrigation districts are operating in this section, two having been formed recently. These are the Cleveland and the Honcut systems.

Standardization Fines Doubled.

Fines have been doubled each time for three convictions obtained against a Japanese in Alameda county for violation of the Standardization law in packing tomatoes. The fines were \$25, \$50 and \$100. After a while this man will learn to be good.

Fewer Squirrels, More Feed.

Hogs instead of squirrels are eating the acorns in the Lynch district of San Luis Obispo county for the first time. Squirrels were well nigh exterminated here last summer at a cost of about 23 cents per acre.

How Can We Increase Wheat Yields?

(Written for Pacific Rural Press.)

The average yield of wheat per acre in this country is only 15.5 bushels, according to Dr. R. J. H. DeLoach, director of the Armour Farmer Bureau. The world's total wheat crop is a little over 4,000,000,000 bushels. The Minnesota Experiment Station found that it required 12 1/2 hours of human labor and 30 hours of horse labor to produce an acre of wheat. Take present prices of labor and wheat and about \$20 per average acre would be the return, from which interest on fixed capital and taxes have to be deducted. The higher the yield per acre the less the proportional cost of overhead. Except the increased cost of threshing and sacking, a 30-bushel crop costs no more to raise than a 15-bushel crop.

It is pointed out by Dr. de Loach that the first way to reduce cost of wheat production is in the selection of seed. Generally, at least one-third of the plants in any field are failures.

The next principle to be observed is the proper rotation of crops, whereby cover crops can be plowed under one year in two or two years in three. Each section of the country has its own crop rotation system, but the plan must always provide for a substantial production if organic matter is to be returned to the soil.

The third point for consideration is the proper balancing of plant foods in

the soil. Belgium applies more plant food per acre to her wheat-lands than any other country on the globe, and, just prior to the war, reported the highest yield per acre of any country in the world and the lowest cost per bushel to produce.

Eighty per cent of our grains are fed to live stock and 20 per cent eaten by humans. It is through our live stock that much of our soil fertility is maintained and our own rations balanced.

Half the States in the Union grow less wheat than they consume while the other half grow more, with a net surplus for the whole country of 317,530,000 bushels in 1918. The North Central States west of the Mississippi River grow about 70 per cent of the surplus.

In the United States, to increase wheat production, we can only intensify farming—produce more per acre. Our own University and Experiment Stations have done much experimenting with wheat varieties suited to the various localities and conditions of California. It used to be said that our State could not produce a strong glutinous red wheat. The splendid grains exhibited at the State Fair by different counties, with their high yields, show that we can and do produce a strong red wheat of high productivity. Start with good seed.

TRAPPERS

You Will Dance

with joy when you get your returns for furs shipped to the Abraham Fur Co., the house that never disappoints fur shippers. Our expert graders in our "Take-up" Department have positive instructions to see that every shipper gets a liberal grade on every skin and are held accountable for all furs taken up by them. Our prices are the highest ever known and now, more than ever, you need the services of an old established, reliable and experienced fur house. There are no fur houses in the world which have these qualifications to a greater extent than the Abraham Fur Co.

Ship Every Pelt You Have—Now

We urge you to send us your next shipment of furs and let us prove to you that our prices are the highest—our grading the most correct and liberal and our returns most prompt. We have been in the fur business continuously for 43 years and we have made more staunch friends and have a larger percentage of regular old shippers than any other fur house in the U.S. These facts justify our claim that Abraham is America's Leading Fur House. Other fur houses make the same claims, but it is generally conceded by our competitors that the hardest fur house to fight against for business is the Abraham Fur Co. Why? Because our returns are always top of the market and any fur house that wants to keep pace with us will have to go some and be on the job early and late.

SUPPLIES Get one of Abraham's wonderful Smoke Pumps — \$2.00 postpaid, with extra extension \$2.10. Abraham's Animal Bait and Trail Scent \$1.00 per bottle, 3 bottles for \$2.50. Best bargain in Rain Coats \$5.95. Get our free book "Fur Facts" and Trappers' Supply Catalog. It's free—drop us a card today. Weekly Reports—Tags and other literature—also free. Get the whole business with one postal card—write today.

Nut Grasses and Their Eradication

To the Editor: Please identify the enclosed grass for me. It is a new pest to this part of the country. There is a suspicion that it was introduced from abroad in the fibrous bark of some date-palms. It spreads by underground runners, which form nodules or bulblets at intervals. These form at all depths down to twelve inches, and sprout independently, making the grass almost impossible to eradicate, as these bulblets will survive any amount of drought and cannot be destroyed by cultivation. They have an aromatic, bitter taste, a little like aloes.—W. F. A. M., Thermal.

(Answered by Professor P. B. Kennedy, University of California.)

These are plants of the sedge family, very much resembling grasses but with triangular instead of round stems. The flowers and seeds are borne in clusters, terminating the stem, which spreads out at the top like the ribs of an umbrella. The roots creep under the ground, and here and there swell up into thickened parts of various shapes and sizes, the largest being about one inch. These are storage reservoirs of food material and are quite palatable, and explain the name of nut-grass.

They have a very wide distribution from Maine to Florida, and west to California and Texas. Their natural habitat is in wet ground, and, unless drainage can be secured, their eradication on such ground is well nigh impossible.

It reproduces both by seeds and by these underground nuts, so that mowing to prevent the production of seed is not sufficient. The nuts must be destroyed. Ordinary cultivating once or twice a year only encourages the growth of both the plant and the nuts, and has a tendency to enlarge the area

by dragging the infested soil containing the nuts over more and more territory.

Therefore the nuts must be removed from the soil in toto, or starved out. As they receive a large part of their nourishment from the air through the leaves, by allowing no leaf growth to be produced the nuts must eventually succumb from lack of food material. But the land must be valuable to pay for the labor involved, as it may take one, two, or even three years to get the best of it. Some advantage may be taken of the palatability of the nuts by plowing frequently, thus aiding hogs, which are very fond of them, to eat as many as possible. Geese or goats confined in the patch would also tend to greatly lessen the leaf growth.

After this cultivation may be resorted to with good chances for success, either with or without a crop on the ground. The nature of the crop should be one that could be cultivated in two directions, and the sweep type of cultivator, which cuts off the plant just below the ground, is the only one to be considered.

Arsenic spraying may prove to be the correct method of control, but we do not know of its having been tried out.

When all is said and done, it is a serious pest, and as it usually gets started from a very small beginning, perhaps a few nuts hanging on to the roots of nursery stocks or with balled stock, "a stitch in time" is the old but very appropriate adage in the control of nut-grass. In its incipency the whole infestation, plant, soil, nuts, and all, could be taken away in a wheel-barrow, and given such a warm reception that the troubles of years could be avoided in one hour.

is packing the soil too much. For that reason toothed tools are used after plowing wherever possible to get the depth required.

SULPHUR INCREASES ALFALFA.

Sulphur as an alfalfa and clover fertilizer increases the size and branching of the roots, and builds up vigorous nodules of nitrogen-forming

bacteria, as shown by several years' experiments at the Oregon Agricultural College. The plants are of denser, darker foliage and the quality of the hay is improved by increasing the sulphur, protein and nitrogen content. The sulphur is applied in the form of gypsum, flowers of sulphur, iron sulphate or superphosphate. A bulletin has just been issued giving details of the experiments and results.

NEWS NOTES FROM NEVADA

Mr. W. D. Duke of Likely, California, which is near the Nevada-California line, has purchased a new ranch in northern California. Many Nevada breeders who have made annual purchases of Hereford bulls from Mr. Duke's herd in the past will wish him well in his new location.

Mr. Jas. N. Hollenzer of Ursine, Nevada, is a new breeder of Shorthorns. He is located in one of the beautiful little valleys of southern Nevada, where the feed elevation and climate are conducive to the development of a high-class herd of pure bred Shorthorns. The herd consists of some ten or twelve females of excellent type, headed by the good bull, Types Boy, by Cumberland Type.

Mr. J. Selby Badt, manager of the Warm Creek ranch, Wells, Nevada, has added two Shorthorn heifers, Pacheco Lass 141 and Crimson Bud, from the Pacheco and Miller herds. The heifers were purchased at the San Francisco Shorthorn auction held during the Livestock Show.

Mr. Badt is building up a good Shorthorn herd and the new purchases make an excellent addition to his good herd.

Mr. Wm. Short of Ruby Valley has just returned home from attending the series of Shorthorn sales held in Southern Idaho.

Mr. Short purchased a small herd of eight females and a good herd bull to add to his pure bred herd of Shorthorns.

During the past few months he has sold around two hundred and fifty head of pure bred, but unregistered Shorthorn cows in order to give more attention to his registered herd.

It is very seldom that a purchaser is able to buy an entire herd of pure bred cattle that has been in the hands of one breeder for a long period.

Mr. A. M. Heaton of Las Vegas recently purchased the entire herd of Dutch Belted cattle of Frank Reed Sanders on the 21st anniversary of Mr. Sanders' entry into the Dutch Belt business. In this herd was the outstanding cow Thelma of Columbia.

Included in the deal were also a few registered Jersey cows.

Mr. Heaton furnishes milk and cream to the dining car service, and is

building up a high class dairy near Las Vegas.

Mr. Raymond Husted, general manager of the Wyoming Hereford Corporation of Cheyenne, Wyoming, passed through Reno last week with a shipment of a car load of Hereford bulls and heifers which he delivered to the H. F. Dangberg Land and Livestock Company of Minden. The bulls were for range purposes, while the heifers were for the breeding herd.

BEANS AMONG TREES WITHOUT IRRIGATION.

(Written for Pacific Rural Press by Geo. L. Horine, Winton.)

Down here in Merced county we are beginning to hear talk of having another dry year. Whether we do or not, time will tell, but there can be no harm in taking dry year precautions.

Last season was one of scant rainfall and short irrigation down in this section, and many orchards suffered greatly. If the method of treatment of my two-year-old almonds would be of interest I should be glad to explain it. Let me say that on the part of the orchard referred to, the water level is 22 feet, and no irrigation whatever was resorted to. Numbers of these trees put out new growth of twenty or more limbs six to eight feet in length. The land is sandy loam. In addition to this a fair crop of black-eyes was raised between the trees.

The land was plowed late in December away from the trees nine inches deep. It was then allowed to lie just as the plow left it until early April, when it was replowed toward the trees about six inches deep. Follow this I spring-toothed twice in each direction as deep as I could set the springtooth. This went about six or seven inches down. This was done at intervals of a week. A cutaway disk with 20-inch disks was used twice before May 1st, when the beans were planted. The disk went about 8 inches. Four spike-tooth harrowings finished the job. The beans were cultivated once with narrow shovels.

This season I expect to plow in about two weeks and go a little deeper the first time—otherwise the treatment will be about the same. The great thing we have to guard against

Mechanical Power on the Farm

SUBSOILING MADE 1 1/4 TONS WHEAT PER ACRE.

"The most valuable tool I have on my ranch in Imperial Valley is your five standard subsoil plow. Before using this subsoiler my crops of grain were unsatisfactory, both as to quality and quantity of production. I have the "medium" type of soil and previous to purchasing your subsoiler I disked the land as deeply as possible and seeded and irrigated according to the best farming practice in Imperial Valley, and believed I was getting good results.

"Last season I subsoiled every acre of my land, thereby thoroughly pulverizing and aerating the soil. Then I planted and irrigated as I had done before; the result was marvelous. One piece of land that produced twelve sacks of barley the year previous, yielded twenty-seven sacks of early Baart wheat, weighing 140 pounds to the sack and testing 61 1/2 pounds to the bushel.

"There is no logical argument against subsoiling, but there is every logical argument in its favor. The quality of your materials and workman ship is evidenced by the fact that my subsoiler, after hard usage, is as good as new.

"The Imperial Valley farmer must "shake up" his soil and nothing will do this better than your subsoiler. It is a pleasure to me to recommend this tool to thoughtful progressive farmers."

The letter quoted above was written last September by Robert A. Todd to the Killefer Mfg. Co. Subsoiling for grain is a new practice in the State within the past two or three years; but it is rapidly gaining favor. Of course, very little of it is done with horses or mules—that would require a small regiment of animals, for it frequently requires two of the biggest tractors. The more power subsoiling requires, the greater benefits will be seen after it is done right.

BEWARE OF ELECTRIC LIGHTS IN THE PUMP PIT.

Every once in a while a fatal accident occurs from the use of ordinary electric lamps in damp places. This should be carefully guarded against in the case of electric lamps used in pump pits. While the voltage generally is not high unless some defect has developed in the transformer, the wet conditions in a pit make such good connections with the ground that enough current sometimes passes through a man to kill him. Brass lamp sockets do not withstand moisture. Neither do the thin fiber sheets by which their electrically charged inner shells are insulated from their outer shells. Common lamp cord does not long withstand moisture, and a man with wet feet on a damp floor may come to death through handling the cord where it burns through at the psychological moment. A man standing on a wet concrete floor was recently killed by the point of one of the fine wires which had broken in the lamp cord and punctured its insulation so it came in contact with his hand. Safety is increased by use of rubber boots, wooden handles on the lamps to be carried about, and most of all by use of cords and lamp receptacles designed for moist conditions.

POWER FOR CATTLE RANCH.

As labor becomes harder to keep steadily at work, more ranchers are turning to mechanical power to do various jobs about the place. One such is R. M. Diggs of Monterey county. In a lean-to shed he has a 5 h.p. 220-volt motor hitched to a line shaft. A circular wood saw outside the shed is surrounded by stove wood sawed by power from the lineshaft. Another belt from the lineshaft runs an emery wheel which also is outside. A barley crusher in the shed is run by a belt direct from the motor.

This motor uses 2 3/4 kilowatts of electric energy.

Beside the barn when we called was a No. 26 alfalfa chopper which had half-filled the large hay bay preparatory for the feeding of cattle in sheltered racks on both sides. The latter had been blown in by the chopper and stacked beautifully without any pressure against the building. As each crop of alfalfa was cut, it was added to the stack. The chopper was run by a 25 h.p. motor mounted on a permanent stand beside the barn, but easily demounted to store in the dry when the season's chopping was over. This motor uses about 14 1/2 kilowatts.

The chopper with a self-feeder was mounted on a wagon truck, and a blower pipe with a long-radius elbow was provided to carry the feed as high as necessary and deliver it at the far end of the barn to keep the stack level for its full length.

Mr. Diggs has found by experience that it pays to have feed available on the ranch for his cattle in case of a dry short season on the ranges. That is why he bought the alfalfa land. But with alfalfa at present prices, he figures he must get all there is in it. He is convinced that he can accomplish this object profitably and only by chopping it fine before storage and feeding.

LOW TRACTOR DEPRECIATION AND REPAIRS.

To the Editor: In regard to the article in the November 15 issue about tractors and horses, it sounds too much like an ad for tractors. I may be a tractor man myself later; but \$30 for repairs and overhauling is certainly off the mark on a \$5,000 tractor. Depreciation only \$250—the life of a tractor is eight years instead of 20 years.—G. A. R., Byron.

Sure the average life of a tractor is eight years or less and the average amount of repairs would be nearer \$300 than \$30. But it depends largely on the operator. Mr. Fanoe's tractor is probably better than new at this moment, for it is in good running order, while a new one would have to be worked in. This tractor appears as good as new and we have every reason to believe what Mr. Fanoe told us. He ought to know; for he was the only driver of the machine and he helped the expert to overhaul it. His figures on repairs and depreciation applied only to the first year of use and are out of the ordinary. More troubles and wear may become apparent next year. But these low figures are a fine illustration of what we have been preaching in various ways—depreciation and repairs depend more on the operator than on the tractor or the work it does. A tractor built more than ten years ago has been busy on a farm in the Middle West and was taken from the field to the Wichita demonstration last summer. There it plowed against the best of the others and returned home to get busy on the harvest. There is no telling how much longer this tractor will run, for its operator is evidently taking care of it. Such care takes a great deal less time than would be required for the number of horses the tractor displaces.

TRACTOR FOR MORE WORK OR BETTER WORK.

A prominent Tulare county orange grower claims that operators of tractors in orchards make a bigger mistake in trying to spread out too much with the tools they are pulling than in trying to pull too heavy a load. One of the big reasons for orchard tractors is to secure deep, thorough cultivation. Many persons forget this and do just the same kind of work with tractors that they would with horses, only with greater convenience. For example, in discing this man uses a six-foot double disc, setting it as deep as it will go and loading it down, while lots of other men with the same make of tractor pull an eight-foot disc and set it more shallow. The load on

HAVE YOU SEEN THE NEW

Beeman Tractor

After years of experience this new Beeman has been perfected to meet California conditions. It has an abundance of power. All working parts are specially protected against dust and dirt. It is equipped with tools that successfully work California soil.

Direct Connected Engine Driven Pump

—For Pumping Without Electric Power

A PUMPING unit that practically runs itself. The nearest thing to electric reliability that has ever been developed.

Start it pumping and leave it for other work elsewhere in the field if you wish—it will stay on the job, delivering a large volume of water steadily.

Seven to eight gallons of distillate keeps it running for ten hours without stopping.

Driven by an extra heavy vertical type engine, designed to operate at uniform speed. Governor controls it.

Inexpensive to install. No other direct connected engine driven pumping outfit like it. This is especially designed to meet pumping needs exactly where electric power isn't available or wanted.

Investigate thoroughly before you buy any other kind.

"BEAN" Universal Direct Connected Engine Driven Unit

Bean Spray Pump Co.

211 W. Julian Street, San Jose, Calif.
Branches: Fresno—Los Angeles

Mail coupon for complete description, showing all points wherein this outfit excels.

Don't attach "any" engine to a pump and expect to get good service. Send the coupon and learn how this rig will give you more water at smaller cost.

the tractor is the same. One outfit gets the work done quicker; the other gets it done slower and better. With a very light tool, such as a springtooth cultivator, a much wider cut can be made with just as deep cultivation, as with disc.

AVOID FREEZING IN THE TRACTOR.

A California tractor salesman claims that the radiator of a tractor will not freeze as soon as the pump in one which has a pump water circulation system. He sold new pumps all spring for a certain make of tractor whose pumps had frozen during the winter. Welding did not seem to fix the pumps permanently. Many new cylinders also were sold to replace those bursted by freezing. The worst troubles in this respect were in the cold lowlands. The few tractors in really cold mountain valleys are probably better cared for; but each night the man in the lowlands guesses it won't freeze tonight and then the trouble comes.

The only remedy is prevention, as an Irishman might say it. Drain the cooling system every night. It won't take much time to fill it in the morning.

"Cold Weather Tips."

A folder issued by the Avery Company for free distribution is entitled "Cold Weather Tips." It applies more to eastern winters than to our own; but many a California tractor man would have used his tractor more if he had followed the suggestions below which are taken from the folder.

Drain every night in freezing weather and be sure all parts of the system are drained.

Kerosene can be used instead of water in very cold weather. Mixture of one part denatured alcohol with two parts water and about ten per cent glycerin works well, the glycerin being used to retard evaporation of the alcohol.

A higher-test gasoline for priming will give easier starting on cold mornings.

Lighter oil is not so sticky in the bearings when you work hard to turn the engine over on a cold morning.

Moisture is apt to form on the spark plug points when the machine is idle, and short circuit them when attempting to start the engine. Keep the plugs clean.

Be generous with oil on all inside moving parts when putting the tractor away to stand idle for some time.

HIGH SCHOOL TRACTOR COURSE.

To the Editor: A big tractor demonstration will be held at the Lodi Union High School, December 1 to 13. The equipment will include twelve tractors of different makes, gas engines, farm machinery, and disassembled parts. The value of the equipment demonstrated will approximate \$100,000. The material at the disposal of the students will be studied under supervision of the most competent instructors available in the State.

The schedule of sessions will be during the day from 9 to 12 a. m. and from 1 to 4. Evening sessions will be instructed from 7 to 9.

A small laboratory fee will be charged for the entire course, \$4.00. The fee is merely to defray local expense.

The importance of the tractor work in California is evident in the fact that many of the dealers cannot keep the demand supplied. More and more machinery is taking the place of hand labor. Skilled operators are not sufficient to operate the number of tractors in the field today. It is the purpose of this center through the large corps of service men and qualified instructors to put over practical information regarding the maintenance of tractors and farm machinery.

The center is heartily supported and endorsed by the State Board of Education, by the University of California, the Lodi Business Men's Association and the Farm Bureau and Farms of the district.—H. W. Shepherd, Director of Agriculture.

Plow dry; for you can't plow wet in time.

LaCrosse TRACTOR

\$1450 Cut to \$1195

WE are pleased to announce that in spite of rising costs the production of the La Crosse Tractor has become so standardized that we offer a reduction of \$255 from the former price of \$1450.

We have been allotted a limited number for distribution at the remarkably low price of \$1195. This is the standard Model G three-plow tractor, rated at a full 2,000 pounds drawbar pull. With its perfect kerosene burner and its own twin cylinder horizontal motor it holds many records for low fuel cost and dependability.

The price of \$1195 is for the tractor complete with belt pulley, fenders and governor ready for work.

It has the fewest number of parts and every part is very accessible. There are thousands of these tractors being used successfully under many different conditions.

If you ever intend to have a tractor here is your opportunity to get a dependable three-plow tractor at a price only made possible by standardized quantity production.

During the next two weeks we will be increasing our number of dealers. If we do not have an agent in your community, and you know a live dealer who wishes to build a permanent tractor business on a proven success, urge him to write us at once.

Even though the production on this standard model will be more than doubled in 1920, the factory cannot promise delivery beyond present allotments.

A Champion from a Champion

(Written for Pacific Rural Press.)

Sometimes a cow may be a great producer of milk and butter, but never has a calf that is a show animal, but in the case of this grand champion bull of the Holstein-Friesian breed at the California International, King Morco Alcartra is a son of Tilly Alcartra,

strong competition, is Segis Pontiac De Kol Burke, that is considered one of the premier sires of the Pacific Coast. The grandam on the sire's side is Riverside Sadie De Kol Burke, whose milk records for all periods stood for a long time as world's rec-

King Morco Alcartra, grand champion Holstein-Friesian bull at the California International, 1919. Owned by A. W. Morris & Sons Corp., Woodland.

the greatest cow in the world from the milk-and-butter standpoint combined. Her record is so well known and published so often that it is not necessary to repeat it here.

The sire of this bull, that is not only famous from reflected glory, but also from honors of the very highest kind won in the show ring in very

ords. It will be seen from this that this bull's two nearest dams have yearly records averaging 31,126 lbs. of milk, yielding 1204 lbs. of butter. This could be carried on throughout all the records of these two cows, making most wonderful combinations. Suffice to say, this fellow is a really wonderful individual, and bred "in the purple," if there ever was one.

BEANS FOR SWINE.

To the Editor: Will you kindly give me some information regarding the food value of small white and pink beans for hogs? What is the best method of feeding—cooked, soaked or ground? How do they compare in food value with barley and wheat?—F. W. McN., Pozo.

(Answered by Livestock Editor.)

It is a very hard matter to get hogs to eat raw beans. An agent for stock molasses from sugar cane claims that beans ground and mixed with molasses are readily eaten by hogs and that they thrive on it. Experiment alone will determine the value of this. Thoroughly cooked beans make good hog feed, although a rather narrow ration, the protein content being high. The molasses is an excellent addition to the cooked beans, making them more palatable and balancing the ration. Compared with wheat and barley, which are nearly alike in actual feeding value, the small white or navy bean contains about 8 per cent less digestible nutrients than the wheat and barley. The tepary and Mexican frijole, the last a red bean, contain only about 4 per cent less digestible nutrients. The beans, however, are higher in their protein content and will produce a larger percentage of lean meat in the dressed carcass if fed alone, or are better builders of bone and muscle in the young animal. They are not as palatable and therefore, unless fed in combination with some other feed like molasses or barley or wheat, will not produce as good results and rapid gains.

HARD MILKER.

To the Editor: We have a cow that is very hard to milk. She is 6 years old, has had three calves, and is a good milker. Can anything be done that will make her an easy milker?—Mrs. D. L. T., East Bakersfield.

(Answered by Livestock Editor.)

This trouble is very hard, almost impossible to overcome. There are dilators put out by some of the mail order and dairy supply houses which in some cases help for a time. The results generally are negative, however, in the end with the animal in the same condition as when starting treat-

ment. The application of a small amount of vaseline to the teats a short time before milking has been recommended by one correspondent who thinks it a great assistance.

LIVESTOCK GLEANINGS.

The wool market is not in as promising condition as it has been for the past two or three years. Wool growers about Byron are hoping for better prices, and are holding for a rise.

It appears that it is the plan to ship 40,000 bales of Australian and 10,000 bales of New Zealand wool to Boston for sale in December, and 30,000 bales monthly after this if it seems advisable.

Alfalfa hay around Orland, Glenn County, is very scarce, due to over-selling by farmers to the alfalfa meal mills. Over 4,000 tons of alfalfa have been ground by the mills at this point alone. It would seem to the outsider that more of this alfalfa should be fed to stock, and Orland work up even a greater fame as a live stock center.

Manufacturers used about 60,000,000 pounds of wool, grease equivalent, in September, 1919, which represents the second largest monthly consumption during 1919, the figures for July, 1919, being 63,000,000 pounds, grease equivalent. The September totals exceed those of the same month last year by 2,000,000 pounds, and then the mills were all busy on war contracts.

It is said that large doses of stock molasses diluted with water will prevent the formation of prussic acid in a steer's stomach if he has eaten too much frost bitten second growth sorghum. This must be administered before much absorption has taken place. It sometimes happens that a bunch of cattle have been turned in on a piece of second growth sorghum and perhaps one or two have already died, then it would be a good thing to administer large doses of the diluted molasses to those that are not yet down. It certainly would do no harm, and might save several cattle.

H. H. Gable, who won first on carlot of steers, bred them on his range just a few miles north and west of Esparto. Any one that has seen his

range herd will not be surprised at his winning. Mr. Gable started his range herd on grade Herefords 15 years ago, and has used nothing but the best purebred sires since, until his grade herd to all intents, purposes, and appearance, is purebred. His pure bred herd is a most excellent one as well, and he has made several recent additions of females that keeps him in the line of progressive breeders. Not content with this, he is off on a tour of the eastern big shows and farms. He will visit the American Royal at Kansas City, and the Chicago International before he returns.

Things seem to be coming Mr. Gable's way, as he won the pool on the average at the recent Hereford sale at the California International with a guess of \$710 when the actual average was \$711.

PACIFIC RURAL PRESS
525 Market St., San Francisco.

The Ninth Pacific International a Success

(Written for Pacific Rural Press.)

The opening of this great show was marked by the dedication of the magnificent new three hundred thousand dollar stock pavilion. Frank Brown, president of the Pacific International Livestock Exposition, accepted the building on the behalf of the stock breeders of the Pacific Northwest. Many prominent men from all parts of that great region, from the Inland Empire to the Pacific Coast, took part in the exercises and eulogized the founders of this great enterprise devoted to the exhibition of livestock and promotion of the industry. This building is said to be the largest stock show pavilion, and is one of the largest buildings under one roof in the world, and covers fully 7½ acres of ground.

One thing was particularly noticeable, and that was that the concessionaires were not profiteers, as the patrons could eat just as cheaply as in the downtown restaurants.

Judging commenced Tuesday morning on the fat classes. Day and Rothrock of Spokane, Washington, had grand champion steer of the show. The best pen of fattened hogs, light, was won by Herbert Willard of Dayton, Oregon, on three Poland-Chinas. The heavy pen of three went to Ray J. Fox of Lyons, Oregon, on Poland-Chinas. The champion carload of fat steers went to Ed. W. Coles of Haines, Oregon, on Herefords.

California exhibitors were strong in the Milking Shorthorn classes. Thos. Harrison of Santa Rosa, winning first on bull 1 year old, first on heifer 2 years old, first on junior yearling heifer, first on senior heifer calf, second on aged bull, and bull under 1 year, with numerous other awards. Alexander & Kellogg of Suisun, won first on bull 2 years old, aged cow, and senior yearling heifer, second on heifer 2 years old, junior yearling heifer, and senior heifer calf, with other awards.

In the beef Shorthorn classes Little Sweetheart continued her grand championship winnings. This certainly places her at the head of the Shorthorn females west of the Rocky Mountains, and some of the best judges think she is the premier female of the continent today. Mr. Glide purchased her last spring from the Ormondale Company of Redwood City. Mr. Glide also won first on his 2-year-old bull, Matchless Elite, first on aged cows, with Spicy Lady, and first on aged herd. Thos. B. Dibblee Estate were not in the blue, but made a very good showing, getting third with Hallwood Flash in the aged class with six competitors, and third on Bashan Augusta in the senior yearling bull class of eight. In the females they stood about the same in larger classes. It was truly a great Shorthorn showing.

The Hereford exhibit was large, even more extensive than the Shorthorn show. Cattle from 19 different herds from all over the Northwest, and some further east, made a great showing.

Aberdeen-Angus were in the minority, as Congdon & Battles of Yakima, and State College of Washington, were all of the exhibitors. It would seem as though beef cattle of as much merit as the "doddies" should have a larger representation.

The swine exhibit was extensive, and as good as it was large, including Berkshires, Chester Whites, Duroc-Jerseys, Hampshires, and Poland-Chinas. Hampshires and Duroc-Jerseys were represented by herds from Lincoln, Nebraska, owned by Roy E. Fisher, who has been making a circuit of the late fall shows on the Coast.

Holstein-Friesians, Jerseys, and Ayrshires were all well represented, making an exhibit second only to that at the National Dairy Show, it is said. It tells the story of what is being done in dairy lines in the Northwest.

The auction sale prices obtained for the reserve grand champion steer, the grand champion barrow, and the reserve grand champion wether, were

almost sensational even in this day of high prices. The steer weighed 1240 pounds and sold for \$56 per cwt., with a total of \$694.40. The barrow weighed 400 lbs. and sold for \$50 per cwt., bringing \$200.00. The wether weighed 210 lbs. and sold for \$28 per cwt., a total of \$58.80. Sales of other prize winners were excellent, and most of them brought big money.

The Pacific International has added more luster to its already excellent reputation as a livestock show, and like the Chicago International can now go forward from year to year, executing still greater deeds in livestock promotion.

CHEESE VANQUISHED BY CONDENSED MILK.

(Written for Pacific Rural Press.)

Cheese has been vanquished by condensed milk in the Coburn district of central Kings county. A new factory is being finished as an expansion of the cheese factory, formerly operated here by the present owners, Switzer and Meynberg. Machinery, building materials, and labor for the new outfit have cost between \$80,000 and \$90,000 according to Esmond C. Switzer, senior member of the firm. They were receiving about 75,000 pounds of milk per day when we called at the factory recently. This was being sold for whole milk until the new machinery should be installed by the last of November. After that, the plans are to convert about half of it into malted milk, part may be condensed, and part will make dry powdered milk. Mr. Switzer claims to be one of the originators of the latter product, which has been in use about twelve years. High prices and bonuses paid to dairy-

men by the Alpine factory, took milk away from the cheese factory. The September price was \$3.26 for milk.

FINE CALVES

Without milk after the fourth week is now practical. AN-FO Calf Meal in water nourishes calves properly. No scours or pot bellies. Raises Sturdy Calves. Feed Dealers, or Animal Food Co., Oakland, supply.

The Eye of the Master Fattens His Cattle

(Written for Pacific Rural Press by Thos. F. McConnell.)

The above heading is taken from the title page of "Feeds and Feeding," that well-known work on these subjects. It is an old adage or saying, originating in the ages past in Europe, used by Prof. W. A. Henry, of the Wisconsin College of Agriculture, in years gone by in his lectures to agricultural students. Prof. Henry, while the greatest of scientific feeders, was nothing if not practical, and did not fail to impress it upon the minds of his students that it was necessary in order to get maximum results from the minimum amount of feed, that the business of feeding stock could not all be done from a distance. In other words, no matter how scientific a ration may be figured out, and no matter how generous the supply of feed, if there is not personal supervision by a competent person in all feeding operations, they are in 95 per cent of the cases found to show a balance on the wrong side of the ledger in the end.

The question may be asked, if this applies to all kinds of live stock? The answer is, yes, from the one lone pig or lamb in a pen to the wildest steer on the widest range. Feeding stock is not sitting in an office chair after a course (long or short) in an agricultural college, and figuring out an exact ration, and then supplying the requisite amount of the different kinds of feed to incompetent persons to place before the animals. Successful feeding cannot be done by just dumping the feed down before the pig or cow or sheep, as the case may be, without any other attention.

Selection.

How, then, may "the eye of the master" be applied to secure the maximum results so much desired? First and foremost in procuring animals, either lamb, pig, steer or cow, that will respond to proper treatment. The best feeders of meat-producing animals select those that correspond to a certain type that is universally acknowledged to be the best. It makes no difference really what breed characteristics in the way of color, head, or horn, they may possess, only have them all alike, as uniformity is really one of the leading essentials when they come to be placed on the market. In the dairy herd it is not necessary to pay much attention to the color of the cow as it is to the color of the milk, especially if the blue color is avoided. Cows of high production, as indicated by their records in a cow-testing association, or otherwise, should be selected. Heifer calves from high-producing dams, rather than those about which nothing is known. In other words, buy or raise the best.

The animal husbandman, and all those who make a success of caring for farm animals are entitled to the name, sees to it, after he has his herd or flock selected, that their environment is what it should be. It is not meant by this that expensive buildings are needful, but that they should be adapted to the use to which they are put.

Water.

An abundance of clean, pure water is one of the leading essentials which "the eye of the master" will see is provided. This should be abundant at all times of the year. A water supply that is plentiful during nine months of autumn, winter and spring, may fail entirely during the summer when the stock need it most. All know how the older and stronger animals in large herds will prevent the younger and weaker ones from drinking even after the leaders have slaked their thirst, therefore he will provide places where these weaker ones may drink undisturbed. In late years in the best-cared-for herds this trouble has been eliminated by modern equipment and segregation of the younger animals. Sheep are not so bad about preventing one another from drinking as cattle, for as soon as they are through drinking they step back if the place is crowded, and others take their places.

The qualification of clean water is not overlooked by the "master." Where running water is possible, the

source should be fenced to prevent trampling and wallowing with consequent excrement contamination. The spring water should be conducted into troughs, preferably of concrete or galvanized iron, as in the end they are the cheapest, the overflow to be carried away to eliminate mud holes. Have the watering places in the shade if possible.

Feed.

This is a magician's potion in the hands of the "master." Sometimes feeders are at a loss where to obtain the knowledge they desire when five minutes use of a pen or pencil and a two-cent stamp will bring the information. The U. S. Department of Agriculture publishes "Farmers' Bulletins" bearing upon almost every phase of agriculture and livestock raising. Unlimited information may be obtained by writing or visiting the California Experiment Station, Berkeley, or the University Farm, Davis. Last, but not least, the Pacific Rural Press is always ready to answer questions by its readers through its columns.

If the herd or flock is small much more attention can be paid to individuals than if it is large. When cattle are fed in stanchions they are usually taught to take the same place every time, and it is astonishing, to those not familiar with the fact, how quickly each one comes to know its place and go directly to it. When this is done it is easy for the feeder to see if each animal is eating its portion up clean, also just how quickly each one cleans up its portion, and if, like Oliver Twist, it asks for "more." Here the natural caretaker will notice a lack or an excess by the actions of the individual animal. These conditions are found mostly in dairy herds in both small and large lots. If the feeder is not observing, and an animal does not clean up its portion, two things may happen. The animal may "go off its" feed and loss of production follow. The excess of feed left in the manger may sour and rot causing an unclean condition to obtain, that becomes repugnant to the animal, and even less feed be eaten than would be if just the right amount was fed. It also may cause digestive troubles that will take some time to overcome. The expert coming into a herd will notice lack of condition in such individuals at once.

It is such conditions as these where the "eye of the master" corrects trouble in its incipency and "fattens his cattle." The expert cannot help but notice unfavorable symptoms in an animal as soon as his eye strikes the individual. Condition of the coat in cattle, the position in which the animal stands and where it stands. If standing off by itself, in case of cattle or sheep, it may be all right, but if not chewing its cud and standing in an uneasy, not restful, attitude, it is better to investigate at once and see what is wrong. In other words the expert becomes very familiar with the normal, healthy appearance of his stock, the way in which they stand and walk, the way in which they eat and drink, the way they act when turned out of a corral or stable. Becoming very familiar with the normal condition, anything abnormal strikes the eye at once and correction of the difficulty is begun at once.

Cruelty.

The true live stock man is always on the lookout for evidence of cruelty towards dumb animals on the part of those caring for them. The animal that has been beaten or clubbed will indicate it immediately by shrinking upon approach when tied or fastened, and running away if loose in corral or field. This is a condition that should be guarded against for two reasons: first, for humanity's sake, and second, because it is unprofitable in all classes of livestock to have them in a constant condition of fear upon the approach of a human being.

Disease.

Indications of such are very patent to the eye of an expert, especially all acute cases. Injuries are noticeable, of course, to almost every one at once,

JERSEYS

The Cows for the Working Farmer

Always on the job to produce for profit, not to run up excessive feed bills—that's Jerseys! You feed a Jersey for her udder. She can make a dollar's worth of feed go farther and yield a greater return than any other breed. Her milk averages 6.37% butter fat. The market pays more for Jersey milk, Jersey butter, and Jersey cheese. If you want "Fidei-Præ" Profit cows, don't hesitate—get Jerseys. Let us send you "Profitable Facts about Jerseys." It is a free booklet with hundreds of valuable points and information.

but it is astonishing how great an injury will pass unnoticed by the ordinary caretaker at times. If an animal is seen to be limping, even slightly, the cause should be determined at once as cloven-footed beasts sometimes get a stone or stick wedged between the hoofs, a hoof broken or grown out too long, all of which can

THE BEST BRED HOLSTEINS MORRIS EVER SOLD

Fire destroyed the big cow barn, the season's hay crop, all of the mill feed, and four silos on the A. W. Morris & Sons farm at Woodland, early in November. They must therefore reduce the size of their herd and have instructed us to sell at public auction.

70 ROYALLY BRED YOUNG COWS AND BULLS STATE FAIR GROUNDS, SACRAMENTO, CALIF.

THURSDAY, DECEMBER 18, 1919

After analyzing the sale list we state positively that this is the best bred lot of registered Holsteins that have ever left the Morris herd in so large a group. These cattle are practically all bred in the lines that are making history in Holstein production in the Morris herd today, including many that would not be offered for sale under any circumstances except for the suddenly created necessity for selling.

Automatic Conditioner

For All Live Stock

Take It Home

Try It 60 Days

At Our Risk

Carey-ized

Stock Tonic Block and Brick

Why not reduce the risk of live stock raising and increase your profits—make surer of the health and rapid growth of your live stock, since you can do so without taking chances? Many successful farmers have increased their live stock profits by taking advantage of our 60-day trial offer and have proven, without risk to themselves, the great value of Carey-ized Stock Tonic Block and Brick for stopping losses by worms and warding off every disease.

Our 60-Day Trial Offer Is Open to You

To get the benefit of this offer you do not have to sign anything or obligate yourself in any way. Just ask the dealer in your town for a sufficient quantity of Carey-ized Tonic for a fair 60-day trial. Feed it according to directions, and if you are not entirely satisfied with the result, we will refund all your money. Your dealer or your banker will tell you we are responsible.

Carey-ized Stock Tonic Block and Brick is a time-tried, proven, dependable worm destroyer and conditioner for all live stock. Contains all the mineral salts which animals need, and craves every day, including bi-carbonate of soda, sulphate of iron, sulphur, gentian root, quassia, carbonized peat, charcoal and pure dairy salt.

Put up in 50-lb. Blocks and 3-lb. Bricks for convenient feeding. Animals partake of it as nature dictates—a little at a time—keep themselves free from worms and in thrifty condition without bother to you—no dosing, no drenching, no overdosing, no waste.

Sold by grocers, general stores, druggists, feed and hardware dealers—50-lb. Blocks \$3.25; two 12-lb. cartons (70 lbs.) \$5.80. Order enough from your dealer for a fair 60-day test with all your live stock. If he can not supply you, send us his name (no money) and we will send him the tonic for you; or if you prefer, send us the amount for the quantity you need and we will ship it to you direct, freight collect.

Remember, our 60-day trial offer means that we take all the risk of a fair trial by you. We could not make this offer if we were not sure that in 60 days' feeding according to directions you will be entirely satisfied with the result. Fill out and mail us the coupon for free illustrated literature, or for a trial order of the tonic under our satisfaction guarantee offer.

be corrected many times with very little trouble if taken in time.

Parasites.

Parasitic troubles, like lice on hogs and cattle, scab on sheep, should be and are prevented from obtaining a foot hold where the "eye of the master" is looking after his animals. The real master never allows such things to make their presence known on his animals, but if for any reason he should be away for a time and the stock neglected during that interval, he will notice it immediately upon his return. No one not acquainted with the matter knows how much injury the different forms of parasites do to farm animals, especially swine and sheep. These parasites are all blood-suckers and cause loss both by actual consumption of blood and by irritation and distraction of the animal from its regular business of growing meat and wool. It costs far less to keep them out than it does to feed them.

"I've saved enough time since
I installed a

LOUDEN Litter Carrier

To Pay For It
3 Times Over!"

That's what one dairy farmer recently told us. And time is not the only factor in cleaning a barn. Shoveling manure every day requires man-power and means labor. A Louden Carrier will save the labor of at least one man. Makes barn cleaning easier, cuts labor, cuts cost.

Large as Well as Small Numbers.

It may be thought by some that these precautions apply only to the small operator; it applies in all phases of the livestock business from the pig club boy or girl to the largest feeders and dairymen. The feeder of small lots, or the dairyman with a few cows, know their individuals better. The feeder of large lots of steers or sheep watches out for those that are smaller and weaker, and cuts them out from the rest of the bunch, and places them by themselves where they are all of the same size and condition, and can be given feed better suited to their condition or at least get "what is coming to them."

Swine breeders, in speaking of litters of pigs, say "there is always a small one." It is more or less true, but why is it so? Because in some way somewhere that little mite of life was not getting "what was coming to it." Coming into the world in this condition it is handicapped in the struggle for existence, and unless the "eye of the master" sees to it that it is assisted in this struggle, it will always be a runt. Nine times out of ten the runt can be made into as good a pig as any if proper attention is given it.

Range as Well as Ranch.

The proper observance of detail and conditions of animals shows as much or more in cattle and sheep from the range as from the farm. The packing houses are looking for animals that will slaughter well and are not all hide, horns, and hoofs, like the old Mexican or Texas "longhorn." The "eye of the master" is seeing that more purebred sires are used in the herds of cattle and flocks of sheep all over the great Southwest. This attention to the breeding alone is one great result of expert supervision.

The man who knows that the water-holes are looked after, seeing that weak and crippled ones are cared for, when the feed is getting short and the thousand and one details of range life will have the best bunch of steers or the best flock of lambs to ship to market when the time comes. If it is all left to the man who is interested more in whether the country is going to stay "wet" than he is in the welfare of the animals under his care, the results will not be what they should, and the shipment second-rate rather than first-class.

In closing, the writer remembers some 20 years ago, when Frank W. Harding, now Secretary of the American Shorthorn Association, was in active management of Anoka Farms at Waukesha, Wisconsin, he accepted a student from the Short Course of the Wisconsin College of Agriculture to work on the farm. This student wanted to learn the business of breeding, and feeding purebred cattle. When he commenced work on the farm, much to his surprise it was not with the cattle but out in the field with a team and harrow. A day or two of this work and he approached Mr. Harding to find out when he was to go to work with the cattle, but was told there was no vacancy in that line, and that he would have to wait until he knew more about raising the reed before he would be allowed to take up the work of feeding. Another day of following the harrow and the student made another application to be permitted to feed the Shorthorns, suggesting to Mr. Harding that he give the applicant a list of the cattle to be fed each one, but the student was informed that it was not possible to feed cattle that way. Mr. Harding further impressed this fact on the man's mind by telling him that his herdsman knew each individual in the herd, and about how much it would eat. That he was watching each one to see that it did not get too much, and still enough to produce maximum growth. Making it clear to the student (who by the way was a New York City man) that cattle could not be fed entirely by the scales and measure, but judgment, backed by long experience and observation, was necessary to successfully feed and care for a herd of cattle. The student could not see it that way, and was not willing to commence at the bottom of the ladder and gave it up as a bad job.

DE LAVAL

the world's standard CREAM SEPARATOR

"It is so
much easier
than the old
way."

In these times of high butter prices and scarcity of labor, no housewife should bother with the old-fashioned gravity method of skimming milk. The De Laval Separator will recover one-fourth more cream and do it with less work and in shorter time.

Neither is there any excuse for struggling with a half-worn-out or inferior separator that wastes cream and is hard to turn and difficult to wash. The work can be done much better, quicker and easier with the De Laval—the world's standard separator.

By purchasing a De Laval now, it will have paid
for itself by spring

Dairy.

The famous Holstein-Friesian bull, King Segis Pontiac Alcartra died recently. He was valued at \$50,000 and owned by Jno. H. Arfman, of Fairmont Farm, Middletown, N. Y.

H. L. & E. H. Murphy, owners of Brighton Farms, Perkins, have sold to Leon F. Douglas, owner of "The Pocket Ranch" at Geyserville, 6 milking Shorthorn heifers of excellent type and breeding.

Ralph E. Watson of the Henderson Company, Sacramento, reports the cow, Lottie Walker Spofford 3rd, as progressing at a 32 lb. rate in a 7 day test as a 6 year old. Queen Pontiac Calypso, at the same ranch, has just completed a 25.5 lb., 7 day record as a junior 3 year old.

U. S. Department of Agriculture announces that despite the high price of butter, consumers continue to be defrauded by butter containing an excess of water and salt. Several lots of inferior butter have been seized recently.

The cow testing association of Sacramento County is proving a very valuable institution for the dairy industry in that region. More pure-bred bulls were sold to owners of grade herds the past year than in two years previous. Membership in the association has increased over 100 per cent in the past 12 months. To Messrs. Watson and Green is due much credit for the success of this association.

It is interesting to all dairymen and to Holstein-Friesian breeders in particular, to know that of the seven cows of this breed that have produced over thirty thousand pounds of milk in a year, four of them are owned and have made their records in California. They are as follows:

Tilly Alcartra, 30,451 lbs. at 5 years old, and 33,425 lbs at 9 years of age, California.

Luttske Vale Cornucopia, 31,469 lbs., Washington.

Winnie Korndyke Cornucopia De Kol, 31,340 lbs., California.

Raphaella Johanna Aaggie 3rd, 30,637 lbs., California.

Queen Piebe Mercedes, 30,230 lbs., Minnesota.

Lindale Bonnie Pauline, 30,024 lbs., Ohio.

Ormsby Segis Marie, 30,249 lbs., California.

The disposition of skim milk was one of the chief topics discussed last week at the "Creamery Operators' Convention" at Davis. President Gray, of the California Central Creameries,

gave some statistics on the subject and told how 9 per cent of skim milk is protein nutrients. A market for a large proportion of this can be found in the form of the dried product, but there is danger of flooding the market if it was all put up in this form.

The Lucerne Cream & Butter Company of Hanford, announces new records for October in both production and pay roll. The amount paid to dairymen of the district was \$98,170.08. The output of butter for October, 1919, was 59,900 lbs. greater than in October, 1918. This is certainly a prosperous appearing statement.

The Henderson Company of Sacramento, breeders of Holsteins, reports through their manager, Ralph E. Watson, the sale of 7 bulls during the past 30 days at very attractive prices. During the past year the business has been excellent, and demand increasing rapidly. They now have 30 excellent daughters of their senior herd sire, "King of the Blacks and Whites."

A. W. Morris & Sons Corporation, the Holstein breeders of Woodland, will have a one-day sale on December 18th of 65 head of top-notch cattle, instead of a two-day sale of 125 head. Jack Shillcock, the well-known eastern fitter and ring man of Holsteins, has been engaged to take charge of the sale stock and have them "fit as a fiddle" by sales day.

Miss Aaggie Acme Burke, A. W. Morris & Sons' new state record, two-year old, with 20.10 lbs. butter to her credit 8 months after calving, is the dam of the bull calf, King Korndyke Acme, which was second in his class at the California International, and would have been first had not another calf from the same herd been entered that took first. This heifer is still milking around 65 lbs. daily at 9 months after calving.

Swine.

Les McCracken has bought the sows and gilts from J. H. Cook of Paradise, that the latter intended to put in a sale shortly after the first of the year.

J. F. Lehman of Lodi reports the sale of a litter mate of the grand champion Golden West King at the California International, to J. W. Wakefield of Acampo.

Wednesday, December 3d, the Boys' Pig clubs of Fresno County will hold a sale of 45 purebred animals, most of which are Poland-Chinas. The stock consists of bred sows and gilts, open gilts and boars. All animals have been selected with care so that those wishing to purchase hogs of this kind should attend.

W. I. Young, prominent Poland-China breeder of Lodi, has sold Black Beauty 5th, junior champion Poland-China sow at Sacramento, 1918, to N. K. Horan of Lockeford. Mr. Young also sold the boar, Golden State King, to Mr. Horan, but reserved a breeding privilege. Other sales reported by Mr. Young are 3 gilts to J. C. Benson of Acampo; 1 boar and 2 gilts to Mrs. Cora Hoag of Acampo.

F. E. Crowell of Alpaugh will add another pedigreed hog herd to the growing number in Tulare County, and will introduce the Berkshire breed in that section. At the California International he bought a 21 months old boar of the famous Epochal strain for a herd leader from J. Francis O'Conner of the Castle View ranch of Santa Rosa. At the sale of his stocker and feeder herd, 575 head, including a large number of pigs, sold for \$5,000 last week.

One of the profitable instances of Pig Club results is that of the Webber brother and sister at Yuba City. At a Berkshire sale sometime ago, each of the children bought a sow pig 2 months old for \$15.00. These pigs were consigned by the Anchorage Farms at Orland. They were bred late and both farrowed good litters. After the pigs were weaned, one sow sold for \$125 and also a pig from one of the litters for \$60 shortly after

weaning. The brother and sister have paid the original investment with interest, breeding fees, feed, and all expenses, and have a good start in the care for the pigs outside of school swine raising business. The children hours.

Joe Chinoweth of Visalia seems to be as active as ever in selling "Red Hogs," as he is always sold out. He seems to raise the Duroc type that his neighbors want, and has an excellent home trade.

Frank Schofield writes that he is very much pleased with "Buster the Great," recently purchased from Buckland & Son of Fresno. He is a big type of Poland-China of very fashionable breeding.

Officers of the Tulare County Poland China Breeders' Association have decided to hold a breeders banquet on

the night of February 5 in the interests of the Poland China strain. The day following the banquet the association will hold a consignment sale of sixty head of pedigreed open and bred gilts at the sales pavilion of the Tulare County Live Stock Association at Tulare.

A consignment sale of sixty head of bred gilts will be held at the sales pavilion in Tulare February 13 by the Tulare County Duroc-Jersey Breeders' Association, at which sixty head of bred and open gilts will be offered at auction. All of the bred gilts to be entered will have been bred to prize winning boars in the state.

Fulgham & Son, of Visalia, have plans and specifications already for 25 pen farrowing barn for their Duroc-Jersey sows. Also a barn to house the Polled Hereford herd, which

JOHNSON'S DEFENDER JR.

Owned by GREENWOOD FARM, Live Oak, Cal.

Is California's greatest representative of Defenders, the greatest Duroc family. At the State Fair he was the smoothest boar shown, weighing 700 pounds at 17 months and carrying it on a perfect set of feet and legs. He won second in the strongest class of boars ever shown on the Coast and was a popular favorite. Three of his brothers won ribbons in the same class, showing the strength of this line of breeding.

Five Ribbons Won on Five Entries.

H. C. WITHEROW, Mgr.

LIVE OAK, Sutter Co., Cal.

they have started, including a few excellent females of very desirable type from the herds of J. A. Newell & Son, Kansas; H. J. Harte & Son, Missouri, and P. J. Yennie, Missouri. To breed to these heifers they have a senior yearling bull from the herd of D. O. Eddy of South Dakota. These herds of Durocs and Herefords will be heard from in the future as they are in a very desirable location, and have plenty of alfalfa and other feed.

Beef.

C. Harold Hopkins, of the Conaway Ranch, has some of the very best Shorthorns obtainable anywhere, and will select some more of the same class at the Chicago International.

The Mount Diablo Stock Farm have sold Easton & Ward, owners of the Blackhawk Stock Farm, their entire herd, Aberdeen-Angus heifers consisting of 55 head. The Mount Diablo people from now on will breed nothing but Polled Hereford cattle and Duroc-Jersey swine. Mr. Peterson, manager of the last named farm, will go east this winter to bring out several carloads of Herefords and Durocs.

Harvey Raymond of the Hawaiian Islands, who has been buying purebred Herefords in the central states, this week shipped from San Francisco 20 head of bulls and heifers to his ranch on the island of Maui. The stock is of Anxiety and Mischief breeding.

Sheep.

The farmer is between the devil and the deep sea as the unions are urging them to raise more grain and stock which would naturally bring less money, while on the other hand the unions want shorter hours and higher wages, which means higher costs of all factory products which the farmer buys.

The Klamath County Wool Growers' Association has been active in trying to prevent the importation and sale of Australian wool, but it seems that the only agency able to prevent this would be the war trade board, now a part of the State Department. As long as a state of war only exists technically, the State Department can not see its way clear to exercise any such authority.

Japan is about to make an effort to break into the sheep and wool growing game. Dr. Issa Tanimura of Tokio is now in this country investigating the business. According to Dr. Tanimura there are less than 4,000 sheep in all Japan, and the Doctor thinks that the climate and conditions of his country are similar to those of England, than which there are no better in the world for sheep growing of the mutton variety.

That young folks can win prizes with the animals they care for and feed is proven by the fact that Loraine Modlin, a 7-year old girl of New Castle, Indiana, cleaned up the boys and girls classes in two Indiana county fairs this year. She fed an Aberdeen-Angus calf and exhibited it at three county fairs, winning first at the New Castle and Wayne county fairs and second at the Madison county fair. The money won amounted to \$126. Competition was strong in all classes.

Fresno's Second Poland-China Sale

The Fresno County Poland-China Breeders' Association second consignment sale was a success. Whether it was not just the right time, or what was the trouble, no one seems to know, but the sale was not as snappy as some earlier sales this fall. Charles Gatewood had the top of the sale in an excellent Blue Valley sow, Blue Valley Lady B, granddaughter of old Blue Valley. A. Buckland & Son's bred gilt, Ruby's Daughter, brought \$225.00, which was not what she is worth, and the successful bidders, Wasson & Sherwood of Sanger secured a bargain. A Kings county bred gilt, owned by Walter C. Ficklin, and bred to Fresno Evolution, was secured by the veteran breeders, M. & A. L. Bassett of Hanford. They also secured a bargain in that they will have some of the first of this great young boar's get. The sale was a success, but not as high prices were realized as many desired. Col. George W. Bell of Tulare cried the sale.

A. Buckland & Son, consignment, Fresno—Fresno's Best, H. Barkema, Fresno, boar, \$40; Lady Buster, J. W. Jones, Carruthers, sow, \$115; Littermate, J. W. Jones, Carruthers, sow, \$75; Buster R. Z. M. Dickey, Dinuba, boar, \$55; Ruby's Daughter, Wasson & Sherwood, Sanger, sow, \$225.

W. O. Ficklin, consignment, Fresno—Hadley's Beauty, M. & A. Bassett, Hanford, sow, \$165; Young Beauty, M. M. Dyer, Chowchilla, sow, \$60; Fresno Belle, J. A. Crawshaw, Hanford, sow, \$50; Wonder's Model, E. S. Myers, Riverdale, sow, \$32.50; Madera Giantess, C. E. Dack, Fresno, sow, \$55.

Thos. Caesar & Son, consignment, Reedley—Gertrude B, H. D. McCune, Lemoore, sow, \$75;

Model's Queen 2d, Tom Lobastalt, Kerman, sow, \$80; Elegant Maid, Joe Dolechal, Chowchilla, sow, \$92.50.

D. H. Forney, consignment, Fresno—Raisin City Sunshine, Z. M. Dickey, Dinuba, sow, \$45; Forney's Perfection, Les McCracken, Ripon, sow, \$80; Raisin City Queen, Les McCracken, Ripon, sow, \$80; Raisin City Bill, Tom Lobastalt, Kerman, boar, \$35.

Chas. Gatewood, consignment, Fresno—Blue Valley Lady B, J. H. Rogers, Chowchilla, sow, \$300; Fresno Leader, Mrs. Annie Donders, Fresno, boar, \$65; Black Bob, C. B. McNeil, \$105.

Ira L. Mason, consignment, Fowler—The Princess, Carl Carlson, Reedley, sow, \$40; Queen's Beauty, A. Noyes, Fresno, sow, \$40; Hadley Boy, Perry Beauchamp, Kerman, boar, \$35.

C. E. Dack, consignment, Fresno—Collie Boy, C. A. Slater, Tranquillity, boar, \$55; The Collegian, W. A. Snelson, Chowchilla, boar, \$35.

Vern Fullerton, consignment, Selma—Miss Lady Giantess, Z. M. Dickey, Dinuba, sow, \$55; Miss Lucerne 2d, Z. M. Dickey, Dinuba, sow, \$60.

Carl W. McCollister, consignment, Fresno—Isabel's Favorite, W. C. Ficklin, Fresno, sow, \$40; Valley Queen, J. W. Jones, Carruthers, sow, \$55.

E. R. Eichner, consignment, Selma—Peggie's Favorite, A. Buckland & Son, Fresno, sow, \$85; Jumbo Rosette, Thos. Caesar & Son, Reedley, sow, \$135.

E. S. Meyers, consignment, Riverdale—Viola, J. H. Rogers, Chowchilla, sow, \$125; Princess Mollie, A. Buckland & Son, Fresno, sow, \$70.

F. V. Covington, consignment, Laton—Laguna Lady Hadley, W. C. Ficklin, Fresno, sow, \$50; Laton's Orphan Jumbo, boar, \$35.

C. H. Myers, consignment, Laton—Big Chief Wonder, W. A. Snelson, Chowchilla, boar, \$25; Queen's Big Mike, Frank Dolechal, Chowchilla, boar, \$15.

J. W. Jones, consignment, Carruthers—P. E. C. H. Barkema, Fresno, sow, \$80.

L. A. Myers, consignment, Riverdale—Hadley's Choice, Jno. M. Bernstein, Hanford, sow, \$50.

G. W. Post, consignment, Laton—Princess Hadley, Frank Dolechal, Chowchilla, sow, \$85; Spring gilt, Perry Beauchamp, Kerman, sow, \$80.

Japanese whaling firms are endeavoring to create a market for whale meat as a substitute for beef. In 1918 there were 1,900 whale caught by five of the largest whaling companies in Japan.

CALCO feeders save costly grain

Grain at any price is too valuable to waste

The Calco Self-Feeder was developed—
to save your costly grain.

The Calco Self-Feeder is so constructed that it is impossible for the hogs to root the grain onto the ground—and grain saved is money saved.

Calco Self-Feeders add materially to your profits by saving expensive time and labor.

These Feeders are made of rust-resisting "Armco" Iron and Cast Iron. They are sanitary—easily cleaned—strong—durable and economical.

Your name and address written on the margin of this advertisement and mailed to us will bring folder and prices.

Better the Breeding the Better It Pays

(Written for Pacific Rural Press.)

Considerable interest has been manifested by several parties in the breeding of the grand champion carlot of fat hogs at the California International Live Stock Show. This carlot were Berkshires, and were exhibited by the Napa State Hospital, of which Owen Duffy is business manager. We wrote Mr. Duffy about this matter, and give his letter verbatim below.

"Answering yours relative to a carload of Berkshires, exhibited at the Livestock Show, will say that in 1914, we purchased from G. A. Perkins, Perkins, Cal., three purebred Berkshires: Kentucky Duke 3rd (193889), Mistress of Roselawn (152041), Lady Deal 37th (194141). In 1916, we purchased from Mr. Carruthers, Mayfield's Best (223402), Mayfield Master 7th (219888). In 1917, we purchased from Grape Wild Farms, Escalon: Duke's Victor Belle 7th (199683), Leader's Combination Belle (238290). We also purchased from the Univer-

sity Farm, Davis: Star of Napa (242368) sired by Star Leader (212544); dam, California Artful Belle (212476)."

"The Boar, Star of Napa, is the sire of the hogs that won the prize. We purchased him when he was quite a young pig, and he has developed into a very fine individual. All of the above mentioned parties from whom I purchased boars and sows, are entitled to more or less credit for the very fine herd of hogs which we now have.

"We have not kept up the registration of all our purebreds for the reason that we have not been in a position to keep the purebreds separate from the grades, and we have a herd that varies in numbers from 350 to 600 head. We hope, however, in the near future to establish at one of the ranches owned by the institution, a herd of purebred Berkshires. We have found them a very satisfactory breed."

NOTED BREEDER BUYS NEW FARM.

Just one mile north of the village of Live Oak in Sutter county lies 190 acres of the finest land to be found in that region. One-half of the 190 acres is in alfalfa, that greatest of stock feeds, and the rest grain land. Irrigated with water from the "eternal snows of the Sierras," it is intended by Nature to be one of the finest stock farms anywhere in the world. All it needs is the master hand of some breeder of live stock to make it the Mecca of all those interested, from the newspaper man to the east-

Beef Cattle Specialist

For 30 years I have been devoting my entire time to purebred beef cattle. I know the kind of cattle California needs and where and how to buy. I make regular trips to the great producing centers and will buy on order. Best of references. Satisfaction assured. Correspondence invited.
G. M. DUNLAP, Hotel Land, Sacramento, Cal.

ern or western buyer with a bank roll. This farm is completely fenced and cross-fenced into convenient-sized fields, equipped with plenty of buildings, all wired for electric lights and power. The station Riviera on the Northern Electric is on the place and the State Highway borders the farm.

What more would a man like Wm. Carruthers, who has just bought this farm, want than a place like the above with his Shorthorns and Berkshires there to grow into greater perfection than ever before. Leasing the farm west of Live Oak to rice farmers he finally decided to keep his stock, in that country as price of land and other conditions are more favorable for the stock-raising business than even at Mayfield.

Investment in seedbed preparation yields compound interest in greater yields.

Paint is cheaper than new lumber.

REGISTERED

50-SHORTHORNS-50

FROM HERD OF

W.C. SHORT

RENO,
NEVADA

—AT—

State Fair Grounds, Sacramento

THURSDAY, DECEMBER 11th, at 12:30 P. M.

For his initial offering, Mr. Short has selected a fine lot of deep red bulls, bred and open heifers ranging from 10 to 24 months of age, being the pick of a herd that is recognized as one of the oldest in the West, thoroughly acclimated to Western conditions, and improved by the use of high-class Scotch-topped bulls on chosen females that were maintained in the herd on account of their thick-meated and good milking qualities—the kind that raise their own calves, and raise good ones.

For grading up a herd on the farm or the range, better stock would be difficult to purchase. For the farmer desiring a few head of good quality Shorthorns at conservative values, a more attractive offering could not be found anywhere.

Every animal sold as a single lot is a guaranteed breeder and has been tuberculin tested.

THIS IS THE SHORTHORN OPPORTUNITY OF THE YEAR. DON'T MISS IT.

SACRAMENTO, CAL.

Poultry and Rabbits for Profit

A VICTORY FOR STANDARD BRED POULTRY.

(By Russell F. Palmer, Professor American Poultry School, Kansas City, Mo.)

Perhaps no egg-laying contest has ever created such widespread international interest as did the 1919 American Egg Laying Contest, conducted by Professor T. E. Quisenberry on the Leavenworth, Kansas, farm of the American Poultry School. Professor Quisenberry is the veteran egg-laying contest manager of America. The American Egg-laying Contest for the past two years was made up entirely of Standard Bred fowls. To qualify they had to attain a score of 90 points or better when scored at the start of each contest by an American Poultry Association licensed judge. As a 90-point score is the "mark of merit" necessary for a fowl to become eligible to consideration for a first prize in any poultry exhibition judged by the Standard of Perfection, it is thus apparent that the records made here are of added value in proving the egg-laying qualities of Standard Bred fowls especially selected to meet the Standard qualifications.

Pullets from all sections of the American continent from different foreign countries were housed, yarded, fed, and cared for alike in every respect. During the full twelve months the greater portion gave practical demonstration of the fact that a good hen will lay if taken care of properly. Over thirty per cent of all pullets in this contest made yearly records of 200 eggs or more. Two pullets laid over 300 eggs. One, a S. C. White Leghorn, produced 306; the other, a White Orpington pullet, produced 303 eggs, which, beyond question, is a world's record for heavy-weight fowls.

Seven pullets produced from 250 to 300 eggs; thirty-nine pullets produced from 220 to 250 eggs. Think it over! Over forty pullets that would have won the grand prize at most laying contests during three of the past five years were forced to go satisfied with simply making a wonderful record.

Perhaps, the most remarkable records ever made in any laying contest in this country were those made by Pen No. 10, containing 5 S. C. White Leghorns from Washington, with 1319 eggs, and was followed very closely by Pen No. 5, containing 5 S. C. White Leghorns from Pennsylvania, which produced 1301 eggs.

A PROSPEROUS POULTRY ASSOCIATION.

The report of the Tulare Co-operative Poultry Association shows that the volume of business transacted for October was \$18,000. Four thousand dollars' worth of poultry was handled, \$7,000 worth of eggs and poultry feed and supplies aggregating \$7,000. This was an increase of \$1,000 over the same month a year ago.

SANTA CRUZ EGG-LAYING CONTEST ON.

Forty hens were started last Saturday in the egg-laying contest at Santa Cruz. The contest will last a year. All fowls will be fed, housed and handled alike by experts. In view of the present price of eggs, the California Farm Bureau aims to stimulate interest in production and to obtain statistical information on the subject. The eggs will become the property of the farm bureau.

SUCCESS DEPENDS ON THE LOCALITY.

From Keokuk, Iowa, W. Burton writes to the Pacific Rural Press as follows: "Doubtless you have heard of the 'Weeks system' of management intended to increase egg-production at the minimum expenditure of effort and designed to be followed by those whose plot of ground is of limited extent. It seems to me that this method might be followed with some promise of success in the cooler (mountain or coast) sections of California, but would fail

if put into practice in the warmer localities, where mercury frequently reaches a point of 100 degree or more. Crowding the hens in small space in a section subject to high temperature would appear to invite disease and insect pests. Am I not right? And what do you know of the 'Weeks system,' anyway, as a general proposition?"

SOLUTION TO FACILITATE PICKING FOWL.

To the Editor: We have some fine geese and we would like to dress them for market. Could you please give me some quick and clean way to dress, or pick them so that the down and small feathers will come off easy. Is there any dip or something to rub in?—G. L. T., Chowchilla, Cal.

Some pickers, mostly amateurs, use the following solution: Take one tablespoonful of powdered rosin and dissolve the same in one gallon of hot water. There will be a residue, as some particles of the rosin will refuse to dissolve. When this solution is prepared, after plucking off the coarser surface feathers, plunge the goose to be picked quickly in and out of the solution. The finer feathers and down will thus adhere tenaciously to the fingers and the work of picking can be more easily done. This method of picking, while easier, lessens the market value of the fowl. Professional pickers resort to no dip or solution, but pick straight from beginning to end with the bare fingers. This gives the best product for the market.

RABBIT BREEDERS' PETITION.

The rabbit breeders of the San Francisco Bay counties are circulating a petition requesting the Agricultural College of the State of California to establish and maintain a rabbit experimental department to carry on certain research work and solve certain problems.

This work is summarized as follows: To determine the best breeds for market purposes; the breeds best for fur and meat; what feeds, or combinations of feeds are the best for breeding stock, nursing does, fattening ration for market stock, etc., what method of feeding produces best results, one two or three feeds daily, and how many ounces of feed for each rabbit of different ages and different breeds; what is the best hutch system for the average family rabbitry; and which is the best system for the different sections of the State; what is the nutritive value of meat as compared with other meats; what value is there in rabbit manure as compared with other manures, how is it best prepared for use locally, also how best prepared for shipment and sale, and where can a market be found for it, and will the price be commensurate with the labor, etc., involved; what would the cost of feed be for the different breeds at the different ages, and how much per pound for meat produced would it cost for feed for market rabbits with 6, 7, 8, 10, and 12 to the litter, the idea being to determine what is the proper number of young to leave with the doe to reap the greatest profit per pound of feed consumed; the cause, how best to prevent or guard against and the best method to adopt, best medicines to use to effect a cure of the diseases rabbits are subject to; the cause of crooked feet, lop ear, wry tail, etc., what uses can be made of the offal, and where can a market be found for such by-products, and will the price be commensurate; will it be profitable to alter young male market rabbits, and how best to accomplish it, at what age, etc.

RABBITS DO NOT BREED.

To the Editor: Kindly tell me what is wrong with so many rabbits for the past few months. Several of my neighbors as well as myself are having the same trouble. We get no

young. I have a good buck, have also tried a neighbor's buck, and the fault lies in the does. One of the younger ones has a litter now almost two months old.—Mrs. R. C. P., Manteca.

Sterility among rabbits is usually attributable to the buck being allowed to become overfat when young. The vitality goes to fat rather than to procreative virility. Sometimes the crossing of certain breeds will produce a sterile variety—"mule" offspring they are called. Perhaps your does are of that kind.

DOUBLING UP WITH BABY CHICKS.

(Written for Pacific Rural Press.)

The main disadvantage in buying baby chicks, if a person is raising poultry only a small scale, is in caring for the chicks until they are at an age to care for themselves. If a person is fixed for it, or is willing to bother with them, it is different. At the same time, the purchase of baby chicks is a big convenience when it is desired to increase the farm flock quickly.

Here is a little stunt that can be worked nicely. Put in an order for a certain number of baby chicks to be delivered at a definite date. Three weeks before that date set as many hens as will be able to care for those baby chicks in addition to what they are able to hatch out, for a hen can usually look after twice as many chicks as she is able to hatch, or nearly that number. Of course, for the system to work well, it is necessary to have a proper supply of sitters at the right time, which does not always happen.

Introduce the artificially hatched babies to a hen just off the nest and the adoption will occur immediately, which it will not do if there is too much delay. Since a mother hen in proper surroundings can bring up chickens very successfully, this system is not only a labor-saver, but fine chickens are raised by it.

Warning: Do not try to overdo the thing, as the person did who tried it in this neighborhood. He bought twice as many chicks as the hens hatching could care for. The chickens were too crowded, piled on top of one another to keep warm, and he lost about half of those he bought. Moderation in this as in all things.

Poultry Notes.

I. N. Foss, manager of the Co-operative Poultry Association at Tulare, says that Los Angeles buyers recently invaded Tulare territory for turkeys, and offered prices for all the gobblers they could buy. The price for choice turkeys was 34 cents and southern buyers were said to be willing to take all they could get at the top prices. Foss states that the market is likely to advance and that in his opinion there will be no decided falling off in the Christmas demand.

According to the weekly report of the Poultry Division of the Canadian Department of Agriculture for October 14, 1919, Canadian shippers are exporting large quantities of eggs purchased in the United States, some going through Canadian ports and some through ports of this country. At the London market on October 20 English eggs brought 87 cents per dozen; Irish, 75 to 82 cents; Danish, 78 to 82 cents; Canadian, 2 to 70 cents; and American, 57 to 62 cents.

During the past month the McCullough Provision Co. at Tulare shipped 18,000 young tom turkeys to the Philippine Islands on a contract with the war department to supply the American troops in the Orient with their Thanksgiving birds. The contract has been divided between the company branches at San Jose, Petaluma and Tulare, but when the other cities could not secure the birds, Tulare provided the entire shipment.

GIANT BRONZE TURKEYS—The Gold Nugget Strain continually prove their superiority by winning Gold Special Sweepstakes for best turkeys at the following great shows: Livestock Show, Los Angeles, Cal., October, 1919; Liberty Fair, Los Angeles, Cal., 1918; Southern California Fair, Riverside, Cal., 1918; Pacific Coast Exposition, Oakland, 1918; Texas State Fair, 1917; Los Angeles Show, 1917-18; California State Fair, 1917-18; Arizona State Fair, 1918. Each judge pronounced them the best in show, all breeds competing. An unequalled record. This year's awards all first prizes at the Washington State Fair, September, 1918, and the Oregon State Fair, 1919. Large turkeys can be raised at practically the same cost as small ones. Let me help you make more money. My stock will assure you of more meat when market time comes. Stock and eggs for sale. Circular J. Will Blackman, Originator Gold Nugget Strain, 607 E. Third St., Los Angeles, Cal.

JANUARY, FEBRUARY chicks are money-makers, if you are equipped to handle them right and can put good stock into your brooders. That's our part—supplying them. Well bred and hatched right. Why not buy where quality, service and economy are to your advantage? Our breeds—White, Brown and Buff Leghorns, B. I. Reds, Barred and White Rocks, Black Minorcas. Write us your needs. Circular free. Mission Hatchery, Box 17, Campbell, Cal.

MAHAJO FARM, P. O. Box 597, Sacramento, Calif., offers highest class, standard bred, breeding stock in White Leghorns, Light Brown Leghorns, Dark Brown Leghorns, White Plymouth Rocks. Prices: Leghorns—males, \$5.00; females, \$3.00. Rocks—males, \$7.50; females, \$3.00 and upwards.

BABY CHICKS—From my Single-comb White Leghorns, bred for heavy layers, which have been in the race for 12 years, and today is among the leaders. You don't go wrong by placing your order with me. Write for prices and terms. H. A. Schlotthauer, Exeter, California.

THOROUGHBRED S. C. White Leghorn chicks in 100 and 1000 lots from Hoganized and trapped stock. Order early for spring delivery. Inventors and Distributors of "Forbros" Separator and trapnet combined. Forster Brothers, 2918 Otis St., Berkeley, Cal.

LIGHT BRAHMAS—Large stock direct from the East. Cockerels, \$5.00 to \$10.00 each; pullets, \$5.00 to \$8.00, non-related. Golden Sebright and Black Cochins Bantams. Rouen Ducks. All prize stock. Emma V. Miller, R. D. 2, Box 534, Santa Cruz, Cal.

BABY CHICKS—Order now for 1920 and get what you want when you want them. White and Brown Leghorns, B. I. Reds, Barred Rocks. Safe arrival guaranteed. Write for free circular. Stubbs Poultry Ranch and Hatchery, Box 87, Palo Alto.

ANDERSON'S PEEPERLESS ANCONAS lay more and eat less than other breeds. 50 big husky cockerels \$5 and up; 200 pullets, trios and pens for sale. Hatching eggs. Catalogue free. J. W. Atkinson, Box B, 130 Willard Street, San Jose, Cal.

"WATCH US GROW"—Baby chicks. Bookings orders now for January and February delivery. White and Brown Leghorns, B. I. Reds and Barred Rocks. Safe delivery guaranteed. Order early. E. W. Ohlen, Campbell, Cal.

S. C. RHODE ISLAND RED cockerels, February hatch, breeding pens. Hatching eggs. Improve your color and egg capacity. Also Rose-comb Reds. Wm. Larm, 3915 39th Ave., Fruitvale, Cal.

BREEDING COCKERELS—Barred and White Rocks, Orpingtons, Anconas, Black Minorcas, B. I. Reds, Buff, White and Brown Leghorns. Day-old chicks in season. Enoch Crews Seabright, Cal.

BABY CHIX—Hatched from our own stock in our hatchery. Hens are of S. C. White Leghorn Utility stock, bred for commercial laying. H. A. George, Petaluma, Cal., R. D. 2, No. 29.

HART'S BRONZE TURKEYS—Large, vigorous young stock of both sexes for sale; also year-old hens. Eggs in season by the setting or hundred. Albert M. Hart, Clements, Cal.

MAMMOTH BRONZE TURKEYS—Order now for immediate or future delivery. Choice young stock from prize winners. Prices reasonable. A. W. Ganger, Rt. 1, Doe Palco, Cal.

FOR SALE—Thoroughbred Buff Orpington cockerels, February hatch, from good laying strain. \$5.00 and \$7.50. Also Buff drake, \$5.00. Mrs. M. J. Lopez, Manteca, Cal.

BARRED PLYMOUTH ROCKS—Nothing better in poultry. Prize-winners and wonderful layers. Choice stock for sale. Chas. H. Voden, Box 3, Los Gatos, Cal.

"ASTMAN'S BRED-TO-LAY" Hoganized and trapped Barred Plymouth Rocks. Eggs; cockerels. January chicks. Fairmead Poultry Farm, Fairmead, Cal.

BRONZE TURKEYS AND EGGS—Limited number of breeders. Eggs by settings, hundred or thousands. M. M. Reiman, Planada, Cal.

"GOLDCROFT" BUFF ORPINGTONS—Fine, well-developed cockerels; also cocks and hens. Prices reasonable. Samuel Abrams, Los Altos.

CHICKENS, DUCKS, GESE, GUINEAS, Pea Fowl, Pigeons. Wm. A. French, 645 W. Park St., Stockton, California. Stamps.

BUFF ORPINGTONS, BUFF DUCKS, ROUBON RED TURKEYS—The Ferris Ranch, Rt. 2, Box 144D, Pomona, California.

MAMMOTH BRONZE TURKEYS, Embden Geese and Collie Dogs for herding purposes. John G. Mee, St. Helena, Cal.

WHITE LEGHORN BABY CHICKS—Ferris and Tanager strains. Circular free. Henry Tarratt, Corning, Cal.

BUFF LEGHORN COCKERELS from a good laying strain. C. W. Leding, R. 3, Waterville, Cal.

BOURBON RED TURKEYS—M. Geo. F. Smith, Hardwick, Cal.

When All the Water Is Used, Then What?

(Written for Pacific Rural Press by D. J. Whitney.)

"Where is all the water going to come from that is needed for irrigation?" People in irrigation districts with a fine water right may not worry much about this subject, but it is something for nearly everybody else to think about. Even in the big majority of irrigation districts ditch water frequently gets very scarce as summer advances, and ranchers there find the subject a good one to consider too. Their solution is usually simple. It is to put in pumping plants to help out in dry periods. Such plants will not use anything like as much as pumps where there is no ditch water, and seepage from canals and over irrigation will replace the underground water that the pumps remove. Pumping in those locations will always be easy and ranchers there are in luck.

In newly settled districts without ditch water the case is altered. The first irrigators may find water in easy pumping distance, but when more and more pumping is done supplies may almost give out. It is utterly impossible to take more water from the ground than goes into it from rainfall and from mountain streams. Inasmuch as the rainfall normally will only wet down a few feet in those parts that need irrigation, streams are the only supply of ground water, and whenever more water is pumped out than the streams pour in, something is due to bust somewhere.

How Things Go.

As it becomes difficult to get water from shallow wells and small lift pumps, everybody can lower wells and pumps and get more water—for the time being, but when all the water that is supplied by streams is taken out with an average lift in a district of say 50 feet, it is going to do no permanent good to lower pumps until the lift is 60 or 70 or 100 feet or 300 feet, even were such a thing commercially possible. The natural consequence when this system is tried is for persons with small capital, or in naturally poor locations, to give up their ranches, or to run on very short supplies, and then, of course, there will be more water for others. The natural tendency will be to eliminate irrigation on poor ranches or where water is too hard to get.

In many places poorly situated the water will exhaust supplies that are coming in from streams and will begin to draw upon water that has been standing deep underground for years, maybe for centuries, or at least water that is moving so slowly to the ocean that it has had time to be impregnated with alkali. Their wells then will be unfit for irrigation. Such cases frequently occur.

For example, last spring a well borer of this county put down a well over 200 feet without getting as much water as the land owner wanted, and was told to keep going. He kept going and got excellent water gravel at about 400 feet, but the water proved to be poisoned with alkali. The only thing possible in such a place is to fill up the well with clay until the alkali water is blocked off and to irrigate with limited supplies above. When, after a series of dry years or increased pumping on other ranches, the good water in such a well gives out, the rancher will be out of luck. He can use the little he has and pray for rain.

What Shall We Do About It?

What has been said is simply that there is a limit to the amount of water that can be pumped, and when that limit is reached, heavier pumping means greater expense and, for the district at large, no more water. The Sacramento Valley has far more than enough stream flow to irrigate every acre of good land in it. On most of the rest of the state where irrigation is needed the problem of water should be watched, and the rapid development of new land will make watching very necessary.

The first and most sensible proposition is to see that as little water runs to waste into the ocean as is neces-

sary. Every gallon that is put into irrigation ditches will either be spread on fields and be absorbed by plants or evaporated into the air, or it will sink into the ground and keep up the underground water supply for pumping plants.

Underground Storage of Water.

Seepage water in districts where much pumping is done is not lost, it simply is pumped a second time. A proper diversion and storage of mountain water would not only straighten out the irrigation problem, but it would overcome the great expense and loss from floods on the lower Sacramento and San Joaquin rivers.

Not far from this ranch of the writer there is a small, private irrigation ditch, providing only a partial supply for the large ranch where most of it is used. That ditch is kept full of water all the year. When the water is not used on the ranch it is turned into a dry stream bed, and a heavy flow completely disappears in less than half a mile, unless heavy rains come on. Since the owner of the ditch has several large pumps, the water that sinks through the sand gives a supply to those pumps during the summer; thus the ditch water brings the water level nearer the surface, helps the rancher's wells and makes the power used less than it otherwise would be. Also it helps the neighbors who pump. That it actually does this is seen by the fact that whenever heavy rains fill that dry creek the water rises so quickly in the well on the writer's ranch and in all nearby wells, that pumps have to be lifted quickly or they will be flooded. A year when there is some winter flow in that dry creek is a good one for irrigation; when the rains do not bring the water very far down it, the water level is low.

More Economical Use of Water.

This little illustration of how ditch water emptied into the ground makes pumping easier, illustrates what is needed in the state as a whole. The more stream water used in irrigation, the better for ranchers with pumping plants. On the other side of the proposition, the more pumps that are used near and in irrigation districts, the less danger of water rising close to the surface and spoiling land. An abundance of pumping plants near irrigation districts will nearly solve the drainage problem. What has thus far been said relates to general matters. For the individual several things can be done.

Make the available water do as much good as possible. It has been shown, for example, that the more water used on alfalfa, the more alfalfa grown, but a plentiful supply will give far more alfalfa when used on two acres than on one acre. In other words, rather than scant supplies may enable a man to get fair enough crops, even if he could use more to advantage. This depends partly upon what he grows. The more water a man has, the more he will use, whether he needs particularly or not. He will also be careless about irrigation if he has a surplus. Consequently scant water will result in greater care in irrigation, less waste by leaks and indifference, better tillage and better ranch management.

Protection Against Seepage.

Open ditches are an extravagance and a nuisance. In this district the almost universal system is underground cement pipe, which is expensive, but a big saver of water and a great saver of labor in irrigation. In many soils it takes twice as long to irrigate a piece of land if an open ditch is used as if a pipe line is installed. This seepage loss helps the other pumping plants but it is wasteful for the individual irrigating, and the seepage water robs him of plant food. It is better for everybody if no more water is pumped than is needed.

Selection of Crops.

This is an extremely interesting subject and one very much overlooked. Alfalfa, for example, takes

an immense amount of water. Also, gophers revel in it and in irrigation small streams pour wastefully away, and there is little that can be done against it. Two acres, people here estimate, of fruit can be grown with the water used on one acre of alfalfa. Since fruit pays better than alfalfa, alfalfa in good fruit districts is doomed for the down grade.

The same principle can be used on other crops. It is natural for a man to figure how to make his water do the most good, so he may select milo maize instead of Indian corn, when either will grow well provided water is sufficient, and so with other things.

As to fruit crops this principle has two angles. There may be lots of water as a rule, and not very much if a series of dry years comes. In the case of two fruits needing equal amounts of water, the planter should select the crop that can live through a dry spell and reject the one that could not. For example, an orange grove that would have to go away with only two irrigations would be in a bad way. An olive orchard in the same place that needed plenty of water to set good crops could survive a year with no irrigation at all and not suffer much. Consequently, when there is doubt about the regularity of a water supply, something that could endure an occasional drouth should be selected.

Figs in this respect are comparable with olives, but another principle can be put to them. They can stand drouth and they can also fruit well with very little irrigation. The writer has planted a fig orchard, not on account of small moisture demands, but on other merits and has investigated the fig business closely. It seems certain that figs will produce good crops on very little water; and in areas where the land supply is far in excess of the water supply, twice the area of fig orchard could be successfully handled on a definite amount of water. This would depend upon the winter rainfall. The same principle can be used with certain other fruits.

Conserve the water supply, see that all natural flow is saved; prevent waste, and in case the supply is still likely to be deficient, select the crops that will do best on least water.

Purebred poultry means uniformity of products. Uniformity of products means increased profits, if they are properly marketed. Given the same care and feed, purebred fowls will make a better profit than mongrels.

CALIFORNIA POULTRY PRACTICE

A Practical Treatise on
POULTRY RAISING
In California

By Mrs. Susan Swaysgood
Writer and Breeder of
Utility Poultry

160 pages of text, besides many
full-page illustrations.
Cloth bound.

In writing this book, the author, after a lifetime of active, practical and successful experience in poultry raising on the Pacific Coast, has endeavored to show the farmer how he can make the poultry department of his business more profitable. It deals with actual conditions—not theories—and covers every phase of the industry from eggs, chicks, diseases and remedies to the profitable marketing of the products of the poultry farm.

Price, \$1 per Copy, Postpaid

This book will help you in the many
details of poultry raising.

THE HOME CIRCLE

"THE CROWN OF A PERFECT LIFE."

When we come to the crown of a perfect life

And we rest in joy with our soul,
And with loved ones meet in a sweet retreat,

And commune on the Christ, our goal,

O the thought of the Love that our Life contains,

What bliss can there greater be!
Tho' earth's sun goes down, yet the true Light reigns,

We are friends through eternity.

We live in the Light of a Perfect Day
For the end of all sorrows is come,
And our hearts are fraught with the splendid thought

Of a work that is nobly done,
For Truth has unfolded this Perfect Day

Whose radiance shall never pass
For we've come, step by step, o'er the Living Way

To our Home here in Heaven at last.

—A. R. M.

THE REAL MARY.

Quite early one morning Thelma's mother said to her, "If you'll be just as good as gold all day, I will take you to see little Mary this afternoon."

"I'm afraid I can't be all good, Mamma," said Thelma, "but I'll be some good."

Thelma was not quite four years old, and had not played with many little girls, and when Mamma said she should be taken to see "Mary," she instantly thought of the Mary in her picture-book, who was dressed in a beautiful pink dress, and wore a great white hat with floating ribbons.

The picture-book Mary wandered over green fields, and after her strayed a snow-white lamb led by a blue ribbon. This was the Mary that Thelma expected to see; and she was so good that, when nap-time came, Mamma told her that she had been "as good as gold," and should surely be taken to see Mary.

"And the lamb?" asked Thelma, drowsily; but Mamma did not hear.

Thelma waked from her nap with her blue eyes as bright as stars and her cheeks like roses; and, when she was dressed in the whitest of white dresses and the bluest of blue sashes, she danced about, singing: "I'm going to see Ma-wy; I'm going to see Ma-wy!"

Thelma and Mamma walked and walked along the pleasant country road, and at last they came to a large white house.

"This is Mary's house," said Mamma; and Thelma squeezed her mother's hand, and shivered all over for joy.

They were taken into a room that seemed to be full of sunshine and green growing things. There was an aquarium near a bright window, and beside it stood a little girl, feeding the fish. Long yellow curls fell about her rosy face, and she wore a red dress and a white ruffled apron.

"That is Ma-wy's sister," thought little Thelma to herself; but just then her mother led her forward, and said, "This is Mary."

A sob rose in Thelma's throat; but the strange little girl smiled so sweetly that she said to herself, "P'raps she doesn't wear her pink dress 'cept when she's having her picture taken."

So she ran forward and took Mary's hand, and looked up into her face, and said, "Won't you show me your lamb?"

"I haven't any lamb," said Mary, wonderingly; and then poor Thelma could bear no more. She lay down with her face against the floor, and cried and cried.

Her mother and Mary's mother and Mary, all gathered around her to find out what could be the matter; but it was a long time before she was able to tell them.

At last she told them, sobbing:—

"It isn't the weal Mawwy. Mawwy's dress is pink, and the lamb goes evwywhere that Mawwy goes."

Then they all knew.

But after a while little Thelma grew quite happy, looking at the gold and silver fish as they darted through the clear water and nibbled Mary's fingers or ate the food she gave them; and, when the time came to go, she kissed Mary, and said: "Good-by, Carline! I'm going to call you Carline, after my dolly."

After Thelma and her mother had walked quite out of sight, Mary said to her mother, "I don't like to be called Carline, and I wish I could have a lamb!"

Her mother laughed, and said, "So you could be the weal Mary?"

Time and time again, in the early morning, Mary had heard the sheep passing the house on their way to the town. She had listened to their bleating and the patter of their soft feet without thinking much about them; but now, remembering little Thelma, the next time that she was awakened by the shouts of the drivers and the hundreds of pattering steps, she jumped right out of bed, and ran to peep through the blinds.

The sun had not risen yet, and everything was gray,—the sky, the road, the sheep, and the clouds of dust, which almost hid the shouting men who drove the great flock.

As Mary stood there looking out, she saw a lamb that limped painfully along, sometimes hopping just a little way on only three feet. "Oh, the poor thing!" she cried softly; and, just as though it heard her, the lame lamb turned from the flock unseen, and dropped in a little heap behind some bushes.

Mary waited until the sheep and men were but a cloud of dust in the distance. Then down she ran in her nightgown, and sped quickly across the green lawn out where the lamb was lying.

It looked at her with piteous eyes, and tried to rise; and she petted and coaxed it. And presently it was strong enough to hobble by her side up to the porch, where she made it a bed of rugs and cushions. And, finally, she fell asleep by the side of the lamb, with her hand on its soft warm back.

When Mary's mother looked into her little girl's room that morning, she found shoes and stockings and a little gown and petticoat, but no Mary. So she hastened down the stairs; and there she saw the open door, and went out. There on the porch among some rugs, warm in the sunlight, lay—what? Two heads were raised at once, and Mamma looked into her little girl's eyes and a lamb's eyes.

"O Mamma! Mamma! mayn't I keep it?" cried Mary; and the lamb softly bleated, "Ma-ma! Ma-ma!"

Mamma was astonished, and then she laughed, and said the lamb certainly might stay a little while.

It was a very busy day at Mary's house, for the new-comer had to be washed and be fed, and be combed and be brushed, and be adorned with gay ribbons; and the lame foot was to be made well and strong. The day was full of joy, besides; for Mary's father found the drivers who had passed that morning, and they said Mary was welcome to keep the little lame lamb.

One breezy day the postman brought Thelma this little letter:—

"Dear Thelma:—Will you come to play with me this afternoon?"

THE REAL MARY.

So, when Thelma had had her after-dinner nap, and her eyes had grown as bright as stars and her cheeks like roses, and she was dressed in the whitest of white dresses and the bluest of blue sashes, she and her mother set out to walk along the pleasant country road again. By and by they came to the large white house where they had been before.

"That's Carline's house," said Thelma.

"Mary is in the meadow," said Mary's mother, smiling at Thelma as

SANTA SAYS—

ROLLER SKATES!

FOR THE CHILDREN only \$2.30

What will tickle the kiddies more than a pair of **ROLLER SKATES!** Every youngster wants to own a pair of skates—it's such great fun, and healthy exercise for the boy or girl. Get them a pair for Christmas—these are ball-bearing, good steel wheels, can be extended any size from 7½ inches to 10 inches in length, have steel toe hold, leather strap in back, a genuine quality pair of skates made by Union Hardware Co. Order now so you will get them in time. Every sale made with money-back guarantee.

—And Here is Another BARGAIN!

Get this ELECTRIC IRON!

ONLY \$3.69

—Order NOW for Christmas

A practical gift at a bargain price! This Electric Iron of highest quality, best workmanship—with ordinary care, it will last a lifetime—forever ends the killing drudgery of the old-fashioned iron. Point scientifically shaped—will not catch or tear work—has built-on stand—when not in use simply stand on end; nickeled, ebony-finished handle, with 6-foot cord; written guarantee for one year. Send for this iron TODAY, only \$3.69—remember, if not perfectly satisfied—send it back—money will be refunded without question or cost to you.

\$22.50—for large size cook-stoves

VAUGHAN & MATTHEWSON,

Pacific Coast Representatives

225 Market Street, San Francisco, Calif.

When you taste Schilling Tea, don't look for the puckery bitter taste of common tea. That isn't tea-strength; it is tannin-strength, and tannin isn't good for the stomach.

No; look for an abundance of fine rich delicious-flavor—the taste that really belongs to tea.

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchment-lined moisture-proof packages. At grocers everywhere.

A Schilling & Co San Francisco

Lights with a Match!

NO torch needed with this new lamp. Just use a match as with the old time oil lamp. Gives a brilliant, steady, white light of 800 candle power, brighter than the brightest electric light, safer than the safest oil lamp, cheaper than the cheapest candles.

Coleman Quick-Lite

makes and burns its own gas from common gasoline. No wicks to trim—no globes to wash. No dirt, grease, smoke or soot. Absolutely safe, no danger of fire or explosion. Fuel can't spill—no danger if tipped over.

Blake, Moffitt & Towne

37-45 First St., San Francisco

Blake, Moffitt & Towne, Los Angeles

Blake, McFall Co., Portland, Ore.

He opened the door. "Just walk down yonder little path until you come to the stream. Jump across the water and look over the wall, and you will see her."

Thelma walked down the little path, jumped across the tiny silver brook, and peeped over the wall. And what did she see?

There came the real Mary running across the green meadows to meet her,—the very Mary of the picture-book, with strapped shoes, and a pink dress, and a large white hat with ribbons floating in the wind. She had a blue ribbon in her hand, and the blue ribbon was tied around the neck of a now-white lamb that skipped and jumped along after her.

"You darling little Thelma!" said Mary; and she helped Thelma over the wall, and let her pet the lamb, and read him by the blue ribbon, and feed him with sweet red clover-tops.

What a happy time they had! They jumped and ran and played just as lambs and little girls like to; and when they grew hungry, Mary brought out a basket that had been hidden among the bushes, and spread their tea on a white cloth on the grass. They had tiny sandwiches,—"just crowds of them," Thelma said,—and delicious little cakes, and bottles of

milk to pour into the doll-cups from which they drank; and the lamb lay beside them as they ate, and would have a taste of everything.

When it was time to go, Thelma kissed Mary and the lamb twenty times apiece, and said, "I shan't call you Car'line, never no more; for you are the real Ma-wy."

CHARTREUSE OF BEEF AND MACARONI.

Simmer $\frac{1}{2}$ pound ground round steak slowly with 1 tablespoon finely chopped onions, 1 tablespoon finely chopped green peppers, salt and pepper to taste and 2 cups of stock, for 20 minutes. Cook a package of macaroni in 2 quarts of boiling water to which 2 teaspoons salt have been added. Boil until tender and drain. Grease the baking mold and lid and line mold with macaroni to an inch thickness; then mix $\frac{1}{4}$ cup bread crumbs and meat and put in center of mold within an inch from the top. Use remainder of macaroni to fill mold, cover and steam 40 minutes; slice and serve with spiced tomato sauce.

CATSUP FROM CANNED TOMATOES.

This recipe enables one to make up a small quantity of catsup at any time. Place in a granite saucepan one quart can of tomatoes and add three-quarters of a teaspoonful of salt, half an onion grated, two tablespoonsful of brown sugar, one-quarter of a teaspoonful of ground cloves, half a teaspoon of paprika, half a teaspoonful of cinnamon, three sprigs of parsley, half a cupful of vinegar and two stalks of chopped celery. Let all simmer until quite thick, press through a coarse sieve, reheat and seal as for ordinary catsup. A slice from a clove or garlic may be added, if desired.

CROUTONS.

Many people prefer croutons rather than crackers with soup. They are very appetizing and easily prepared. Take bread that is old enough to toast nicely, cut into medium slices, butter lightly, cut into strips or squares and place in a quick oven to toast. Some prefer them of stale bread cut into cubes or squares, then dropped into hot fat and browned. Lift them from the fat with a skimmer, drain, add to soup and serve.

CHEESE BALLS FOR SALAD.

Add one tablespoon melted butter to one cup of cream cheese, two tablespoons of cream, a pinch of pepper; cream together and add one cup of chopped nuts or part nuts and olives. Roll into balls with the butter paddles and serve on or with the salad. Half an English walnut meat on each side is attractive or the balls may be rolled in finely chopped parsley leaves.

Housekeepers wishing to economize these days should serve navy beans, as they are now as cheap as they were in 1915.

Milk toast is only skimmilk and stale bread, both of them left-overs, but it makes a good dish for breakfast, luncheon, or supper, for children.

Market Comment

A Poulterer's Dream.

A Petaluma prophet predicts that eggs will be selling for \$2 a dozen before the winter is over. S. S. Knight, the prophet in question, is president of the Poultry Keepers' Association, and perhaps his position has something to do with his optimism. However, notwithstanding the prevailing high market price of eggs, the average here in the Association profits its owner only 75c this year, as against \$1.35 last—presumably due to the high cost of feed, labor, and incidentals. The report of the U. S. Bureau of Markets that there are more eggs in storage now than this time last year, would seem to militate against the realization of the sensational rise prophesied—desirable as that may be from the egg-raiser's point of view.

Oakland a Wool Center.

The largest woolen mill west of New England will be in operation in Oakland by next May, according to information reaching the Oakland Chamber of Commerce today. The Federal Wool Manufacturing Company, which has just been incorporated, will begin at once erecting a mammoth plant at East Fourteenth street and Fifty-sixth avenue, adjacent to new packing plant of Libby, McNeil & Libby. The plans for the plant call for an outlay of \$1,800,000. The site comprises 23 acres. One thousand workers will be employed, of whom seventy-five per cent will be women.

A Declaration of Faith.

"We believe that our prices are justified by the facts and we know that raisins are today the cheapest fruit in the world. We believe that we can satisfy the federal trade commission that we are right." Thus declared Wylie M. Giffen, president of the California Associated Raisin Co. on leaving for Washington to attend the government investigation of alleged high price-fixing. We don't recall that any one instituted a price-fixing investigation when raisins were grown and sold at a loss to the grower.

Has Nothing on San Francisco.

An item in the "Weekly Crop Notes," a Government circular, says: "In a central Ohio city, the first live Thanksgiving turkey sold this week for \$9.00—live weight, 20 pounds, price 45 cents a pound." This writer was today asked 65 cents a pound for a turkey in a retail store in this city. It looked to be worth every cent of it—but it is still in the store.

Whisky Down—Raisins Up.

An authority in the raisin world, E. L. Chaddock, president of Chaddock & Co., independent raisin packers, testified the other day before the Federal Trade Commission that one cause of the high price of raisins and their scarcity in the Eastern market was the enforcement of prohibition.

Wide Range in Fruit Prices.

On account of the irregularity in the quality of the offerings during the past week, there has been a very wide range in prices in all fruit markets. There were occasional high sales on sound stock, but the average of the market was below the offerings of the week previous.

Its Effect on Sugar Beets.

The Government has announced its intention of fixing a flat general price of 12 cents a pound for sugar. The establishment of a flat rate would operate as an automatic minimum to raise the price of all beet sugar produced in this country.

Hay Season Good.

Most of the hay crop in the Livermore section has been shipped or is in dealers' hands. The past season was an unusually good one for producers.

Beans Showing Life.

At Modesto the late bean crop is moving fairly well. Small whites are commanding 6 and pinks 7 cents per pound.

Alfalfa Seed 35c.

Alfalfa seed is not only high but scarce this early in the season. Dealers are betting around 35c for good seed.

THE MARKET REPORTS

SAN FRANCISCO

San Francisco, November 26, 1919.

BARLEY.

The same conditions prevailed in the barley market this week as last and the grain was firm on the demand for feedstuffs.

Feed \$3.40 @ 3.50

Shipping \$3.45 @ 3.55

OATS.

Oats have not responded to the strength of barley and the feed description is unchanged. An increased demand for seed oats gave strength to that variety and sales were made at higher prices.

Red seed, per cwt. \$3.85 @ 3.90

Black for seed Nominal

Black for seed \$3.25 @ 3.50

Re-cleaned Red or Black for seed Nominal

CORN.

There were no changes in the market for corn this week. The local demand continues at low ebb and the difficulty of shipping either by land or sea is holding back this grain.

California \$3.60 @ 3.70

Egyptian, choice \$3.30 @ 3.40

HAY.

Receipts of hay for the past week were 874 tons compared with 1616 the previous week. These receipts were divided about equally between rail and water arrivals, but all the rail receipts were for Government account. In other words the car situation has not cleared up in the least and little hope is held out by railroad officials of an improvement. Naturally this causes an unsatisfactory condition in the hay trade, for although sales can be effected deliveries cannot be made. Owing to these transportation difficulties, as well as the continued dry weather, the market is stronger with an upward tendency. Demand from country districts has been especially good and considerable hay as well as alfalfa is moving to interior points from sections fortunate enough to secure an occasional car.

Special Livestock Market Report

San Francisco, November 26, 1919.

CATTLE—There is little change to report in the live cattle market during the past week. Prices are stiffening somewhat, though quotations are unchanged. The slight decrease in arrivals is offset by the falling off in consumption due to disturbed labor conditions. There is an insistent demand for prime steers. Calves are easy.

Steers, No. 1, 1000-1200 lbs. 10½ @ 11c

do, No. 1, 1200-1400 lbs. 10 @ 10½c

do, 2nd quality 8½ @ 9c

do, thin 8½ @ 7½c

Cows and Heifers, No. 1 7 @ 9c

do, 2nd quality 7 @ 7½c

do, thin 4½ @ 6c

Bulls and Stags, good 5½ @ 6½c

do, Fair 4½ @ 5½c

do, Thin 3½ @ 4½c

Calves, lightweight 11c

do, medium 10c

do, heavy 8 @ 9c

SHEEP—Mutton sheep and lambs have been in good supply, and the retail demand for good cuts is satisfactory. Prices hold, and the trend is toward a strengthening of the market a little later.

Lambs, yearling 10c

do, milk 12 @ 12½c

Sheep, wethers 9 @ 9½c

do, ewes 6½ @ 7c

HOGS—Killers have no trouble in filling their requirements, but absorb all that are offered—especially of the hard and well-finished kind. The price market is firm, but unchanged as to quotations.

Hogs, hard, grain-fed, 100 to 150 lbs. 15½c

do, 150 to 225 lbs. 16c

do, 225 to 300 lbs. 15½c

do, 300 to 400 14½c

Los Angeles, November 25, 1919.

CATTLE—Steers steady and demand very good for them. Cows continue slow sale and weak. Prices unchanged.

Per cwt. f. o. b. Los Angeles:

Beef steers, 1000 @ 1100 lbs. \$9.50 @ 11.00

Prime cows and heifers \$8.00 @ 9.00

Good cows and heifers \$7.50 @ 8.00

Canners \$5.00 @ 5.50

HOGS—Hogs in light supply, but fair demand with prices steady.

Per cwt. f. o. b. Los Angeles:

Heavy averages 275 @ 350 lbs. \$11.00 @ 12.50

Light \$14.00 @ 16.00

Heavy averages 225 @ 275 lbs. \$13.00 @ 14.00

1919 DECIDUOUS FRUIT SEASON A RECORD.

The 1919 deciduous fruit season has closed, after having established new high records for deciduous fruit shipped from California. This applies to amount of fruit shipped as well as prices. Figures compiled by the California Fruit Distributors show that 29,636 carloads of deciduous fruit have been shipped from Superior-California points to the East this year, as compared with 25,124 carloads shipped during 1918. The 1918 shipments set a new record for amount of fruit shipped. The shipments of 1919, as compared with those of last year follow:

Cherries	335	351
Apricots	419½	433½
Peaches	2,773½	2,662
Plums	2,918½	2,389½
Pears	4,246	4,447
Grapes	18,894½	14,750½
Miscellaneous	49	60½
Total	29,636	25,124

The markets in the East are holding up very well as regards prices. There was a slight reduction in the price paid for Emperor grapes.

No. 1 Wheat, or Wheat & Oat \$20.00 @ 24.00
No. 2 Wheat, or Wheat & Oat \$19.00 @ 21.00
Choice Tame Oat Hay \$22.00 @ 25.00
Wild Oat Hay \$18.00 @ 25.00
Barley Hay \$18.00 @ 22.00
No. 1 Alfalfa Hay \$20.00 @ 25.00
Stock Hay \$15.00 @ 18.00
No. 1 Barley Straw, per bale50 @ .80

FEEDSTUFFS.

Roller oats and rolled barley were strong at advanced prices as the demand for all the feedstuffs continued owing to the lack of rain. Locally, there is very little demand.

Roller Oats \$24.00 @ 25.00

Roller Barley \$20.00 @ 25.00

Cracked Corn \$20.00 @ 25.00

Alfalfa Products \$38.00 @ 45.00

POTATOES, ONIONS, ETC.

Prices for potatoes held firm this week, notwithstanding the fact that they are not moving well. This, however, is wholly due to the holiday season and has nothing to do with actual conditions except momentarily. As a consequence the lack of demand this week has not affected the firmness of the market. Onions also are quiet so far as movement is concerned, but firm regarding price. The general vegetable market has been brisk this week on the holiday demand. Celery is in excellent demand and sells from \$5 to \$6 per crate. Lettuce was somewhat scarce this week and advanced about a dollar per crate. There are few, if any, cucumbers except the hothouse variety now on the market and the latter advanced in price on a good demand.

String Beans, lb. 12 @ 17½c

Peas, lb. 15 @ 30c

Carrots, per sack 75c @ \$1.00

Celery, crate \$5.00 @ 6.00

Cucumbers, box Nominal

do, Hothouse \$2.00 @ 3.00

Lettuce, per crate \$1.75 @ 2.25

Tomatoes, Stone 60c @ 1.25

Hubbard Squash, sack \$1.25 @ 1.50

Pumpkins, sack 75c @ 1.00

Rough docked 20 lbs. piggy sows 40 lbs. and stags, 40 per cent.

SHEEP—Lambs in good demand. On ewes and wethers the sale is slow. No change in prices.

Prime wethers \$8.50 @ 9.50

Yearlings \$8.50 @ 9.50

Prime ewes \$8.00 @ 8.50

Lambs \$12.50 @ 13.50

Portland, Ore., November 25, 1919.

CATTLE—Strong; receipts, 95. Steers, best, \$9.50 @ 10.50; good to choice, \$9 @ 9.50; medium to good, \$8 @ 9; fair to good, \$7 @ 8; common to fair, \$5.50 @ 6.50; good to choice, cows and heifers, \$8 @ 9; medium to good, \$5.50 @ 6.50; fair to medium, \$4 @ 5.50; canners, \$5.50 @ 6.50; bulls, \$5 @ 7; prime light calves, \$12.50 @ 14; heavy calves, \$7 @ 12.50; stockers and feeders, \$8 @ 9.25.

HOGS—Lower; receipts, 328; prime mixed, \$15.50 @ 16; medium, \$14.50 @ 15.50; rough heavies, \$13.50 @ 12.50; valley, \$10.50 @ 11.50.

SHEEP—Firm; receipts, 105; Eastern lambs, \$11.50 @ 12.50; valley, \$10.50 @ 11.50; feeders, \$9 @ 10; yearlings, \$8.50 @ 9.50; wethers, \$7.50 @ 8.50; ewes, \$5 @ 7.

EASTERN.

Chicago, November 25, 1919.

Onions, Brown, sack \$1.00 @ 1.25
do, Yellow, sack \$3.25 @ 3.75
do, Green, Alameda Nominal
Garlic, lb. 20½ @ 22c

BEANS.

An excellent demand for beans coming from all over the country has put more strength in the bean market than it has had for some time. Many of the orders now coming in are for future delivery, as the eastern buyers evidently look for decidedly higher prices after the first of the year, and they want to have a good stock on hand at the present low quotations for California beans. Prices were advanced on several varieties because of these transactions and further advances will be made if the demand continues.

Vanety Old crop New crop
Borers \$7.00 @ 7.25 \$8.50 @ 9.00
Blancs \$5.75 @ 6.00 6.15 @ 6.25
Crabtree \$6.00 @ 6.25 7.25 @ 7.50
Pinks \$5.50 @ 5.75 6.15 @ 6.40
Red Mexican \$6.00 @ 6.25 6.75 @ 6.75
Tepary \$2.50 @ 2.75
Gardner 0.50 @ 1.00
Lima Whites \$5.25 @ 5.50 6.10 @ 6.25
Small Whites \$6.00 @ 6.25 6.15 @ 6.25
Limas \$4.50
do, Baby 13.00

POULTRY.

Turkeys made a sensational advance on Monday and Tuesday of this week on small receipts and a breaking down of the determination of buyers not to pay more than 45 cents for the Thanksgiving bird. Live turkeys advanced in sympathy with the dressed birds, but the demand was not large for them. For about a week buyers held out for 45 cents as the top for turkeys dressed, but Monday's receipts showed a scarcity the agreement, if there was one, was broken, and buyers began to bid against one another. In all other respects the poultry market is dead with few sales of any description. Nominally quotations are the same as last week.

Broilers, 1½ lbs. under 36 @ 40c
do, 2 to 3 lbs. 32 @ 36c
Fries, 2 to 3 lbs. 32 @ 36c
Hens, extra, per lb. 34 @ 35c

Ducks, young 28 @ 30c
do, old, per lb. 25 @ 27c
Belgian hares 16 @ 20c
Jack Rabbits \$1.50 @ 3.50

BUTTER.

The butter market continues quiet with a firm undertone that immediately "takes up the slack" if any tendency to sell below the market appears. Like last week the extreme fluctuation was only a half-cent. But this week it was a half-cent up while last week it was down from the opening and the close.

Thu. Fri. Sat. Mon. Tu. Wed.
Extra 64 64½ 64½ 64½ 64

EGGS.

Eggs continue to furnish the sensations of the Dairy Exchange. Extras advanced to the highest price on record in the local market. Quotations below are the prices with the commission deducted and represent the price paid the growers. The retailers paid 9½c, cents for his extra eggs today, and this is 1½c above the high price reached during the earlier part of the month. This increase in price is due to local conditions apparently as eastern quotations today are not materially changed. With eggs at 9½c to the retailer, the dollar egg is again in sight for the consuming public. Pullets and undersized advanced in price in sympathy with extras, each touching the record price of the year. A peculiar thing about the market is that, notwithstanding the fact that extras are at the highest point on record in this market, extra pullets are still 5 cents lower than the high of last November and a cent lower than the high of January of this year. A shipment of 1160 cases of selected extras from Petaluma to New York is recorded on November 21.

Thu. Fri. Sat. Mon. Tu. Wed.

Undersized 61 61 61 63 65

CHEESE.

The cheese market is very quiet with practically no trading except in flats, which are a half-cent weaker. There seems to be some inclination to keep stocks moving which has had the effect of stabilizing the market. California Flats, fancy 31½c
do, Firsts 27c
Y. A., Fancy 34c
Oregon Triple 30½c
do, Y. A. 34c

FRESH FRUITS.

Fresh fruits moved well this week owing to the approach of the holiday. Apples are in steady demand, but the special demand this week was for grapes. Figs are getting scarce and will soon be off the market. Strawberries are arriving, a few cases each day, and will probably continue on the market until the first rains.

Apples, Jonathan, Oregon \$2.50 @ 3.00
do, Spitzenberg, Oregon \$2.00 @ 3.00
do, Bellflower Nominal
do, Pippins, Calif. \$2.25 @ 2.50
do, Oregon, other \$2.50 @ 3.00
Quinces \$1.00 @ 1.50
Pears \$1.50 @ 3.00
Strawberries \$18.00 @ 20.00
Raspberries None
Grapes \$2.00 @ 2.50
Figs None

CITRUS FRUITS.

A good demand developed during the week for citrus fruits, but it has not equalled the expectations and was not enough to sustain prices. While there are no changes in lemon prices the price of both descriptions of oranges was lower and grapefruit also were cheaper. Mandarins are now on the market.

Table with 2 columns: Item and Price. Items include oranges, Valencia, do, Navel, lemons, fancy, do, choice, do, standard, grapefruit, and lemons, box.

DRIED FRUITS.

The market for dried fruits is steady. Practically all is now out of first hands, and a ready market for some time is predicted.

HONEY.

There is a constantly growing inquiry for honey in this market, owing to the sugar situation, and if honey prices are not advanced it is predicted that the sales in this market will develop. Prices were not changed this week and honey was strong at these figures.

RICE.

Rice showed some strength this week and 3 Siam Usual was advanced to \$10.60 for November and December delivery. The same description is quoted at \$11.00 for delivery in January and February.

HIDES.

The hide market is very quiet, though there is some little inquiry for country hides of the better grades. Quotations run about as follows:

Table with 2 columns: Item and Price. Items include Wet Salted Hides, Steer hides, Cow hides, Hides (15 to 30 lbs.), California (under 15 lbs.), Bull hides, Horse Hides, Wet Salted, Large, Medium, Small, Colts, and Ponies.

PELTS.

Long Wool, 9 to 12 mos. growth \$2.50 and up Medium Wool, 6 to 9 mos. \$1.50 to 2.50 Short Wool, 3 to 6 mos. \$1.00 to 1.50 Shearings, good, 1 to 3 mos. .25 to .75c

WOOL.

There is little movement in the wool market locally. In the Eastern markets there is a strong demand for fine wools, with some reaching out for the lower grades.

LOS ANGELES

Los Angeles, Nov. 25, 1919.

BUTTER.

Butter shows an advance of 1c over last week's prices. The market reports a very good demand. Receipts considerably higher than those of a week ago. For the week, 312,500 lbs.

Table with 2 columns: Item and Price. Items include Fresh, California extra creamery, do, prime first, do, first.

EGGS.

Fresh extras advance 2c. Case counts decline 1c while pullets remain the same. This market reports a good demand. Receipts are lighter than last week. For the week, 392 cases.

Table with 2 columns: Item and Price. Items include Fresh ranch, extras, do, case count, do, pullets.

POULTRY.

Turkeys are in very good demand for the

SUMMARY OF COLD STORAGE HOLDING DAIRY PRODUCTS AND EGGS.

The following is a tabulated summary of cold storage holdings of dairy products and eggs on the dates mentioned, and a comparison with holdings for the same period a year ago. It is compiled by the Bureau of Markets, U. S. Department of Agriculture.

Table with 5 columns: Commodity, Nov. 1, 1919, Nov. 1, 1918, Oct. 1, 1919, Oct. 1, 1918. Items include Creamery Butter, P. S. Butter, American Cheese, Swiss Cheese, Brick & Munster, Limburger, Cottage, etc., Cream & Neufchatel, Cheese, other, Eggs, case, and Eggs, frozen.

Thanksgiving trade. Heavy hens are also selling very well. On all others the sale is reported to be slow at quotations, which are the same as last week.

Table with 2 columns: Item and Price. Items include Broilers, 1 to 1 1/2 lbs., Broilers, 1 1/2 to 1 3/4 lbs., Friers, 2 to 3 lbs., Hens, Roosters (soft bone), 3 lbs. and up, Stags and old roosters, per lb., Turkeys, Ducks, and Geese.

FRUITS.

This market reports all choice to fancy in good demand. The tone of the market is firm. Receipts fair.

Table with 2 columns: Item and Price. Items include Grapes, Malaga, lb., do, Cornichon, lb., Pears, Bartlett, lb., Japanese Persimmons, lb., Apples—Bellfleurs, 4 tier, do, Jonathan, packed box, do, Red Permain, packed box, do, White Permain, packed box, do, Yellow Newtown Pippins, pld box, Spitzburg, packed box, and Quinces, lb.

VEGETABLES.

Offerings in this market are of fair quality, but receipts light. Prices holding firm for all choice to fancy stocks. Poor stuff hard to move.

Table with 2 columns: Item and Price. Items include Potatoes, Northern Burbanks, do, Idaho Russets, cwt., Sweet Potatoes, Onions, Stockton, yellows, cwt., do, White Globe, cwt., Cabbage, per 100 lbs., Lettuce, crate, Rhubarb, per 30-lb. box, Summer Squash, lug, Peas, per lb., Kentucky Wonders, String Beans, Green, Tomatoes, lug box, Lima Beans, local, lb., Cucumbers, local, lug box, Peppers, Bell, lb., Casabas, lb., Celery, crate, and Cauliflower, crate.

BEANS.

This market is still very dull, but prices remain unchanged since last week.

Table with 2 columns: Item and Price. Items include Limas, per cwt., Large white, per cwt., Small white, per cwt., Blackeyes, per cwt., Tepary, per cwt., and Pink, per cwt.

HAY.

Receipts in this market very light. Alfalfa quoted \$1.00 a ton higher. Grain hay firm. The demand is fair.

WEEKLY EGG AVERAGES.

Table with 5 columns: Ending, 1918, 1919, 1918, 1919. Rows for each month from Jan to Dec.

WEEKLY BUTTER AVERAGES.

Table with 5 columns: Week, 1918, 1919, 1918, 1919. Rows for each month from Jan to Dec.

ALWAYS
RELIABLE

Gombault's CAUSTIC BALSAM

SURE IN
RESULTS

THE ACCEPTED VETERINARY AND HUMAN REMEDY

A RELIABLE, safe and active blister and counter irritant--is used successfully by the very best stockmen everywhere. The very fact that it is both "reliable and safe" for anyone to use is of particular interest especially to those who are not veterinarians or within reach of one; and when you consider that many of the veterinary surgeons are buying and using it, you can well believe it is a valuable and reliable veterinary and household remedy.

NOT ONLY SEE WHAT OTHERS SAY, BUT SATISFY YOURSELF BY TRYING IT

CAUSTIC BALSAM AS A HUMAN REMEDY IS Penetrating — Soothing — Healing

It is generally true that an external remedy that is good for the animal is also good for the human body, and Gombault's Caustic Balsam is no exception to this rule. In fact, we sincerely believe that there is no liniment or external remedy on the market that is as good or as safe and reliable to apply to the human body as Caustic Balsam. We can safely recommend it in all cases where an external application could benefit. It is also cheaper according to cost because it requires very little and that little is effective.

A Safe and Reliable Germ Killer

Caustic Balsam, applied at once to any bruise or flesh wound, as soon as it stops bleeding and is thoroughly washed, will prevent blood poison and cause it to heal at once with scarcely any soreness. Persistent, thorough use will cure many old or chronic ailments, and it can always be used on any case that requires an external application, with perfect safety, and good results.

Veterinary surgeons use Caustic Balsam. Many recommend it. Why? Because it is a safe remedy for their customers to use and it brings satisfactory results.

Never Failed To Do Its Work

I am in the saw mill business and keep from twenty to thirty head of stock all the time. I have been using your Gombault's Caustic Balsam for the last ten years and I have tried it for every known lameness and it has never failed to do the work yet. I have cured swellings and never take them from the wagon. I have tried it on oxen's necks with good results. Hoping this will be some benefit to some stock owner.

Clarence J. Henley, Maplesville, Ala.

Information on special cases freely given. The accepted Human and Veterinary Remedy of the World.

Sure Cure For Rattle Snake Bites

Have used Gombault's Caustic Balsam for years and wouldn't be without it. It will not only do what is claimed for it, but it is also a sure cure for rattle snake bites, if taken in time. We have saved two horses and one cow with it. Thought you might want to put this in your list of cures, as so many use Caustic Balsam. It might save them a horse or cow some time if they knew about it.

S. H. Felt, Hartford, Michigan

Caustic Balsam will absolutely remove all poisonous secretions and create a healthy action.

Caustic Balsam Does More Than Claimed for it.

Enclosed please find draft for which send me one dozen bottles of Gombault's Caustic Balsam. I have been using your Caustic Balsam for four or five years and it does more than you claim for it. A neighbor, Mr. Seegar, had a horse with a bad case of swellings. He could not sell the animal for \$25.00. I advised him to use your Caustic Balsam and he did so, curing the horse, and has since refused \$100.00 for her. My niece had her knee badly injured by falling from a wagon. The doctors failed to effect a cure and she began using Caustic Balsam. She is now practically well. I have also known it to cure neuralgia and stop tooth-ache. It is one of the finest medicines for man and beast. H. D. Sweazy, Beecher City, Ill.

Does Away With Firing TO WHOM IT MAY CONCERN:-

I have made many fine cures with Gombault's Caustic Balsam. I have cured bowed tendons, capped hocks, lints, ringbone, sidebone, shoe boil, quitters, poll-eyil, fistula of withers and many other long standing cases. It is either a mild blister or a fine counter irritant; does away with firing.

E. L. Seltzer, Shelltown, Md.

Caustic Balsam Does More Than Guaranteed

I have used Caustic Balsam for the last seven years and found it just as it was recommended, and even more, because it will cure where other medicine fails and I can prove it. I can certainly recommend it.

J. T. Sullivan, Chebanse, Ill.

Twenty Years Success With Caustic Balsam

After using Gombault's Caustic Balsam for twenty years I can say it has never failed to do all you recommend it to do. While it seems high to one that has never tried it, once a customer always one. I have used it for twenty years and use no other but it. W.A. McCauley, Malone, Tex.

Good For Any Cut or Bruise

I recommend your Caustic Balsam for any kind of rusty nail or barb wire cut and has also cured bad cases of blood poisoning. I am a veterinarian and surgeon and I recommend to any man this Caustic Balsam as a cure of what I said.

F. Max Scheibe, V.S., Dulce, N. Mex

CAREFUL FARMERS

USE CAUSTIC BALSAM

A Safe and Reliable Anticeptic

Do you turn your horses out for the winter? If so, we want to call your attention to a very important matter. Horses which have been used steadily at work, either on the farm or road, have quite likely had some strains whereby lameness or enlargements have been caused. Or perhaps new life is needed to be infused into their legs. Gombault's Caustic Balsam, applied as per directions, just as you are turning the horses out, will be of great benefit; and this is the time when it can be used very successfully. One great advantage in using this remedy is that after it is applied it needs no care or attention, but does its work well and at a time when the horse is having a rest. Of course, it can be used with equal success while horses are in the stable, but many people in turning their horse's out would use Caustic Balsam if they were reminded of it, and this article is given as a reminder.

Found Nothing That Equals Caustic Balsam

Kindly permit me to express my deep appreciation of Gombault's Caustic Balsam. I have cured sprains, ringbone, strained tendons, swellings, poll-eyil with it in fine shape and do not see how a better liniment could be manufactured. I have used many things for removing pulls from horses but have never found any that would equal Caustic Balsam. I also had a cow that had lump jaw. I used Caustic Balsam and cured it.

John H. Wallgren, Logan, Kansas

Bunches on horses or any other livestock are unsightly.

Caustic Balsam Prevents Blood Poison

We have used Caustic Balsam for several years and have found it to be unequalled for horses or people. My husband ran a rusty nail in his hand and blood poison set in. We used two applications of Caustic Balsam and the swelling and fever left his hand and arm and it healed up without any more bother. It is also as efficient for snake bites and we would not think of being without it.

L. H. Globe, Forest Grove, Mont.

Caustic Balsam is good for that sore feeling after baseball or football games.

A Splendid Human Remedy

I think your Caustic Balsam a splendid human remedy. We use it for cuts, burns, sores, swellings, sore throat and lameness and find it very beneficial. We expect to keep it on hand ready for any emergency.

Mrs. Robt. B. Newton, Columbus, Miss.

The world's greatest and surest veterinary and human remedy. Has imitators, but no competitors.

Worth Its Weight In Gold

I have used Gombault's Caustic Balsam for my own horses and for others, and it has never failed yet. My little girl had rheumatism for a long time. Nothing did her any good until we used Caustic Balsam and she is all right. My wife had throat trouble and used Caustic Balsam with great results. It is worth its weight in gold.

Dr. Ira Le Dunlap, V.S., Rochester, Pa.

Gombault's Caustic Balsam As a Liniment for the Human Body has no Equal

A Liniment that benefits; it kills pain. A home remedy for the Human Family

ALL TESTS prove the wonderful efficiency of Gombault's Caustic Balsam in relieving human ailments, such as Rheumatism, Neuralgia, Sprains, Sore Throat, Sore Lungs, Chest Cold, Backache, Lumbago, Diphtheria, all Stiff Joints. It is penetrating, soothing and healing, and for Old Sores, Bruises or Wounds, Felons, External Tumors, Cancers, Boils, Corns or Bunions Caustic Balsam has no equal. It removes the soreness and strengthens the muscles—in fact aids all troubles where an external application is necessary. We would distinctly say to all who buy it that it does not contain a particle of poisonous substance, and therefore no harm can possibly result from its use.

THIS GREAT REMEDY literally works wonders! It removes bunches on horses and other livestock, thereby increasing the value of the animal fully 50 percent. A successful treatment for Curb, Splint, Sweney, Capped Hock, Strained Tendons, Founder, Windpuffs, all Skin Diseases or Parasites, Thrush, Diphtheria, Pink Eye, and Lameness from Spavin, Ringbone, and other Bony Tumors; also all obstructions in circulation, and imparts new life and vigor. It is a peerless remedy for all Throat and Bronchial Troubles.

WHY! Because Caustic Balsam can be applied by anyone with safety, will do its work well and in no way injure the horse, while other blisters need daily attention and care and then are liable to leave a blemish.

If you have a lame or unsound horse, YOU CAN WELL AFFORD TO TRY A REMEDY THAT IS SO HIGHLY RECOMMENDED. Information on special cases freely given on request.

It is FAR SUPERIOR, MORE ECONOMICAL, and a PERFECTLY SAFE, RELIABLE and PROMPT Remedy to use as compared with any other remedy used for like purposes.

The demand is produced strictly by its merits.

Sulphates Increased Alfalfa 1,000%

Written for Pacific Rural Press by R. E. Hodges.

ALFALFA YIELDS have been increased fifty to one thousand per cent by use of small quantities of sulphur fertilizers in careful experiments of the Oregon Agricultural College, covering eight years on various ranches, including a great variety of soils.

These experiments had been under way three years when Prof. F. C. Reimer wrote an article on the subject for the Pacific Rural Press, issue of June 27, 1914. They have been continued to the present and their results have lately been published.

Curiously, they have conclusively proved a fact in fertilization which had been overlooked in scientific investigations of all history previous to a decade ago. We have been told by practically all the authorities that we need worry about only three plant foods in practicing fertilization.

Sulphur Necessary but Deficient.

Plants require ten different elements, but only three were considered in practice and in experimental work. Nitrogen, phosphorus, and potash are the three. The most available form of phosphorus is superphosphate; but superphosphate gave remarkable results where other forms of phosphorus did not. Superphosphate is about one-eighth sulphur. Sulphate of potash gave results where other forms of potash did not. This fertilizer is about one-fifth sulphur. Sulphate of ammonia gave results where other forms of nitrogen did not. This is about one-fourth sulphur. Gypsum gave as good results as any of the combinations of sulphur with the recognized fertilizer elements. Gypsum contains none of the three fertilizer elements, but is about one-sixth sulphur. Flowers of sulphur gave nearly as good results for an average of four years as the other forms of sulphur. This is 100 per cent sulphur, but must be changed into a sulphate combination in the soil before plants can use it.

Uniformly in the many experiments with alfalfa on many varieties of soil, the application of common fertilizer elements increased the yield very little, while almost as uniformly the application of materials containing sulphur gave remarkable increases in yield, in color, in quality, and in freedom from weeds. The practical question then became, Which form is cheapest and how much actual sulphur is economical?

Sulphur 100 Pounds per Acre.

Most of the sulphur fertilizers were used in the experiment in an amount which would supply 100 pounds of sulphur per acre. In several cases, however, more was used. With 300 pounds per acre and with 600 pounds per acre, there was not enough increase over the yield from the 100-pound applications in the average of four years' crops to pay for the extra sulphur. With 600 pounds the tonnage for four years was considerably less; for this was applied as flowers of sulphur, which had to change into sulphuric acid before it became an available sulphate. The sulphuric acid was harmful in these quantities, though the California Experiment Station has shown that sulphuric acid is a benefit on alkali land if properly applied.

Sulphur Increases Roots and Tops.

The various sulphur fertilizers had a very stimulative effect on the alfalfa root systems, increasing their growth and the number of nodules. This enabled them to take up greater quantities of other plant foods, mois-

ture, and atmospheric nitrogen. This made the top growth heavier and stronger in protein. It smothered the weeds, which grew abundantly in the plots fertilized with other elements.

Alfalfa hay from sulphur-fertilized plots contained .049 per cent to 0.1 per cent more sulphur, and 0.93 per cent to 1.89 per cent more protein than that from check plots. The greatest difference noted was on loam soil, where the sulphur-fertilized alfalfa contained 15.7 per cent protein.

One check plot produced hay containing only 2.54 pounds of sulphur per ton. It yielded at the rate of 2,160 pounds per acre. A fertilized plot produced hay containing 3.34 pounds of sulphur per ton. It yielded at the rate of 10,020 pounds of hay per acre; and this hay was all alfalfa, while with the smaller yield a large proportion of it was weeds.

Soil Analyses Proved Nothing.

The soils used in the experiments were analyzed. The analyses gave data which were surprising when compared with results of fertilization. One soil with .038 per cent sulphur in the surface soil and .025 per cent in the subsoil gave remarkable increase when fertilized with sulphates; while another of practically the same chemical composition gave no response to sulphur fertilization. This is considered due to difference in physical character of the soils which permitted the sulphur in one to become available faster than in the other.

Various Forms of Sulphur.

The various forms of sulphur which have produced such striking results were flowers of sulphur, superphosphate, iron sulphate, sulphate of ammonia, sulphate of potash, sulphate of magnesium, sodium sulphate, and calcium sulphate (gypsum). Some of these, such as sodium sulphate, would be objectionable on account of the residue left after the sulphate is used. Several are altogether too expensive. Some, such as superphosphate, and sulphate of ammonia, are highly desirable if phosphate, or nitrogen, are needed in the soil. These elements were already plentiful in the Oregon soils used, but they are deficient in a great many soils. In such deficient soils, the extra cost of these forms is justified.

Calcium is also plentiful in the Oregon soils; but is not so everywhere, and may well be supplied in the form of gypsum or lime. Gypsum is probably the cheapest form of sulphate fertilizer; though the sulphur in it probably costs more than the fertilizer grade of flowers of sulphur. Its greater availability, its harmlessness, and the other advantages of gypsum combine to make this product probably the most desirable fertilizer for alfalfa unless phosphorus, nitrogen, or potash are deficient.

Our California Experiment Station also emphasizes the fact that soil analyses do not furnish a safe basis for plunging in fertilizers. Our recommendation would be to try three or four forms on acre sections of a uniform field—say, superphosphate on one, gypsum on another, sulphate of ammonia on another. The chances are that sulphate of potash will not be worth its cost in most cases. Those who want to get the benefit of increased crops on a reasonably safe bet the first year may well spread gypsum up to 600 pounds per acre on a considerable acreage this fall. It will supply about 100 pounds of sulphur. If the land leaches badly, spread shortly before growing season.

Which stack would you rather grow from the same acreage? Sulphate fertilizers, including pure sulphur and gypsum, have increased alfalfa crops sensationally where sulphur was too scarce in the soil.

NEW UNIVERSITY PRESIDENT.

ON TUESDAY of this week Col. David P. Barrows was chosen President of the University of California, to fill a vacancy caused by the retirement of President Wheeler in July last. The new incumbent of the presidency is eminently qualified by natural endowments, training, experience and notable attainments in scholarship and in public affairs for the important duties entrusted to him. During the last 24 years he has been connected with the University (except when abroad on national duties), first as graduate student and afterward as instructor, and has honored himself in the eyes of his faculty associates by his excellent instructional and executive work, his unswerving devotion to his duties, and by his services to the public, which grew out of his university research and his instructional experience. The choice of Col. Barrows to the presidency, therefore, meets the desires of his academic associates and of Californians generally, who have reason to look forward to a long, active and successful career for him in his new position. He is but 46 years of age, possessed of abounding health—a man to whom vigorous action of both mind and body seems a continuous pleasure. The University is indeed fortunate to have such a man at the head of its executive affairs.

From our particular point of view we are especially gratified with the selection of Col. Barrows, because all his attainments as a scholar, teacher and publicist are imposed upon a background of California rural life in which his youth was passed. He knows the State and the agriculture of the State—the latter in all the breadth and depth of its diversity and the needs and requirements thereof—and his participation in the agricultural leadership of the University will be of direct benefit and incalculable value to our greatest and most expansive industry.

SOME WEATHER!

Nature, celestial aviator par excellence, has dropped some meteorological bombs on the garden spot of the western hemisphere since our last issue—and it will take quite a run of our normal salubrity to expurgate them from memory. It is true, of course, that they were not TNT bombs, such as fell on the Rocky Mountain and eastward fragments of the country, breaking up nearly everything but the coal strike and paralyzing all business but politics. Our weather drives were of the kind ordained from the beginning for shorn lambs, but according to our depth of fleece and degree of endurance, they surely did lambast us sore. Whether they were gales carrying sand to "frost" the windshields of automobiles which persisted in facing them on our valley highways, or whether they were gentle zephyrs dropping snowflakes like feathers on our mountains, they were quite enough of their several kinds, and we are not wishing for more blizzards to hit other parts of the country that we may be stroked by the soft sides of them. As we write after about a week of their visitation,

we have to conclude that these weather-samples have not been so valuable for the amount of wetness they have brought as for the disposition which they betoken on the part of the firmament above not to float over us in everlasting summer, but to get busy in throwing down the stuff which makes crops. On Tuesday the weather-pranks are still playing and the Weather Bureau sees in them assurance of a real rain which we hope will come, not alone for the water it will throw down, but also for the spirit it will lift up from the pessimism of the unmantled weather prophets, which prescribes that if rains do not come very early they will not come at all until Christmas. We doubt if such a view is justified by the facts and, if it be in most cases, we are probably in for an exception this year, as the disturbances of the week indicate. Besides, those who like the prophecies of the sun-spotters and planetary-conjugators can find assurance in their utterances that December this year will be a month of storms which will live in history, and we shall be in luck if we are not all drowned by Christmastide. Therefore, agriculturally speaking, it is up to all farmers to get in their tools and seeds just as fast as the soil allows, with full confidence that all who survive the December storms of this year will live happily ever afterward.

SAN DIEGO ARRIVES!

It is perhaps not kind to suspect San Diego of causing all the aerial disturbances of the last week, and yet that seems a more reasonable assumption than to credit it to sunspots and planets which do not care a whoop for California development. For San Diego has really arrived as the western terminus for a straight-away eastward railway, and cannot be blamed even for stirring up the skies in her celebration thereof. It is nearly sixty years since San Diego began to believe that her natural harbor and salubrity would surely connect her up with a direct line of overland railway, and though she has had many disappointments during all the time she has lived amid the wreckage of financiers and realty promoters, San Diego has never lost faith that her peerless bay and climate would finally put her on the world-map of population and great trade-routes. The experience of San Diego gives the lie to the old declaration that hope deferred maketh the heart sick, for she has lived a stout-hearted and generous struggle from her first dreams to the day of their realization. And yet cruel fate, which has tried her sore, flung a parting defiance in her smiling face; for this is the record of San Diego's last Thanksgiving as an unattached community:

SAN DIEGO, November 27.—What is said to have been one of the heaviest snowfalls ever recorded in the mountain section of San Diego County covered that territory today, making unusual Thanksgiving weather for many resorts. General Manager Pontius of the San Diego and Arizona Railway, whose formal opening will be celebrated next Monday, announced tonight that snow from five to seven inches deep lay on the tracks of the road in the mountains between San Diego and Imperial counties. This, he added, was not a serious matter so far as railway operation is concerned and can interfere in no way with the opening. He said, however, that from reports sent to him this snowfall was unprecedented and was still falling tonight.

And so San Diego, naturally beautiful, capable, confident, was led to her world-marriage in a snow storm! Snowflakes nestled among the orange blossoms in her fragrant tresses; arctic blasts tugged at her silken robe and a premonitory pneumatic chill pierced her abounding bosom. But even the fact will not be so grievous as the use which rival resorts in our sunny south will make of the fact. San Diego must be brave and remember that

They who ascend to mountain tops will find

Their loftiest peaks most wrapt in clouds and snow;

So they who conquer or subdue mankind

Must look down on the hate of those below.

Had San Diego been content to live forever in her embowered beauty; had she been content to linger always in her sunny outlook upon quiet waters with no restless ambition to figure largely in the world beyond, neither snow nor blast could have reached her in the sweetness of her idleness. But when San Diego scaled the eastward mountain bar-

rier of her encirclement, she had to face the trials of all those who essay to climb. But San Diego's most severe affliction was her last. Henceforward forever she will shine as a gem of purest ray serene in one of the world's great circles!

THE MEANING OF IT.

We probably owe an apology to sturdy old Saint James, who gave his name to our southmost city and county, for feminizing his attributes in such a shameful way, but it is almost irresistible when one is filled with worshipful admiration for a city, a river, a tree, an air-plane or a race horse, to rise to terms of the feminine, and so we "let her go Gallagher." And lest it be taken that we share in any gibe at San Diego and her snowstorm, we desire to say that the realization of San Diego's old ambition for directly eastward connection by rail and her lack of satisfaction of being sidled into by a spur of an overland line, have resulted in a great thing for the whole state. The short-line opening to sea water in San Diego bay will be of incalculable advantage to the great Imperial Valley and its environs along the Colorado River. No one can yet estimate the amount and variety of products which the extreme southeast of California will pour into the courses of world-trade. To limit them to roundabout railing or to carry them to harbors insecure or unopen to all kinds of shipping, is unfair to the whole Colorado river region. Therefore we are very hopeful that Mr. Pontius will pilot his trains through the mountains which lie between sun-kissed San Diego and sun-burned Fort Yuma, and never again have a snowstorm to cover his rails. The opening of the new line, if we count straight, gives California six straight east and west cuts by overland railways, and now if there is possible a short line overland which can cut into the Humboldt Bay region we hope engineers and promoters will give attention to it.

WORTH-WHILE AMERICANIZATION.

An American girl has just started a good job of Americanization which should not pass unnoted. We hear a lot about the duty of Americanizing the foreigners who have come to us, and we believe it is a true and necessary public policy which should be earnestly promoted. But for dash and picturesqueness no Americanization to save European raff from destroying us with anarchy can compare with the achievement by which Lady Astor, daughter of our State of Virginia, became the first woman-member of the British House of Commons, and was welcomed thereto by great cheering by those who thus became her political peers. For Nancy Lady Astor was not born to her berth, but was elected to it on the basis of personal worth and patriotic deeds, by the electorate to which her sex was recently admitted, and she became the first woman qualified to write M. P. after her name. The event is colossal when one seriously considers it in its significance in the ennoblement of woman to their just sphere, and it is strikingly picturesque in its other bearings. From the state which bears a name which is a tribute to that most distinguished Englishwoman, Queen Elizabeth, there returns to England in the third century afterward a Virginia girl to take honorable place in the great, popular legislative branch of the British government. Is not this a great stride in Americanization? It occurs to us that John Bull is the biggest game in the whole jungle of Americanization. He has high place in the world, he has property which gives stability and purpose, he knows how to behave humanely and he is held to be the greatest devotee to fair-play in the world. What a great start is that toward Americanization! We feel this whole matter so keenly and we see in it such an opportunity for world renovation, that we must cry out across continents and oceans: "Go in, Nancy; we will hold your bonnet!"

And there is another thing about it all which is hardly less picturesque in another way. Nancy Astor is a commoner, destined perhaps to become one of the few "great commoners." To emulate her success or even to sit beside her in the House of Commons, her husband can never attain. By becoming his father's successor to an earldom he can never again become a commoner like his wife, and he can never vote supplies upon which the

future of the nation will depend. Be gentle with him, Nancy, for the sake of old times. It is really not his fault; he was born that way and they say he is a pretty good sort.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Barley or Melilotus.

To the Editor: I have about 9 acres which had a crop of barley this last year, but the land is not leveled for irrigation. The land runs together after rain, but does not crack open as adobe. Would you advise me to sow all or part of this land to sweet clover (*Melilotus alba*) as pasture for cows and turkeys. It is very dry now and "old timers" say "no rain till Christmas." Would it be well to sow before the rain or after? Should land be plowed, or seed just cultivated in?—O. P. D., Orland.

The clover would be good for the land and help to cure its cement-like action as well as add to the richness of it, but we are not sure that it will please you as a feed-crop. Cows do not take readily to it unless their appetites are pretty well sharpened. We cannot answer for turkeys, but presume it would be a good change from mullein. It is a good deal of a question as to whether you wish to serve yourself or your land first and for your immediate use perhaps a green-feeding crop of barley or rye would be a better way to serve both yourself and the land—for the pasturing would help the latter considerably and help carry your stock. Sweet clover should be sown early to start while the land is still warm. We would not wait until after the rains, but plow to get in all the seed mentioned and to get more water into the land also.

For Apricot Troubles.

To the Editor: Please give the best time to spray apricot trees and name of best spray for scale and moss on old apricot trees. Is there any spray that will help to destroy brown rot, and when to spray? What is the cause of buds being killed on apricot and cherry trees? Some cherry limbs do not have any fruit buds or growth buds for two feet.—H. A. F., Mountain View.

The large lecanium scales which usually infest apricot trees are best treated with a distillate spray applied earlier in the fall, but they may also be considerably reduced by lime-sulphur, applied as soon as you conveniently can after this date—after getting your pruning done. Lime-sulphur will also kill the moss and will clean the bark of spores of brown rot, if you prune off all the "mummied" fruits which may now be sticking on. Brown rot causes death of many buds and twigs, although there is a bud-blight caused by other fungi. The best you can do for all these is lime-sulphur wash, shot on hard with a force sprayer which will drive the spray through the moss and into all crevices.

Corn Stubble Land.

To the Editor: I have some corn stalks on land that I want to plow. Can I plow satisfactorily without getting rid of the stalks first? They are rather short. If I have to get rid of them, what is the best way to do it? Will running a disc harrow over them do the work satisfactorily, or should I cut them and haul them off?—H. G. M., Paso Robles.

It depends something on the land and the use you plan to make of it. If the land is heavy and you can plant late and have plenty of rain, you can roll down, disk and plow under the rubbish. If your land is light and to be early sown, you had better roll and rake into windrows and burn before plowing—getting off all you can, for the trash will dry out the land too much. Why did you not let the stock go at the problem a month or two ago?

Alligator Pears.

To the Editor: In what States do alligator pears grow, and on what kind of trees? I am under the impression that the trees are similar to any other pear tree. Why are they called alligator pears?—Subscriber, Novato.

The avocado grows in Florida and California. It seems to be about as hardy as the orange. The tree is an evergreen with rather thick leaves and may attain a height of fifty feet or more. It looks nothing like a pear tree and the fruit is no kind of a pear. It was perhaps called "alligator pear" because alligators may eat them in Florida, or because some varieties are dark-green and dam-

dismal looking when mature and some varieties are somewhat pear-shaped. We do not know how the name started, but it ought to be stopped.

Value of a Leasehold.

To the Editor: A has a lease on B's ranch for 5 years. B wishes to sell his property. What redress, if any, has A? What can he require B to pay him for his time and expense in moving on B's place? The lease has 4 more years to go.—F. B., Loomis.

If A has a properly drawn lease without reservations, which gives B no permission to terminate it (except upon the basis of A's delinquency or transgression of the terms of it), B cannot sell the property except as subject to the lease given to A. If B desires to regain the right to give immediate possession to a purchaser he must buy back A's lease at whatever terms they may agree upon. If A has not complied with every condition incumbent upon him, B can sue him off the place. If A's position is impregnable he can compel B to pay him reasonably for releasing the property. The amount depends upon how much the right to possession and use can be reasonably estimated to be worth.

Figs and Prunes.

To the Editor: How shall I plant shoots from chopped-down fig trees next spring; also is it advisable to cut back 5-year-old prunes, which did not bear, but made too tall limbs, some 9 to 10 feet high?—L. E. B., Lower Lake.

We take it you ask how to grow fig trees from shoots grown from stumps of old trees. Such shoots are apt to be of rank, soft growth and not well suited for rooting. However, take the smaller shoots which seem to be hardest or best-matured wood. If you have none such, take the bases of the larger shoots with the hard attachment to the old wood below and up to a joint above—pieces about eight or ten inches long. Take these after the leaves have all fallen and put them in a box or bed of sand in a warm place and keep moist but not wet. This will heal or callus the ends and perhaps start small rootlets. When in this condition plant out—after the soil becomes warm and the danger of being soaked in cold water from winter rains is over.

Do not cut back the prune branches, but remove some of them entirely if they crowd or run across each other. They should bear in the coming season.

Cow Peas on Summer Fallow.

To the Editor: If I work my summer-fallow well and sow cow peas on it about the 15th of April and pasture it off, will I get a larger crop than if I did not plant anything on my summer-fallow and kept it well worked during the summer? I have been told that I would lose no moisture if I sowed cow peas as above mentioned. Is that so?—Subscriber, Contra Costa.

It is not so. If you allow cow peas to drink up the moisture which you are storing by summer-fallowing, how can you let it go and keep it also? But if your summer-fallowing is not primarily to save moisture (for there are other reasons for doing it), and if your land is moistened otherwise, or if the following rainfall is all that a large crop requires, you may get more grain after pasturing cow peas on the land than you would from a bare fallow. Results depend on conditions.

Faint but Pursuing.

To the Editor: The medicine which you prescribed for my horse did him no good. Can you give me some information about my bees?—R. L., Sonoma.

We have to acknowledge that the trust and forbearance of our readers are our greatest resources. Common people would have written: "Your medicine did my horse no good; I would not trust you to doctor a bee"—but not so with our selected constituency. They believe in probing the mass of our ignorance until they find something we do actually know. We did the best we could for the bees by mail and sincerely hope our confiding subscriber did not get stung again.

About Cherries.

To the Editor: What is the difference between the Royal Ann and Napoleon Bigarreau cherries? Also, which is the better root for cherries—mazzard or mahaleb?—J. C. B., Beaumont.

There is no difference. For a good depth of soil and continuously adequate moisture, with drainage to prevent accumulation of water, the mazzard

is preferable. Where there may be less favorable soil and moisture conditions the mahaleb is held to be more hardy against such adversity.

Upland Rice.

To the Editor: Has upland rice ever been grown in California. A number of years I saw it growing in Southern Georgia. It was well filled and looked to be a fine crop. I believe in Japan they grow it some for feed. Any information you can give will be interesting, I believe, to many.—D. P. P., Modesto.

Upland rice has been agitated in this country for half a century within our memory, and has never scored any commercial significance. Perhaps in our revolutions we may come to dry rice, but so far all the rice that counts is of the wet habit of growth.

Feeding Frosted Beans.

To the Editor: Kindly tell me whether pink beans that have been frosted (some ripe, some green) will hurt milch cows, if beans and straw are all fed together. If it will, what is the food value of beans thrashed out for hog feed?—F. M. B., Hanford.

There is nothing poisonous about beans and bean straw which have gone through a frost. The action of the frost is, however, such that the juices are spent and the material is less acceptable to stock and perhaps less digestible than when dried without frosting. In the latter case some trouble might be apprehended from feeding too much frosted fodder of any kind. The digestive disease known as murrain is sometimes traced to confining stock to such fodder, which they will not usually take too much of if they have also other feed. Beans are very nutritious and comparable as to contents with alfalfa hay. They should, however, be crushed and soaked and not fed alone nor in too great quantities.

The satisfactory adjustment of the mill strike in New England has given strength to the cotton market. Work has been resumed in many mills.

CALIFORNIA WEATHER RECORD

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending December 1, 1919.

Winter Protection from Summer Injury

A group of troubles that can be remedied next summer—act now.

(Written for Pacific Rural Press by W. T. Horne, Univ. of California.)

The past year has seen much loss of fruit trees from troubles which are due to climate and not to some insect or fungus against which the fruit growers can act directly. The methods of studying climatic injury have not been simplified as have some other phases of plant pathology. Nevertheless, certain diseases are known to be due to climate and something is known of the conditions within the plant which make them possible and some measures for reducing the danger can be taken.

Sour Sap Preventable.

Sour sap, meaning certain sudden dying of trees or branches in spring, is a result of cold shock on trees in exceedingly active new growth. Protecting the trees against high temperatures within the trunk and branches and so avoiding the stimulation to excessively active growth early in spring is the main preventive measure. A good coat of whitewash will reflect a considerable part of the heat from the sun on bright winter days and prevent much of the rise in temperature within the limbs and twigs which starts growth unseasonably. The rest period is thus preserved for a longer time without interruption. A tree properly nourished and coming normally into its winter rest period in the fall will be less liable to injury than one weakened by lack or excess of water, red spiders, injudicious late summer pruning, or other cause.

Water-logging of the soil at any season may cause symptoms like sour sap. Whitewash is not recommended in this case.

Winter Die-back.

Winter die-back in walnuts, figs many other trees, affecting especially young and vigorous plants growing under very favorable conditions is a drying out of imperfectly ripened wood under conditions of exposure to low temperature and excessive atmospheric drying. Lack of soil moisture in winter may accentuate the trouble. Many young walnut trees have been observed to lose their leaves by freezing and not by natural ripening this fall. The ends of the shoots and their buds are not fully matured, that is, they have not accumulated a proper store of reserve plant food, and with leaves gone no more can be elaborated this fall. This is shown by a soft green succulent texture and much flattened or angular outline as opposed to a stiff woody texture, round

outline and brown color. What these trees need to bring them through as well as possible is adequate moisture in the soil and protection against excessive atmospheric drying and against warming up by the winter sun. A good coat of whitewash is the most practical measure for protecting the top. Where the immaturity is noticeable clipping off the most immature parts of the shoots will doubtless be beneficial by reducing evaporation.

Trunk Injury.

In recent years many young, vigorous trees have shown serious injury to the trunks, especially at the surface of the soil. Trees up to several years of age may be affected, but it is especially the younger ones which are liable to suffer. The inner bark and wood in the vicinity of the cambium are affected and often the tree is girdled. Early in the season nothing is visible unless the trunk is cut into. Oranges, prunes and various trees have suffered and often under most favorable conditions in the best lands. The injuries do not become apparent until the following summer, when the trees suddenly fall and the most intelligent and observant growers have suspected fungus or other infectious diseases. More or less gummosis may accompany the trouble and probably there is often complications with various infections. Low temperature affecting trees which are imperfectly ripened because of excess vigor is the cause of this trouble. The conditions when discovered should be treated by cleaning the wounds and disinfecting with Bordeaux paste, but much may be done in the way of prevention by coating the trees in winter with whitewash and protecting the crowns either with loose earth or by wrapping with cornstalks or similar material to prevent warming up by the winter sun. When frost danger is completely over the coverings should be removed, since they may harbor pests or by the moisture occasion brown rot or other infections.

Frozen Roots on Nursery Trees.

Every year many nursery trees come to the Agricultural College—some before, some long after setting—which have had the roots dried or frozen, or both. When the bark of the roots is cut into it is found to be rather dry and has dead brown specks or spots. Such trees fail to grow and become a source of serious loss. Professor J. C. Whitten has given us un-

published data showing that the roots of even hardy trees are very tender to cold and are easily injured by even slight freezing. The roots of all nursery stock should be protected from drying and from the slightest frost. It appears that there is danger of injury, both by cold and drying, where the digger is run under the trees and they are allowed to stand before lifting.

Many trees from nursery shipments show a dark, water logged condition in the sapwood, the bark being normal. Such a condition has been traced in many cases to winter flooding or other water injury in the nursery often combined with freezing. Such trees should not be sold as first class, but if they are set under favorable conditions and get a good start they will often make good trees.

Deciduous nursery trees have sometimes been infected with the brown rot fungus of citrus fruits or a very similar one when heeled in a wet situation, causing the bark to rot. Nursery stock on receipt by the orchardist, or at latest on planting, should be whitewashed and given most careful attention to prevent freezing of roots or drying.

Black heart of apricots appears from study by approved pathological methods to be caused by a fungus. However, since only young and succulent trees are affected, winter injury may be a pre-disposing condition and winter whitewashing should help to prevent this.

Protect Young Trees from Frost.

Certain plants, like young citrus trees, avocados, or young figs in very frosty localities, may not be sufficiently protected by whitewashing, and should have covers of burlap, cornstalks, tules or some other convenient material with the soil mounded up about the crowns of the trees. Some plants, like tomatoes, gradually lose vitality and die in a continuous low temperature without actual freezing.

An excellent discussion of these topics is given in Bulletin 218 of the California Agricultural Experiment Station, by R. E. Smith and E. H. Smith, and in Bulletin 231, pp. 372-373, fig. 90. These bulletins are not now available for distribution from the University, but should be accessible in public libraries and many private libraries. In Bulletin 218, pages 1051-1052 treat obscure freezing, 1053-1055 winter sunburn and peculiar effects

of disturbing the rest period, 1067-1069 die-back and other injuries from winter drouth and cold, 1069-1071 and 1074 effects of excessive soil water in winter and drouth in summer, 1065 and 1098 sour sap, 1155 pear black leaf, 1177 die-back of young walnut trees. California Experiment Station Circular 204 discusses sour sap, etc., briefly.

Whitewash is Most Valuable.

Measures for preventing winter injury consist then in securing as favorable moisture conditions in the soil as possible with irrigation or provisions for drainage where needed, and in whitewashing the trees in early winter. Carefully conducted experiments by Dr. J. C. Whitten, now Professor of Pomology, University of California, have shown that a good coat of whitewash reflects the heat of the sun from the limb or twig instead of allowing it to be absorbed, so that a twig that is not whitewashed warms up much more than one which is well coated. This rise in temperature greatly accelerates evaporation from the twig, causing it to dry out. It also tends to break the rest period, causing a slight growth prematurely. This invisible starting to growth greatly weakens the resistance of the buds and tree generally. A whitewashed branch may not be visibly different from another in spring, but actually may be in much better condition, as shown by resistance to winter injury and subsequent success in setting and maturing a crop.

A good whitewash should stick until spring. Bodies, main limbs, and as far as practicable the whole tree should be covered for most complete results. The following formula is suggested:

Quick-lime 5 pounds
Salt ½ pound
Sulfur ¼ pound

Slake the lime slowly with water and add the salt and sulfur while it is boiling. Add enough more water to make a good wash. This is good for whitewashing the bodies of trees in the fall.

This whitewash should also have considerable fungicidal value and help in preventing certain serious winter infections. It may be applied with a brush or strained and applied with a sprayer. We have no intimation that whitewashing can ever injure a tree in any way or in the least measure.

Do Hay Prices Force Dairymen to Quit?

(Written for the Pacific Rural Press by Prof. F. W. Woll.)

The question has been raised how much a dairyman can afford to pay for alfalfa hay and continue in the dairy business. There are many factors that have a bearing on this question, and a full discussion of them would take up considerable space; in fact, it involves the entire subject of dairy economics. A brief mention of the main factors may, however, suffice and will be of interest to many subscribers.

The returns that a dairyman secures from his herd depends more on the kind of cows he has than on any other single factor. He may have cows that will average less than half a pound of butterfat a day, or such as produce one or one and one-half pounds or more per day for the entire lactation period. Cows do not begin to differ as much in the amount of feed they eat as in their production, since the latter is determined by the feed eaten over and above maintenance requirements for repair of body tissues and the continued exercise of vital functions. About one-half of the feed eaten by dairy cows goes to provide energy for body maintenance; the other half is used for the elaboration of milk, and

stands in direct proportion to the amount of the milk secretion. An average dairy cow will eat about 25 to 30 lbs. of alfalfa hay per day, depending on the quality of the hay and its water content; 25 lbs. is a good average figure, and she will produce on this feed about three-fourths of a pound of butterfat. In other words, it takes approximately 33 lbs. of alfalfa hay of average quality to make a pound of butterfat in the case of such cows, and a ton of alfalfa will therefore produce somewhere around 60 lbs. of butterfat. Hence, if this is worth 75c a pound, a ton of hay will bring an income of \$45 as marketed through the cow. Under ordinary California conditions the feed is the largest item in the cost of milk production, amounting to at least 50 per cent on the average. Other items, in the order of their importance, are labor, depreciation of cows, bulls and equipment, taxes, insurance and interest on investment; veterinary services and medicines, etc. Fifty per cent of \$45 is \$22.50, so that the contention of some dairymen that they cannot make money on their cows by feeding alfalfa hay worth \$20 a ton is not correct, even if they keep only

cows of a medium production, which no man has any business to do if he can help it, least of all when he has to buy his hay. If he raises his own alfalfa, he receives the difference between the cost of production and the market price on the hay by feeding it on the ranch, so that even if he is not making much money on his cows, he is ahead the profit made on growing the hay.

But an average production of three-fourths of a pound of butterfat per day per cow, or say 200 pounds for the year, is unsatisfactory under modern conditions of dairying; it can be raised by gradually eliminating the low producing cows in the herd that do not yield any net profit for the feed and care bestowed on them, and by feeding the good cows according to their production, giving each about a pound of grain feed for every five pounds of milk produced, in addition to the hay. Additional grain feeding will cause a direct increase in production of from 12 to 20 per cent in case of good dairy cows fed alfalfa only. It will also cause an increased milk flow during the balance of the lactation period after grain is no longer fed, and will put the cows in a

good body condition, which is of advantage both as regards the milk production during the following lactation period and the size and thriftiness of the calves dropped.

By eliminating unprofitable cows, by feeding those retained in the herd some grain, and by grading up the herd through the use of a pure-bred bull of a family of good producers, the dairy farmer will be able to gradually increase the returns from his herd. If this has been improved so that the cows average a pound of butterfat for each day in the year, they will bring in 75c for the amount of hay eaten daily, which will not be far from 30 lbs. With such cows a ton of hay will produce about 67 lbs. of butterfat, worth at present prices \$50.25; one-half of this, or \$25.13 is to be charged to the feed, thus yielding a profit of \$5.13 per ton of hay eaten, if this is worth \$20 a ton. A dairyman keeping good cows will therefore have no occasion to worry about high feed prices. The latter are accompanied by high prices for milk and butterfat, and if he fails to make any money on his cows, it is because he has not done what he can do to improve the herd.

MOTORIZE THE FARM

AFTER doing much of the market hauling of thirty-two farmers around Eden Prairie, Minnesota, with a motor truck on Goodyear Cord Pneumatic Truck Tires, Mr. C. P. Page states: "I would not use solid tires again under any consideration. Hills, mud and storms don't stop the big, tractive Goodyear Cords. Their cushioning is saving truck repairs and depreciation. They also are saving gasoline and oil. I now haul more milk and other loads in less time, find the work far easier, and note that the pneumatics save our roads. Several people have adopted them as a result of my experience with Goodyear Cords."

THE experience described above affords an excellent example of what pneumatic truck tires are accomplishing for farmers. Every limitation hitherto placed on the farm use of motor trucks by solid tires has been removed with the perfected pneumatic tire. For this reason, Goodyear's pioneer work in developing cord pneumatic truck tires has been extremely opportune; it has led to the more extensive use of

farm trucks during a serious scarcity of farm labor. Now, farmers are finding it extremely advantageous to employ Goodyear-Cord-equipped trucks with other time-saving motor units and, thus, to motorize their work quite completely. Special information concerning the use of pneumatic-tired trucks on farms may be obtained from the Goodyear Tire & Rubber Company at Akron, Ohio.

Irrigation Prevented Orange Freezing

(Written for Pacific Rural Press by D. J. Whitney.)

This is a tale with a moral that ran off at a very surprising angle. Cold weather is approaching. Frosts threaten fruits, so I decided to investigate a little and find just how much an orange grower might save by having orchard heaters and a good supply of crude oil ready for any winter freezes.

John Doe and Richard Roe are the names of two friends, each of whom own Valencia groves. Doe did not smudge during some very cold nights and I understood that his fruit had been very badly hit. Roe did smudge and his fruit was saved. That contrast seemed an excellent one. So I went to Doe. "Jack," says I, "gimme the details upon how much money you lost by not smudging last winter."

"Didn't lose a cent," he said. "Dick Roe spent \$4,000 in fuel and labor on his Valencias, to say nothing about expense of equipment, and I got a dollar more a box for my fruit than he did."

Ouch! That was all wrong, so an explanation was demanded. Doe simply took advantage of his irrigating plant and the cold-combatting influence of well water to overcome the frost. (The extra dollar a box was a streak of luck depending upon a break of the market and had no reference to the merits of the fruits.) This is the way he did it.

He had all his orchard furrowed out and ran his pump long enough to get the water all set so that a very small stream would trickle down each furrow without flooding things too much in about 15 hours' run. Then he shut it off and all he had to do was to start the pump in order to get action. Then he watched the weather and the forecast very carefully and whenever a freeze seemed probable he went out about four in the afternoon, started the pump, attended to anything that needed attention, and at bed-time crawled under the blankets and let it freeze if it could. Meanwhile Roe waited for his alarm, and when it rang crawled out from his warm blankets, went out into the chilly night, directed a gang of men, breathed a lot of oil soot, footed a big bill and—saved his crop. Practically everybody who relied on neither water nor oil, but stayed under their blankets and

let it freeze, lost their Valencias, unless they were in a very favorable location, so Roe actually saved a lot of money by his smudging. Also he was on the safe side. His oranges came through untouched. Doe's oranges were on the ragged edge of disaster, for the large majority were hit some, but they were saved just enough by the water to make a recovery into marketable fruit. For a while in spring he was doubtful if he would get anything from them. He just barely got by, but persons in like locations who gave their fruit no protection were absolutely knocked out by it, and the crops on many Valencia orchards went for nothing but low grade fertilizer.

The theory is this in irrigation against frost. Well water in the vicinity is naturally at a temperature of about 72 degrees, winter or summer. It will give off a mist when coming in contact with the cold air. 1. It takes lots of cold to make that mist come from the water. 2. It takes lots of cold to lower the temperature of both mist and other water down to freezing temperature. 3. An immense amount of cold is used up to make that water turn to ice (or frost), and it is difficult for the air above that water to get much colder than the water. Since it takes several degrees below freezing to affect an orange, small trickles of water all through an orchard provide a great protection. It would not, it must be understood, protect against a very serious freeze, particularly when the air is moving. However, smudging also is difficult then.

Doubtless, having the ground well supplied with moisture enabled the tree to build up touched fruits quicker than they would recover where the ground was dry. The system unfortunately cannot be operated successfully in connection with smudging, as wet ground would prevent the travel necessary in filling and lighting the pots.

For those who intend to try this plan of frost protection, Roe particularly emphasizes the necessity of starting the water before dark when frost threatens. If a person waits till the frost comes, he will wait too long.

Prune Tree Fifty Years Old

(Written for Pacific Rural Press by Leon Thomas, Gilroy.)

The question has been asked very often by those who are about to purchase a prune orchard and who are not familiar with prune growing, how long will a prune tree bear or how long will a prune orchard live? The writer has always answered these questions by saying: A prune tree will live indefinitely with good care. I contend that the life of a fruit tree is longer than the life of man. I am basing my judgment on a prune tree on my father's ranch which is 50 years old.

A hard-shelled almond was planted fifty years ago by my uncle, C. R. Thomas, now a fruit grower of this section. When the tree was several years old it was grafted about 5 feet from the ground. At that time they did not know what a French prune

was, but called it a poor man's plum. The reason for this was on account of the fruit being so sweet.

This old (poor man's plum) tree today is 5 feet in circumference one foot from the ground. It is very close to 30 feet high—bears regularly and never has been bothered with borers. Last year it produced 400 pounds of green prunes, which were picked by myself and family. The tree is in perfect health and was so heavily loaded that two limbs broke from it.

This story is not intended to boost our ranch as it is not for sale, nor is it a bragging contest, but merely to enlighten those who are anxious to know that their orchard will not die shortly after they purchase it, provided they give the trees the chance they are entitled to.

Gophers Killing Plum Trees

According to W. C. Jacobsen, Superintendent of Rodent Control of the State Department of Agriculture, a large acreage of alfalfa and a great many fruit trees in some of the Reclamation districts in northern Yolo county have suffered seriously from the depredations of pocket gophers. Grain lands have been literally honeycombed by the surface burrows of this pest, and since the grain has been removed and the stubble burned the gophers are making severe inroads into alfalfa fields and young orchards. On 300 acres of plum trees over 200 young trees could be readily lifted out of the ground, the tap roots having been cut off within a few inches of the

surface. An alfalfa field which has had a good stand for the past two years has been so invaded as to have only one-third of the crop as was the case before the invasion of this rodent pest. Methods and means of control are quite difficult because of the nature of the soil. However, arrangements have been made to flood a large area and drown as many as possible before proceeding with poisoning and trapping. County Horticultural Commissioner Gould, of Yolo County, in company with Mr. Jacobsen, made the tour of inspection and reports that his commission will lend every effort and assistance to the land owners in the vicinity of this gopher outbreak.

Our Message to you:

Spray now for healthier trees—stimulated growth—better fruit—more of it, and better prices.

Our Advice to you:

Do it with a
BEAN POWER SPRAYER

Three new power sprayers are placed in our line this year. We call them Simplicity Sprayers. They are compact, efficient machines—the most simple and most easily operated machines ever built. May we send you a description of these outfits? Use the coupon.

Sprays for Prunes and Peaches

To the Editor: Is it necessary to spray French prune trees; and if so, when and with what? My prune trees dropped their leaves early in the fall and later in the fall sprouted again and some of them blossomed. Some of the trees in spring get leaves but make no great growth. They stay small all summer and their edges become brown. Which spray is best on a peach tree in fall and spring? Is bluestone and lime all right, and if so, which is the best mixture?—P. K. G., Dinuba.

It is our opinion that no spray will help the trouble which you mention. The chances are that the trees do not have enough water through the summer. People frequently think they are irrigating heavily, but when they dig down after an irrigation they find that the water has not penetrated very deep. The reason your trees sprouted this fall was the rain we had, as near as we can guess.

Occasionally the shot-hole fungus works on prune trees, deadening the buds so that they either do not come out in the spring at all, or make very

narrow, sickly leaves. Generally such buds can be easily pulled off, and you can see a stringy, syrupy substance as you pull them off. The spray for this disease is Bordeaux Mixture (bluestone 5 lbs., lime 5 lbs., and water 50 gallons). Dissolve the bluestone by putting it in a bag and hanging it just under the surface of a barrel of water containing 25 gallons. Slake quicklime separately, and mix these solutions in equal quantities whenever you are ready to spray. For the shot-hole fungus your first spray should have been applied not later than November, but since we have had no rains, the chances are that you will still be in time.

If the fruit trees have scales or moss, the best spray will be commercial crude oil emulsion, applied as soon as you get the trees pruned, the sooner the better. On peach trees shot-hole fungus is called peach blight, and it requires the same treatment mentioned for prunes. In both cases a spray of commercial lime sulphur should be applied in the spring just as the buds are breaking.

Do Not Pick Green-Colored Oranges

To the Editor: I am very much interested in the excellent article in Pacific Rural Press, November 8, on orange maturity test; but am sorry for one statement you have made there, as it is liable to lead some growers astray. There is a great deal of valuable information in this article, but the statement under the heading, "Mature Poorly After Picking," near the bottom of the second column is a mistake, and any grower who follows the procedure outlined there will surely come to grief. You state "the orange-grower who picks too green merely has his fruit shoved to one side until it gets ripe enough to qualify for packing. This it will do with some delay. Both color and sugar will develop when the fruit is off the trees and it will become a valuable product." This is positively contrary

to the law. You will note by referring to Section 9 of the amended orange law, that the oranges must have attained at least 25 per cent yellow, or orange color, before picking. It is not necessary that they test 8 to 1 at the time of picking, but must reach this test before packing, but if picked before the 25 per cent color is attained, they are a dead loss and must be destroyed.

They may be picked and shipped upon attaining a 70 per cent color, regardless of the test so far as the fresh fruit law is concerned, but the exchange will not allow fruit which does not show an 8 to 1 test, regardless of color, to be shipped as Sunkist.—Chas. F. Collins, Tulare County Horticultural Commissioner.

The statement referred to was meant to apply strictly to the sugar

test, though it does not seem to. Under the heading, "When to Pick," it will be seen that picking, even for a test, was to be delayed until sufficient color had developed, then if a person was fooled about ripeness in relation to the sugar test he would still have valuable fruit. Color is a thing that can be known while the fruit is on

the tree. The sugar test is determined after the fruit is off. Mr. Collins' statement makes very plain the important fact that picking of fruit too green in color will not be permitted, but that picking fruit too "green" in interior development can be permitted, if shipment is delayed until ripeness develops.—D. J. W.

Grading Walnuts

To the Editor: How are walnuts graded? What is meant in the quoted prices by the term "budded"? Why do not the Franquettes appear in the quoted prices?—J. H. Y., Meridian.

Walnuts, as commercially shipped, are graded through a screen with square holes, measuring one and one-thirty-second inches square. The so-called No. 1, sold by the California Walnut Growers' Association, are the nuts which do not pass through this screen, and the No. 2's are those which pass through. Budded varieties are graded through a similar screen with holes measuring one and three-sixteenth inches square. The Diamond Brand Buds do not pass through, and the Golden State Buds are those which fall through.

Practically the entire planting of walnuts in California in recent years has been one of several budded varieties. These varieties are the Pla-

centia Perfection, the Eureka, Franquettes, Earhardt, Mayettes, and several others, which are grafted or budded onto black walnut roots in order to secure a more uniform production than is possible on planting seedlings. Practically all of the Franquettes producing nuts of commercial value are grafted upon black walnut roots.

This variety is in many cases sold on sample because the quality varies so widely when produced in different sections of the State, under varying climatic and soil conditions. There is not a heavy enough production of this variety as yet to warrant handling on a regular commercial basis, as the trade in many parts of the country is not familiar with it. However, the price on Franquettes, if of good size and containing light-colored, plump meats, is as high as any of the other varieties produced today.

"It Clears the Land"

"Bill sold me this place cheap—he couldn't make it pay. Labor was scarce, and the job of clearing out this old orchard without five men to help looked too big for him.

"He didn't know what a cinch it would be to blast the old trees out with dynamite. Looks like a two years' job by the old methods but no more cutting and stump grubbing for me!

"I'll blast them out, roots and all, with

HERCULES DYNAMITE

"We use dynamite for all sorts of work on our place—planting trees, digging ditches, and post holes, clearing land, cultivating between the rows of our bearing orchards and doing a hundred other things. Never knew there were so many ways to save labor on heavy farm or orchard work until I sent to the Hercules Powder Co. for a copy of their 68 page book, 'Progressive Cultivation'."

Better send for this book—you can get it for the asking. It'll help you to improve both your farm and your bank account. Sign the coupon and mail it today!

California Bee Buzzings

UTAH BEES ENDANGER CALIFORNIA.

The shipments of bees has commenced to arrive from other states, a carload of 600 having recently arrived from Utah, in the Corona district. It takes a great deal of effort for the beekeepers of the State to extend a glad hand to these shippers at a time like this when there has been practically no honey flow since June, the bees having become weak and so badly in need of feed that disease spreads through them like wildfire. It is almost impossible to say that anyone in the State has an apiary of bees entirely free from disease, and the time has come when it is absolutely impossible to clean up all disease in an apiary and keep it clean when there are apiaries with more or less disease all around you.

It is possible for any man to clean up his apiary so that the best bee-inspector in the State could not find a trace of foul brood, but this does not mean that there is no source of further contagion nearby.

There are hundreds of apiaries in this State that are reported free of disease by inspectors, that if left alone and without any other source of contagion for a year would show signs of disease in 50 per cent of the colonies. What protection has a beekeeper who is trying to keep his apiary free of disease when the law allows an outside bee keeper from another State to bring in his bees and place them right down beside him. Apparently the newcomer's bees may be clean but all practical beekeepers know that an apiary can be cleaned up for inspection.

Beekeepers owe a great deal to the efforts of our county bee-inspectors, but none knows better than they how futile his efforts are when apiaries are a half and a quarter mile apart.

The California beekeepers realize this and do not attempt to overstock a range, but keep their apiaries at least a couple of miles apart and further, according to the range. They know they cannot exist in the State without this protection. The wandering beekeepers do not intend to remain. They merely wish the cream of the early honey flow to build up their bees and they are then off to another State to obtain the honey flow there which they can gather because they were able to strengthen and increase their bees from the orange blossom honey flow in California. They do not care how crowded the range is in California, for it is not important for them to make a large surplus of honey here for that can be gathered in another State. It is absolutely essential, however, for the local beekeeper, as his very livelihood depends upon it. The honey industry in California means over a million dollars a year to the State, so it is time now for the State to take up this problem while the bee industry is still struggling for existence. — C. G. Standeford, Los Angeles.

PREPARING BEES FOR WINTER.

"Anything worth doing at all is worth doing well" may be particularly applied to the bee industry. The perfect colony goes into winter free from disease, with a strong, vigorous queen, ample stores, strong in young bees, a contracted entrance, and no super room, if possible. This will assure you a minimum of winter loss and a colony that will attain results.

A weak, starving colony, to the commercial apiarist, does not justify feeding. Two or three such colonies, however, may be united upon a well-fed colony of 25 to 60 lbs. of winter stores, depending upon the locality. One good, vigorous colony is worth three mediocre ones during a honey flow, and that is more than you may expect if you carry three weak colonies through winter on what you should have given one. So select your best queens, feed them well, kill the

queens in the others, transfer them to supers and set them over your selected ones with one thickness of newspaper between. Three days later you may shake the bees out of the super combs and remove them. All brood should have been removed from the upper colonies and inserted in the brood nest before uniting.

All feed that has been scorched will kill any colony to which it is fed through dysentery. Thin syrup and out-door feeding both excite brood rearing, which is too expensive to even consider at this time, but especially desirable for spring manipulation.

From each colony remove the combs you expect to fill with syrup and stack them tightly in the house away from robbers. Using a can with a row of fine holes punched from the inside out, fill your combs on both sides over a tub of thick syrup, hang in supers, and feed in the evening to prevent wholesale robbing. Feed what you will at one feeding and you will attain better results with considerable less consumption. Sulphur all dry combs and stack them away from mice, watching them once a month for moth. — G. C. Carpenter.

IMPERIAL VALLEY BEEKEEPERS MEET.

The Annual Meeting of the Imperial Valley Honey Producers' Co-operative Exchange was held in El Centro, on Monday, November 5. Charles B. Justice, General Manager of the California Honey Producers' Co-operative Exchange, gave an address which covered all angles of the business for the past year. He freely stated where mistakes had been made as well as successes. His talk was straight from the shoulder and made so much clear that the workings of the Exchange received many words of praise. Every member present expressed himself as being perfectly satisfied with the first year's work. All agreed to stand up and be stronger for the Exchange the coming year.

The members brought their wives and families with them, so that a delightful picnic luncheon was had in the Park. Each family had provided a big basket of good things to eat. Surely this meeting will lead to many gatherings of the members and their families as well as to a closer friendship and mutual good will.

The following directors and officers were elected: Wm. Gunterman, President; Wm. Moores, Vice-President; C. P. Dandy, Secretary-Manager; W. J. Hill and Wm. Hilderbrandt, Directors. Our members are a strong lot for co-operation and this Local Exchange will be one of the strong links in the California Honey Producers' Co-operative Exchange in the future. — C. P. Dandy, El Centro.

HORTICULTURAL JOTTINGS.

Watsonville district ships 1955 cars of apples to date, with prospect of 1000 more.

On September 26, 8,771 boxes of apples were exported from New York to South America.

Emperor grape shipping will be finished by the time this note appears. An early frost hit the grapes.

A Watsonville apple packer is in trouble for packing inferior apples under the "California Fancy" label.

Sacramento and Butte counties are both reported to have shipped the first carload of oranges east this year—November 7.

Production of Spanish Almeria grapes, which compete with our Emperors, is estimated not to exceed 44,000,000 pounds as against a normal crop over 52,000,000 pounds.

The charge of injurious price setting preferred against the California Associated Raisin Co. is to be argued in Washington November 20. President Wylie M. Giffen, A. E. Sunderland, and F. H. Wilson have gone to testify.

The **CHEMIST** says—
"genuine **GIANT** is
always uniform"

At every Giant Powder plant the chemical laboratory controls the processes of manufacture. They make continuous tests that insure the unvarying high quality of Giant Powders. Each pound of Giant Powder is exactly like every other pound of the same grade. Such uniformity means economy, efficiency, safety. Professional users of Giant Powders—miners, quarrymen, contractors—all know that the name "Giant" stands for utmost dependability in explosives. When you have land to clear, trees to plant, subsoil to be broken or ditches to be blasted, tell your dealer to get for you one of the Giant Farm Powders—Eureka Stumping or Giant Stumping. Don't accept any ordinary dynamite, but insist on genuine Giant Powder, bearing the Giant trade mark on every box.

A postal will bring you our book, "Better Farming with Giant Farm Powders." Its 52 pages are full of short-cuts and labor-saving methods.

AVOCADOS IN THE SAN JOAQUIN.

(Written for Pacific Rural Press.)

As a tropical fruit, originating in a moist, warm climate, it seems questionable how profitable, horticulturally and commercially, avocados will be in the hot, dry climate of interior California. Their popularity in Southern California is rivaled north of the Tehachapi by only an occasional garden tree and a very few small commercial plantings. One of the best of these is on the ranch of C. Ed. Meyers, several miles above Lemon Cove, in the foothills of Tulare county, in a section admirable for citrus and other tender fruits wherever the ground is level enough for orchards.

His trees are all Harmons, with the exception of one Ganter and four or five other varieties, which are of too recent planting to prove their merits. The older trees were set out five years ago last April and have flourished exceedingly, averaging approximately 25 feet from the ground and having a very large spread. The Ganter has had more water than the others and it is thought for that cause has set more fruit. It had more than 150 fruits in 1918 and something over 200 this year, though this season no accurate count was kept. Consequently the combination of fine growth and early bearing, since a good crop the fourth year is surprising, makes Mr. Meyers feel very optimistic. All of the crop is arranged for by a San Francisco physician for diabetes patients.

Avocados for Diabetes.

It is claimed that this fruit is excellent for that disease. A visitor once wanted to purchase some fruit, but none was ripe, so he secured a lot of leaves, explaining that tea made from them was prescribed when fruit was unavailable.

In this section these two varieties are safe from frost injury to the fruit, the bloom coming when spring frosts are about over, and the Harmons being harvested in September and the Ganters in October. Mr. Meyers states that the bloom is exceedingly heavy and apparently abundant irrigation is needed to make them stick. On the other hand, some dooryard trees on a Lemon Cove ranch, several years older and a third of the size of the Meyer trees, apparently from scanty irrigation, seem to set fruit quite well. Frequent irrigation seems to be needed to make growth, as is indicated by a number of dooryard trees in the valley.

Highly Ornamental.

Avocados can be highly commended for a garden at least. Their beautiful appearance and large growth commends them for shade trees by one's house.

The success of the seedling tree at Visalia, referred to in the Rural Press recently, and the serious injury of other trees in a supposedly frostless location in Fresno county, indicates that frost resistance is largely a matter of variety.

POLLENIZER FOR IXL ALMONDS.

To the Editor: Kindly advise me as to what is the best pollenizer for the IXL almond. My orchard is planted to Texas, IXL, Drake, and Nonpareil in rotation. The IXL is a shy bearer and I am told that I should graft in with either the Ne Plus Ultra or the Peerless. Which one would you prefer and would every fifth tree in a row be sufficient?—C. J., Arbuckle.

Ne Plus Ultra should furnish proper pollen for IXL; and it is next highest in market value. If you graft into the tops of your IXL's you will have some difficulty separating varieties. That might serve as an emergency measure to get pollenizing blossoms quickly; but you will probably find more permanent satisfaction in filling empty spaces with Ne Plus or working over an occasional entire tree. A good sized branch in every fifth tree should do the work, but it will be done better if you can have a few stands of bees among the trees. Don't depend on neighbor's bees unless they are close and plentiful.

Our Corn Better than Eastern

(Written for Pacific Rural Press by G. R. McLeod of the Sperry Flour Co.)

Field corn raised in California this year will probably total in the neighborhood of 50,000 tons.

We figure that there is approximately 35,000 acres planted in different parts of the State and that the yield will be considerably over a ton to the acre.

Consumption of corn in California is based largely on the price in comparison with other feeds.

The 1918 crop is estimated at about 35,000 tons and the largest part of

how much, as most of the Eastern corn went into the Los Angeles markets. Most of the corn brought in originated in Kansas, Nebraska and the eastern portion of Colorado.

From a milling point of view California corn is better than Eastern corn. The variety of corn that has produced the best crops here is a cross between a Flint and a Dent. The milling yield on this variety is excellent, the color is good and the flavor equal to any Eastern-corn ob-

California Indian corn has increased rapidly in popularity as a money crop. When properly cured it is preferred by the millers. It cures better when bound and shocked as is shown in the upper picture than when it is left standing as it grew. The lower picture is a characteristic scene on the levee in San Joaquin county. The cribs have just been emptied through a tractor-operated corn sheller, leaving great piles of cobs.

this was consumed at home. In addition to this there was considerable corn shipped in from the Eastern States. It is hard to estimate just

tainable. We believe it is a matter of variety rather than climate.

Most of the corn arriving from the East is of the Dent variety and carries a heavier percentage of germ and bran than the local corn. The only difference between the California and Eastern corn, in a laboratory test, is the higher percentage of fat in the Eastern corn. This would probably be desirable if the corn was handled by people who manufacture corn oil, corn sugar, etc., but it would not be desirable from a milling standpoint either for corn meal or hominy.

Moisture Content Important.

Laboratory examination of corn consists principally in determination of its moisture content. However, other factors enter into the valuation of corn which may be considered in this writing.

California corn contains all the way from 10 to 30 per cent moisture, depending upon seasonal conditions and time of harvesting, condition of storage and time of storage.

We recently tested some corn purchased at Stockton which had 10 per cent moisture. It is doubtful whether any Eastern corn ever gets as low as 10 per cent. As a matter of fact, a majority of the Eastern corn has about 16 per cent moisture. At the present time we are able to purchase considerable corn with less than 15 per cent moisture raised around Stockton.

This moisture content is quite an important factor, as upon it depends the keeping quality of the corn. If the moisture is too high, it will heat and spoil in storage. However, we have by use of the corn driers been able to reduce the moisture content to 13 or 14 per cent, at which figure corn will keep indefinitely.

More and Better Corn Meal.

Perhaps the most valuable characteristic of California corn is its phys-

CITRUS GROWING IN CALIFORNIA

A 5/16 of an acre plot of
Orange Trees at Corona,
fertilized with

NITRATE OF SODA
and acid phosphate at 320 lbs.
of each per acre, yielded at the
rate of 411 boxes of high quality
fruit. A plot alongside, fertilized
without Nitrate, gave a rate of
yield of only 322 boxes per
acre of inferior fruit. This difference
of rate of yield of 89
boxes per acre shows an increase
in value of produce
equivalent to \$324.85.

100 lbs. of Nitrate of Soda in this
case added a rate of profit to the
grower's income of \$101.52 per acre.

HORTICULTURAL JOTTINGS.

The Nova Scotia apple crop is about 2,000,000 bushels this year.

Tulare orange shipments began about the middle of November.

A leave of absence has been granted F. T. Bioletti, Professor of Viticulture at the State University, to take effect June 30, 1919.

Gilroy has again lived up to her reputation for producing big prunes by grading out nearly half of her crop of 60's or larger.

The Sylmar olive orchard of the San Fernando Valley is the largest in the world, and this year has the largest crop in its history.

Orange picking is progressing rapidly in the Tulare district. The crop of Washington navels is turning out better than anticipated early in the season.

The Fresno Chamber of Commerce, besides maintaining exhibits in San Francisco, and Los Angeles, plans for the installation of a dried fruit exhibit in New York City.

Southern California's walnut crop this season will total 50,000,000 pounds, and is valued at more than \$15,000,000, according to the estimate of the secretary of the California Walnut Growers' Association.

Frank Gehring, secretary of the Tulare Board of Trade, has been notified by the National Orange Show of San Bernardino, that he has been appointed one of the judges in the show to be staged there next February.

The United States Government, through the U. S. reclamation service, will sell 6,000 acres of what is claimed to be frostless citrus fruit lands at Yuma, Arizona, on December 10.

More new members had joined the California Prune and Apricot Growers, Inc., in the three months preceding their present drive than in any other three months since the Association was organized, according to Dr. F. M. Coleman.

Horticultural Commissioner Alley reports the squirrel extermination campaign now on in San Luis Obispo County as very successful. Many ranges will support double the number of stock when the rodents are killed.

The Standard Chemical Co. of Emeryville Station, Oakland, has changed its name to the "East Bay Chemical Co.," with headquarters and factory at the same location. They manufacture the same assortment of spray materials as heretofore.

Lodi growers received more than \$9,000,000 for the grape crop of 1919. This includes Tokays and all other varieties of table grapes, wine grapes and strippings shipped East up to and including November 8, and the wine grapes and strippings crushed by local wineries.

The question of lifting the embargo on the importation of apples into Australia has been carefully considered by that Government, but in view of the large stocks held at present in Aus-

tralia, it has been decided not to permit importations of apples this year.

The California Prune and Apricot Growers' Association, through its secretary, have purchased a site at Visalia for the erection of a prune packing plant at an initial cost of \$75,000.

Tulare County has added in the past year 1800 acres to her prune area.

Reports from Butte County state that the orange crop this season will exceed that of last year by a considerable margin. The crop appears materially heavier where a cover crop was grown, or where weeds and grass were allowed to remain unmolested after the spring plowing.

More than 2,000 orange trees on the Drescher ranch near Oroville have been girdled by field mice and will die, County Horticultural Commissioner Earl Mills said recently. This establishes a record in northern California for the ravages of these rodents.

A "baby lemon," cross between a lemon and a grapefruit and twenty-two inches in circumference, is now on display at the Fresno County Chamber of Commerce. The fruit weighs between three and four pounds, and is said to combine the best qualities of both fruits and to have a distinctive flavor.

Monterey County is to be the location of a new 1500-acre fruit orchard. Near Kings City the land acquired by Ventura capitalists has been placed under irrigation and beans produced, preparatory to getting the ground in shape for a great orchard enterprise. We learn that a stock company has raised money largely in the east to finance the proposition.

M. A. Rex of the Bureau of Chemistry, United States Department of Agriculture, is now stationed in Lindsay for the continuation of experiments which the government is conducting in connection with orange maturity standards. These experiments, which have been in progress for a number of years, have produced much valuable information for the growers. One result of these experiments is the 8-to-1 standard of maturity.

A phenomenal yield of pears from his six-year-old trees was obtained again this year by W. A. Caldwell of Camino, El Dorado County. The yield is attributed by Caldwell to the pruning system used. From 710 Bartlett pear trees a yield of 2,100 boxes is reported, while 364 boxes of Winter Nelis pears were secured from 95 trees. One tree produced nine boxes of Winter Nelis pears, while the prize Bartlett yield from one tree was a little over eight boxes.

In fining a Japanese, F. Fukui, \$25.00 for selling apples that did not conform to the State Standardization Law, Judge Thos. R. Dougherty delivered the following timely advice to the culprit: "A second offense will mean heavy punishment!" The honorable courts of Alameda and San Diego already have adopted what promises to be a potent weapon in cases of flagrant violation of the standardization law, and when "repeaters" are haled to the bar of justice, the fines imposed in preceding cases are "doubled."

Apple production in eastern superior California has reached the greatest degree of efficiency in history this season, particularly in the mountain sections. Men who are representing the producers in the shipment of the fruit report that the increase in apple prices in 1918, coupled with the strong demand for the product, led the growers in mountain sections to cultivate apple orchards, and to prune and spray them thoroughly for the first time in many years, which has resulted in very heavy shipments this year, and the growers are so well satisfied with the increased production brought about by the care of last year, that cultivation, pruning and spraying are to be done even more thoroughly in preparation for next season. Orchards which were practically abandoned are netting good profits as a result of care.

CALIFORNIA

Hog Book

A Practical Treatise on Hog Raising in California

By W. S. Guilford

Director of Agriculture, Sacramento Valley Irrigation Company and Practical Swine Breeder

First Edition—1916

256 pages of text; 31 pages half-tone engravings besides line cuts. Cloth bound.

The author has had large personal experience in hog breeding, besides the opportunity of observing many plants in this and other States. He has brought together a wealth of practical and scientific information concerning the hog, its anatomy, the breeding, feeding, marketing, as well as diseases and remedies.

California Bean Growers' Association

The California Bean Growers' Association was organized in February, 1918, under the laws of the State of California:

"To promote, foster and encourage the business of raising any and all varieties of beans; to aid in the marketing and distribution of beans, grown by its members."

It is a non-stock, non-profit organization, its expenses being met by a small charge per ton on each year's crop as grown by the members, who, under their crop agreement, which constitutes a membership, are required to turn over to be handled by the Association through its selling departments.

Its Directors are:

Northern Division.

J. V. Mendenhall, San Francisco; S. E. Meister, Sacramento; Fred W. Kiessel, Sacramento; Peter Cook, Rio Vista; Cline Bull, Marysville; J. W. Halpin, Atwater; Dal Smith, Meridian; Lincoln White, Sacramento; Emery Oliver, Sacramento; J. H. Glide, Sacramento; R. L. Morehead, Sutter City; R. H. Fraser, Modesto; W. K. Brown, Colusa; I. L. Borden, San Francisco; J. M. Bigger, Stockton.

Southern Division.

C. K. Hardenbrook, Salinas; N. D. Hall, Lompoc; H. R. Nicholson, Santa Maria; W. H. Cooper, Lompoc; C. L. Presker, Santa Maria, Antone Souza, Guadalupe.

The Association, which is now nearly two years old, is steadily increasing in membership and at the present time has nearly 1700 members. Since its organization it has handled approximately 1,500,000 bags of beans of every variety, except Limas, grown in California, and is now marketing one-half of the bean crop of the State.

During 1918, at the request of the government, the bean growers of California planted a much larger acreage than usual. This resulted in an abnormal crop, and with the sudden termination of the war, and the early rains, caused considerable damage, leaving the bean market in a very unsettled condition. This resulted in an unusual "carry-over" from the 1918 crop of choice beans of all varieties. These, however, are now being marketed at satisfactory prices. Figures thus far obtained would indicate that the production of beans by members of the Association, and which will be handled by it, will amount to between 700,000 and 800,000 bags, while the entire yield of all growers in the State shows that the 1919 crop will run about 60 per cent of the normal yield.

The Association has accomplished much in the economical and profitable

handling of the bean crop of the State and toward reducing the ultimate cost to the consumer, through the elimination of the speculator and unnecessary selling and marketing agencies. This has been brought about by excellent connections in the large eastern centers of distribution, and the legitimate buyers are beginning to look to the Association for its stocks.

Working for a Protective Tariff.

Through the efforts of the California Bean Growers' Association the question of a protective tariff on Asiatic beans has been brought before the Ways and Means Committee of Congress, at Washington, D. C., and the indications are that it will be reported out with favorable recommendations. The Association has been given the support of the various bean-growing interests of other States and the committee is now in Washington watching the outcome of its efforts.

That the association method of handling crops is the only satisfactory, economical and profitable one for the grower has been proved beyond question. Today the majority of the citrus, walnut, almond, vegetable and other farm and orchard products are marketed by associations whose growth, through right methods, has been remarkable, as well as profitable to their members. While the California Bean Growers' Association is one of the youngest of the associations it is already showing a vigorous growth and will soon take its rightful place, representing the second largest crop produced in the State of California and approximately 50 per cent of the beans grown in the United States.

One of the outstanding benefits to the members is the fact that through financial arrangements, he does not have to wait until his crop is sold at any price that may be offered by the speculator, but immediately upon threshing and placing in the warehouse an advance of 50 per cent at not to exceed 6 per cent interest charges is made by the Association at the average market price. According to statement of the Federal Reserve Banks the average agricultural loan interest is 8 per cent. With the association method "red tape" is eliminated which is not true of the usual loan on crops and the grower gets prompt action and financial assistance when he most needs it.

Those bean growers who are not members of the Association will do well to look into the California Bean Growers' Association and participate in its benefits.—California Bean Growers' Journal.

Baart Not for Alfalfa Land

To the Editor: I have land that was in alfalfa for several years, but the last two years have grown barley and followed it with beans. Barley made 20 to 32 sacks per acre. Do you think I can make more out of wheat, and how much per acre should I drill on well prepared land. Does Baart wheat ripen as early as barley?—J. M. A., Marysville.

The only place we have found in this state where Baart wheat has been tried and found wanting was a community where the soil is rich and deep and well supplied with moisture. The criticism was that it went to straw and failed to make as much

grain as Little Club, presumably from an excess of nitrogen in the soil. For this reason we hesitate to recommend Baart for your location where the soil is well supplied with nitrogen from alfalfa and beans. It ripens practically as early as barley. Where wheat makes a fair crop we believe it will make more money than barley. Eighty pounds of Baart seed per acre, or 90 pounds for other varieties.

The exportable surpluses of Algerian wheat and barley are to be purchased for the French army at \$3.15 per bushel for wheat at the dock and \$1.77 for barley.

SPERRY WHEAT YIELDS TWICE AS MUCH AS CLUB.

When W. D. Cardwell put in his grain for the present year he procured a quantity of Sperry No. 1 (Bunyip) for a try-out. It was well recommended and he bought enough seed for fifty acres. He had that sowed in the center of 800 acres, the 750 acres remaining being seeded with what Mr. Cardwell designates as Club wheat. None of it is irrigated land, and all was prepared alike. As he had planted the Sperry No. 1 as an experiment and for comparison, he took great care to check up the results.

When the wheat was harvested Mr. Cardwell found that the fifty acres produced 459 sacks, average weight 143 lbs. per sack of wheat that weighed 61½ lbs. to the bushel.

The yield per acre was almost exactly double that harvested from the remainder of the 800 acres, and Mr. Cardwell was so well pleased that he intends to keep all of the Sperry wheat for seed.

Bomberger's Tested Alfalfa Seed

Why buy common alfalfa seed when you can get seed particularly adapted to Pacific Coast conditions, carefully tested in the field while growing, thoroughly re-cleaned after threshing, carefully analyzed to make sure that it is free from noxious weeds, and tested to prove strong germination?

We sell that kind.

MORE THAN 1500 GROWERS OF
ALFALFA AND CORN IN CALIFORNIA
HAVE SIGNED A DECLARATION OF INDEPENDENCE

A state-wide, co-operative, non-profit association is the result,—it is known as

ALFALFA GROWERS of CALIFORNIA, INC.

and it applies modern marketing methods to the sale of alfalfa and corn products of its members. It renders an intelligent service in distribution and sale,—and at-cost service. All members are actual producers; all the product of every member is sold by and through the Association.

The value of membership is great—the cost is trifling. If you are a producer it is your privilege to become a member. More than 50,000 acres represented by members, assuring economy, efficiency, and stability in distribution and sale. Sign the Declaration.

Kern County for Cotton.

A plant of Egyptian cotton containing 100 mature balls grown in Kern County this season has been on exhibit in one of the San Francisco banks for some time. It came from a field of 22 acres planted by W. E. Vaughan on June 9 and following days. It has not yet been picked, but the yield is estimated over a bale per acre. Last year 5,100 pounds of seed cotton from three acres of Egyptian planted May 10 yielded 1,700 pounds of lint, a gratifying percentage. This was left on the stalks until February. Much of it opened in January when the reservoir froze over. Frost seems needed to make leaves drop and bolls open. This cotton was sold in March at 46 cents per pound.

The 1919 crop was grown on black land, flooded before planting and irrigated by flooding after it was up. The best plants were in two rows alongside a rice field. Seepage kept the soil muddy on these two rows through the cultivation period. Mr. Vaughan was told to thin the plants to 20 inches apart. This he did. When they were two feet tall he tried to thin some of them to 40 inches apart. That is where he got the most bolls per plant.

Egyptian bolls have proved too sharp for pickers fingers, consequently Durango cotton will be grown next year on 640 acres if that much can be prepared in time.

Potatoes for Tule Land.

To the Editor: I am working up some raw tule land this fall. The soil is a perfect mat of roots filled with a light adobe sediment that is very rich and easily subirrigated. I want to plant potatoes. What is your opinion as to whether early or late planting will be in most demand next year? What variety of early potatoes would you suggest for my conditions? How could I get in touch with someone who could sell me seed selected in the fall for production and quality?—C. T., Rio Vista.

You are to be congratulated in your resolve to use field selected seed. Communicate with W. V. Shear, State Department of Agriculture. His work is largely field inspection of potatoes grown for seed. British Queen and Early Rose are the commonest early varieties. Owing to the considerably short potato crop this year throughout the United States, we would expect early potatoes to be in greater demand than usual next season.

Peas and Lentils in Salinas Valley.

About 5,500 sacks of commercial peas, averaging 115 pounds per sack, were stored this season in the Mitchell-Silliman warehouse at Salinas; and about 3,000 sacks were stored at Castroville. About 1,400 sacks of seed peas, mostly grown for California seedsmen to ship East, were also grown in the valley and stored here. Most of the lentils used in the United States come from Chili, but the lower Salinas Valley this year produced and stored over 600 sacks. These are considered of better quality than imports from Chili.

Keep Seed Wheat Clean.

The milling quality of much wheat in the Middle West is seriously reduced by the presence of certain inseparable weed seeds, which injure the color, odor, and taste of flour made from it. Early Bart wheat, so widely introduced in California last year, was carefully re-cleaned at the mills. This year most farmers will plant their own seed or buy from neighbors. It is most important that this seed be thoroughly re-cleaned before planting each year. Otherwise it will "run out."

Let's Raise More Egyptian Cotton.

Egypt exported 537,507,615 pounds of cotton of the 1918-19 crop and on September 1 had 43,878,885 pounds on hand. England took more than half of the exports, but U. S. took 71,284,153 pounds. Looks like some room for increase of Egyptian cotton in California and Arizona.

Alfalfa Seed 600 Pounds per Acre.

Alfalfa yielded about 600 pounds of seed per acre for L. V. Richardson of

Killefer
Quality

Combination SUBSOILER and FERTILIZER PLOW

Killefer
Efficiency

PUT MANURE INTO THE GROUND WHERE IT WILL DO THE MOST GOOD.

Our Subsoiler is easily made into a Furrow Plow by changing standards.

The Furrow Plow is handled from the seat of the tractor and is strong enough to go into any ground and make a good furrow.

Subsoil your orchard first. Break your soil so the water can get down into it, then attach the plow standard to the subsoiler frame and open up a furrow. Then put the manure into the ground.

This is the method employed by some of the most successful growers.

Farm Owners' and Operators' Association

From the report of J. J. McDonald, chairman of the Santa Clara Unit of the Farm Owners' and Operators' National Association, we take the following: "Every member of the organization should feel proud of the work accomplished wherever a unit has been organized, for reports from the various counties spell service to the best interests of the grower. Every member should consider himself a committee of one to advance the organization, both in efficiency and membership. The retiring trustees did good work this year, but they could not have accomplished the good they did without loyal support from individual members, and the newly elected trustees will need the loyal support and enthusiasm of every member.

"One of the means used by our unit to serve its members is the farm labor bureau, with headquarters in the Chamber of Commerce rooms. Since July 22 of this year this bureau has sent out 1046 workers in response to requests for help to harvest the crops. No record was kept of the number of workers sent out during the five weeks of the telephone strike. It is safe to estimate the number at not less than 500. The bureau has exercised its right as a private bureau to discriminate against disturbers and other undesirable applicants for work.

If at any time an unsatisfactory worker is supplied, the bureau would be glad to have such case reported, as it is not always possible to judge a worker until he is tried out. Many of the workers have expressed their appreciation of the bureau and they have good words for the orchardists.

Your chairman has talked with several of the cannery people, and also packers, having in view the matter of establishing conjointly with them a labor bureau for next year on a larger and better scale. We realize that it is just as important that the canneries be supplied with the very best held as it the rancher. This is a very important matter that will be awaiting the action of the new board of trustees and their chairman.

Housing for Harvest Workers.

Another means of assistance which our unit expects to put into operation next year is the establishment of properly supervised community accommodations for housing and feeding our young people who are eager to help harvest the crops. The plan was tried in some districts this season in a limited way and was found to be a feasible plan. It is cheaper and better in every way than the old practice where each grower provided accommodations, or, failing to provide suitable sleeping accommodations and board, had his help fail to appear for work some morning because they could find employment elsewhere, where they could be fed and comfortably housed. The matter of high school boy cantonments is one that has met with great enthusiasm by newspapers, merchants and boards of education in San Francisco and Oakland, as well as in our own San Jose, and it seems to me that if the operations of the Farm Owners' and Operators' National Association for the year 1920 could bring about this one great solution of the problem of seasonable help it would be a good year's work. The problem can be solved by the united efforts of all growers, but without that united effort the problem is too large.

"Immediately upon taking office the new board will be expected to see what can be done to interest the state government in the conservation of water. During the winter months, as you all know, good rainfall is running continually out to sea and something must be done to conserve part of this water, at least. Wells are being deepened and every year the question of water is getting more serious.

"That the growers approve of the activities of the Farm Owners' and Operators' Association is evidenced by the number of new members who are constantly being added to the already substantial membership which the association enjoys. To November 1st, membership fees in the sum of \$1,556.30 had been paid into the association treasury, and contributions aggregating \$812.00 had been made by friends of the organization toward the expense of its farm labor bureau."

AGRICULTURAL NOTES.

Wild ducks this year got most of the \$70,000 rice crop of the Sutter Basin, doing most of the damage at night.

This year's wheat crop is estimated as being the largest in the history of Bulgaria and worth \$250,000,000.

Approximately 2,000 bushels of wheat will be harvested this year in the district adjacent to Fairbanks, Alaska.

A thousand jars of sweet potatoes represents the crop handled this year by the Merced-Stanislaus Sweet Potato Association.

The State Board of Health, in cooperation with the United States Public Health Service, will extend its campaign for the eradication of ground squirrels to a group of six California counties. Work will be done in San Benito, Monterey, Santa Cruz, Santa Clara, Stanislaus and Merced counties, according to Dr. W.

H. Kellogg, secretary of the State Board of Health.

The season's rice crop of Yolo County is valued at \$2,500,000, according to an estimate of directors of the Globe Mill at Woodland.

Manila has been put upon rice rations. It is estimated that it may be necessary to keep up the ration system until the end of the year.

Thousands of bushels of potatoes in this vicinity will be frozen in the ground this fall because of the farmers' inability to secure hands to dig them.

Two trains bearing American-made farm machinery are now touring Mexico demonstrating modern methods of

agriculture. The tour is being conducted under the supervision of the government.

A great deal of land around Tracy and also in Stanislaus County is being leveled for alfalfa planting. All sorts of soiling crops will also be grown in those sections next season, owing to dairy needs.

A \$70,000 mustard mill is planned by Lompoc growers. It is reported that the mustard mill, which is to be the first unit of a larger mill, will handle the 55,000-bag crop of mustard that Lompoc ranchers expect to grow next year. Growers in Lompoc have agreed to reduce the acreage planted to beans next year and to increase the mustard acreage.

Your Chance Now to MAKE BIG MONEY

Stephens' New Trappers' Book tells you how. Coyotes, Muskrats, Skunks, Wild Cats and all other Western Furs are selling in Denver this year at the highest prices ever paid.

DENVER COLORADO is the Closest and Best Market on earth for Western Trappers and Fur Shippers. Stephens of Denver is the largest exclusive buyer of Western Raw Furs in the world.

STEPHENS charges you no commission—saves you \$60 to \$100 on express or parcel post and you get your money 2 to 10 days quicker—because Denver is closer to your town than any other important Fur Center.

TRAPS AT FACTORY PRICES. Stephens sells Traps, Animal Baits and all trappers' supplies at rock bottom prices. Write today for Big Illustrated Trap Catalog, Trappers' Guide, Fur Price List and Shipping Tags—ALL FREE AND POSTPAID.

The Way the MONARCH Goes Up Hill

is absolute proof that the big, powerful motor has all its power properly applied to give the maximum of traction. That's what counts—the relentless grip on the ground of the MONARCH track. It makes light of hills, grades and loads.

The MONARCH can do unusual things because the underlying principle—the Traction principle—of the MONARCH is right. The weight is evenly distributed and the construction is flexible to allow for grades, side hills, stony lands, rough roads, etc.

MONARCH Tractors

The MONARCH 16-9 is the logical tractor for the average size farm. It has a long track which allows it to develop its fullest traction, a rating of 16 H. P. on the belt pulley, 9 H. P. on the drawbar; powerful enough to pull two plows under any condition or three plows when the soil conditions are favorable; turns in its own length and will work where horses cannot go; it is completely spring mounted, easy to operate and does not tire the operator; it has a belt pulley of the proper size located on the side of the machine. There are three speeds, 1½, 2½ and 3½ M. P. H. with a governor which regulates the motor speed at all times.

Do not confuse MONARCH Tractors with the so-called "track-laying" types. The track on the MONARCH is made of wear resisting manganese steel. We guarantee to duplicate for MONARCH Tractors any written warranty put out by any other responsible tractor manufacturer.

MONARCH Tractors are made in the following sizes:
16-9 H. P., 12-02 and 30-18 H. P.

Write for literature on MONARCH Tractors. We will also be glad to send you our "Performance Booklet."

Alfalfa Association \$5,000,000 Business

(Written for Pacific Rural Press by Manager Geo. Emery.)

Like other food products of California, the production of alfalfa and milo maize has reached mammoth proportions. The vast acreage devoted to these two crops, the economic value of the product and the far reaching markets that are opening are little understood. But if the activities of a state-wide co-operative association known as Alfalfa Growers of California continue (and the service the association is rendering will make certain of continuance and growth) then the real value of California-grown alfalfa and alfalfa products and milo maize, will be known and used wherever such feeds are needed and transportation conditions will permit.

The Association is organized to put modern factory efficiency into the production of these products, and modern merchandizing methods back of their distribution and sale. Already a great volume of business is assured—nearly 2,000 growers, owning approximately 60,000 acres of alfalfa and maize, have combined themselves into this non-profit association, rendering all the services of distribution and sale of members' products on an at-cost basis. The volume of business for the coming twelve months, already assured, is upwards of \$5,000,000.

How is this done? By adding to factory system and merchandizing methods the strength of combination and a democratic organization. It is growing rapidly because its purposes are beneficent, it will survive every attack and prosper because it is democratic, it will earn and enjoy public confidence and esteem because it renders a great service resulting in greater efficiency, wide savings, elimination of speculation and useless profits, and widest distribution of standardized products, all of which inevitably redounds to the good of the two greatest classes—the producers and the consumers.

The purpose is to deliver each producer's crop to the best buyer at the right time and at the least expense. Sounds very simple, but the process involves many activities, and a splendid correlation of all, from seed to sale. It involves improvement of farming methods, lessening costs, increasing yields, developing cost systems to the end that each district knows exactly its factory efficiency and rating; it involves storing, grading, standardizing, distribution and sale of a vast tonnage; it involves a close analysis of each exporting district and conclusion as to the importing district which can best utilize the excess; it involves research and propaganda to open up new districts for both production and consumption, to develop and foster new uses, and, in short, by precept and example demonstrates the true economic position of these two food crops in the political economy of the nation and the world.

These great results cannot be reached under competitive private concern methods of handling and distribution. Only the producer is interested in standardizing his product and establishing it in its true position. The interests of the speculator is best served by keeping both producer and consumer in ignorance of real values, real accounting, and the mysterious machinery of private distribution. Under Association practice the grower will know, not guess. He is learning that the producers combined constitute a powerful machine capable of anything and everything that private interests can accomplish, and, because its efforts are co-operative, non-profit making, and non-competitive it can accomplish infinitely more, and with this strange and wonderful difference—the advantage gained in efficiency, economies, better grading and better distribution, are all to the benefit of those who need the advantage—the producer and the consumer.

It can be accepted as axiomatic that for every food product there is a willing buyer at some time and some place and at a fair price. The prob-

lem is scientific distribution, and under the Association plan that science is in the process of demonstration.

This sort of constructive co-operative work will spell the doom of those two arch fiends besetting the unorganized producers—Demon Glut and Fiend Famine.

PERMANENT STATE FAIR.

An all-the-year-round exposition at the State Fair grounds is the project launched for the commendable purpose of using the State's great investment there all the time instead of a few weeks each year. At a meeting of the California State Fair Exhibitors' Association, recently, E. Franklin, a State Fair director, pointed out that approximately 100,000 tourists and visitors had stopped in Sacramento the past summer. It is easy to see that all sections of the State would benefit by having a concentration point to which prospective settlers could come, and get a birds-eye view of the entire States' products with information where each industry is already thriving. The Exhibitors' Association called upon the State Agricultural Society, Chambers of Commerce, Boards of Supervisors, and others to write in urging the next Legislature to appropriate funds for the purpose.

There has been considerable activity in the poultry export trade. Local dealer have been shipping heavily to Honolulu, mixed large grades making the bulk of shipments that total about 100 dozen a week. The chickens are shipped alive to supply a market demand, mostly from Chinese, who practically control the retail market trade in the island port. Turkeys have not been moving to Hawaii extensively yet.

Picking of cotton on the Tagus ranch, north of Tulare, is about finished. From the 860 acres there will be at least 1,000 bales. This is the first big acreage of cotton to be grown in Tulare County, and the ranch owners are so well pleased that they are planning to install their own gin on the ranch.

The Santa Cruz County Farm Bureau is reported to have asked permission to appropriate water from various creeks to irrigate 12,000 acres.

Did you ever "ride the swells" in a sailboat? Then you know the sensation of gliding along with no bumps or jolts or side jerks. That's the way you ride when you have Float a Ford Shock Absorbers on your Ford. Every road is a boulevard—no bumps, no side jolts.

On Front Springs

On Rear Springs

SHOCK ABSORBER
Float a Ford
Makes a Ford even Better

Complete Set (front and rear) only \$18.50

Two strong steel springs check the down-thrust of bumps, while the third absorbs the up-thrust of the rebound. They are constructed to counteract side jerks. They permit free action of the wonderful Ford springs. They are attached without drilling frame or axle. Try a set—make your Ford ride like a yacht skimming over the gentle ocean swells. As durable as the car itself. Your money cheerfully refunded if not entirely satisfactory.

Labor Problem Met by Co-operation

(Written for Pacific Rural Press by D. J. Whitney.)

The Labor Problem Solved! That announcement certainly would create excitement throughout rural districts and it looks as if co-operation by the growers would go a long distance toward solving the problem, just as it has gone far toward overcoming marketing troubles.

Three years ago the I. W. W.'s around Fresno were talking about a very nice farm labor union that was going to make everything smooth and lovely in crop harvesting and other farm work. The practical effects worked out about as beautiful as the Bolshevik regime in Russia. But the farmers stepped in with a big mass meeting, organized the Valley Fruit Growers' Association to attend to labor matters, and conditions have been getting better ever since. Even without governmental and public opposition to I. W. W.'ism and related insanity, it would be difficult for any mis-called labor movement like that of three years ago to get a real foothold in the district while everything is going as it is now.

The association was started by public subscriptions of farmers of 5 cents per acre and one of the first steps taken was to open an employment agency, which acted as a clearing house between the worker and the farmer who needed help. Later when the State opened public employment offices this part of the activities of the Association was passed over to the State, the association receiving as full benefit from the division of duties as it had before.

Growers Well Organized.

One of the reasons for the success of the association is the fact that the growers are well organized already, in a way, through the Associated Raisin Company, and the Peach Company. It has the moral support of both companies; and the abilities of leading men of each, as well as of other prominent fruit men, are used in its directorate. W. Flanders Setchel, a prominent fruit shipper, is president; Chas. B. Harkness was the first manager and O. V. Cobb the present manager.

One of the great services of the association is in stabilizing the labor supply and wages also. A man who has been used to vineyard work drifts in and wants to know about prospects. He learns about them and tells about the amount of work, wages, or labor supply where he comes from. If what he says is verified by what others write, Manager Cobb learns that he can, or cannot, get a number of men from that quarter. This is one method of learning when and where to advertise for help when labor is needed locally. Then men who have worked from the office before, write, wanting to know when the busy time will start and are told when to come or not to come.

On the other hand, large growers send in word as to the number of men they will want, when they will want them, and what they expect to pay. This gives a line on the amount of help which will probably be needed. Help is brought in as needed, by advertising in other sections, particularly in those where there is a surplus of labor, the amount of advertising depending upon probable demands. A big surplus of labor brought in by advertising would offer a great field for trouble.

Occasionally, Manager Cobb will make a special trip after help. Once, for example, a large rancher came in and said he wanted 100 men within a short time. Cobb went right up to

Stockton and went to the public employment office, but on account of his position as agent rather than actual employer, could not get what he wanted without a good deal of red tape, so headed for the part of town where common labor would likely hang around. He handed out a lot of cards, and in one afternoon raked up his hundred men.

Explicit Understanding Between Employer and Employee.

A record is kept of every man sent out, with an exact understanding of wages and terms of employment. This makes it possible to straighten out every difficulty developing between laborer and employer. Once or twice there has been a difference of opinion as to wages, based as a rule on book-keeping records; and in every case this has been adjusted with satisfaction to both parties. When a man proves unable to hold a job, and useless or a trouble maker, he is never sent out again. There are men around Fresno who cannot get a job either through the Association or the State employment office. This prevents trouble-makers from annoying good men.

Before every busy season, whether harvesting or pruning, the directors meet and decide what is the proper wage, based upon conditions elsewhere, as well as in the district, and this, in a way, governs wages through the district. The directors do not always hit it right, and in 1918 had to raise the schedule for grape picking, but without any particular harm being done.

Community Camps.

About the biggest proposition undertaken is the establishment of community camps by the Association. The first, and trial camp, was put up at Fowler, for about 80 men. A model tent is supplied every two men, with tight floor and fly-proof walls; meals are supplied at cost prices, and a camp supervisor, as required by the new State law, is kept to see that everything is in order; also to see that work is done as it should be on the ranches where the men work. Then the ranchers who are members of the Association can come in with their machines and take out the men every morning, without the expense of providing accommodations, or cooking and caring for more men than the ranch usually holds. The cost to the rancher is merely regular pay for regular work. Association members can hire men from the camp, others can not. Membership privileges are 10 cents an acre, charges having advanced, owing to the greater scope of work taken up by the Association, beyond what was first planned. With State requirements for labor camps it is now an expensive thing to provide accommodations for a bunch of men and the saving of expense and trouble to a large rancher in having his own camp is large. The community camp idea is only on trial, but it promises great things. If as successful in practice as in theory it is only a question of time until they spread over all the State.

As a matter of fact it would be a great step forward if there was such an association in every section of California. It brings help to the place needed from the place where help is scarce, keeps the farmer supplied with help when needed, without making an over supply, thus eliminating a fertile field for I. W. W.'ism. By keeping a record of the men it prevents the I. W. W. loafer and agitator from disrupting conditions and so helps everybody concerned.

BURBANK TOMATOES DOUBLED SALES.

After trying many varieties of tomatoes for sale to the local market, C. H. Hughes of Santa Cruz County has discarded all but the Burbank and the San Jose Canner. The latter is a good, well-meated variety, but the Burbank has considerably the best flavor, the most sweetness, and general good qualities of all the varieties

tried. It precedes the San Jose Canner in ripening, so the two make a good succession to keep the market supplied during the season. Mr. Hughes felt long ago that local tomato sales could be greatly increased by supplying only well packed fruits of the best quality. Toward the end of the 1919 season, he surprised the store people who handle his tomatoes by showing that they had sold twice as many as they did last year.

Lady Randolph Churchill writes a tribute to Mr. Edison

LADY Randolph Churchill is England's greatest authority on furniture. Her home is the best furnished house in London.

Lady Churchill saw the Edison Period Cabinets. Immediately she wrote:

(HER LETTER)

"What an extraordinary man Mr. Edison is! He perfects his phonograph to a point where its realism is astounding. Then he determines to make each Edison Phonograph, even the least costly an attractive piece of furniture. Instead of the usual dentist-like looking cabinet, his designers have succeeded in putting the character and feeling of the best periods into his phonograph cases. These graceful and artistic productions will be hailed with delight by all who can afford them, and will cause Mr. Edison's new phonograph to be received in many houses where less worthy machines have not been welcomed heretofore."

Sheraton
(Sans inlay)

These Edison Period Cabinets are American adaptations of Europe's richest furniture treasures. This letter is the Old World's stamp of approval on the

achievement of Edison's American designers and craftsmen.

BUT Lady Churchill has overlooked the second great part of Edison's purpose. She has received the impression that these cabinets are only for the well-to-do. Nothing could be farther from the fact. Edison has developed an authentic period cabinet for each New Edison,—even the lowest priced models. Isn't this exactly what you would have expected of the man who spent three million dollars in order to give the world his musical ideal,—the Official Laboratory Model?

William and
Mary

THE New Edison is truly the phonograph of two arts. It brings you the world's noblest music, RE-CREATED in all its beauty and soul. It brings you the world's purest furniture art perpetuated in furniture which will enrich your home forever.

See the different period designs. Hear the wonder of RE-CREATED Music. If no Edison dealer is near you, write for the beautiful new book, "Edison and Music."

Tractor Rice Binder Saves Entire Crop

Written for Pacific Rural Press by R. E. Hodges.

This year's rice crop, planted on 140,000 acres in California, was recently estimated at 350,000,000 pounds by President J. H. Stephens of the Rice Growers' Association. That is a low yield of 2500 pounds per acre. In 1918 the yield averaged 3,000 pounds. This year's crop is valued at six cents per pound. It has been harvested in ideal weather conditions, so the quality is first class and the demand is strong.

Wasted 14,000,000 Pounds of Rice.

Under normal conditions with a crop like that of 1919 well over 100 pounds per acre were wasted. Some of it will be of value for hog or turkey feed, but its value for that can not be over one-quarter of what it would be for market. We may figure a dead loss of about \$4.50 per acre this year due to our method of irrigation and harvesting. The man who has a quarter section of rice is a small planter. Yet this year, due to common methods of harvesting, he lost \$720 worth of rice.

How Do We Figure the Loss?

Very few rice growers have believed it would pay to level their land into rectangular checks. A great deal of it is over hardpan anyway and it would do no good to expose hardpan. Three years is about the limit of consecutive planting of rice. The low average yield this year is due largely to the ignoring of this fact by many planters. No one wants to put out a lot of money leveling and checking land in squares for three years. So practically all rice leveling and checking is in contour checks, each generally containing one to ten acres. The levees are steep and high so a binder cannot well go over them. They twist in all directions worse than a snake in convulsions. Often they come close together and then separate far apart. In harvesting, one of three choices is possible. The six-foot width of rice each side of each check may be cut by hand sickles if labor can be found to do it in time to get the rest of the crop off before rains make

the fields impassable. The regular rice binder may be hauled around inside each check, knocking down the standing rice and mixing into the mud that generally is softest next to the checks. Three or four horses walking through the grain knock down and thresh out quite a bit of it. The wheels of the binder roll a good bit more into the mud. It is commonly estimated that one-seventh of the

binder. In the mud that is commonly encountered at rice harvest, the binders sometimes cannot be pulled by horses, much less could they be pushed. The binder weighs about a ton. When operating with horses it exerts a pressure on the mud somewhere around 75 pounds per square inch.

To devise a means of reducing the pressure per square inch and to avoid

country and he knew there was a keen desire for something workable along this line. So, when W. J. Shepherd designed a rice binder suitable for a special tractor which he intended to build for it, Mr. Abildgard pooled ideas with him and the result was an equipment by which any eight-foot binder could be put on the front of a Monarch 32-18 tractor in two two hours and removed in about the same time.

Mr. Abildgard's specifications for such a combination are given in his own words:

"In order for the machine to be a really practical outfit, it must be built on a tractor that is an all-around practical machine for every condition of work that the rice grower has to contend with. It must be a light-weight machine and have plenty of clearance and must be balanced in the center. A specially built tractor that could not be used for other work besides carrying a binder would be a failure on account of the extra investment.

"The only changes that we make on our tractor are to put in a ninety-inch axle and bore four holes in the front of the frame. The binder is mounted on an oscillating frame that is raised and lowered by the binder operator with one hand. We have a leverage of sixteen feet against eighteen inches to lift the binder. A 375-pound weight on the end of the beam easily balances over 2,000 pounds in front of the tractor. All of the weight of this attachment is carried on the axle and not on the frame of the machine.

"The cutter-bar of the binder is wider than the tractor; therefore the tractor is traveling only over stubble that has already been cut. We do not run over a spear of rice."

Only Four Pounds Pressure on the Mud.

One might think that a steel tractor plus a binder and counterweight would exert more pressure and would mire down sooner than the binder alone. But this outfit instead of push-

Rice binder mounted on the front of a tractor. It cuts rice on the first round inside each check without tramping or rolling any of it in the mud. This is working where a horse-drawn binder got stuck. The outfit exerts only four pounds pressure per square inch.

average rice crop is included in the first round in each check. About a third of the first round is put out of commission by horses and binder, able to be recovered only by hogs and turkeys. Thus 2,500 pounds per acre harvested comprises what is left after about one-twenty-first of the crop is lost.

Tractor Binder Wastes No Rice.

The third possibility open to the rice man is to devise a means of cutting the rice next to checks before horses or binder run through it. This at first thought would mean a push-

running over standing grain would not only save over 100 pounds of rice per acre, but it would reduce the miring of machinery.

This problem has received attention from several manufacturers; and at last two or three different tractors were used in attempts in 1918 to solve it. These required additional study to make them satisfactory, and we are not aware of their being developed further this season.

But another tractor man carried the bee in his bonnet. William Abildgard had been selling tractors in the rice

We Manufacture Levelers for Any Power from 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler

WILL WORK WONDERS ON YOUR FARM

Moving immense amounts of dirt daily, and working on ground too tough for horses and Frenos to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners' time, labor and money.

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

A GREAT ROAD MACHINE

Every road district should own one of these machines for constructing roads. They will cut down the high places and make fills quicker and cheaper than by any other known method.

YOU SHOULD

CALIFORNIA HYDRAULIC ENGINEERING AND SUPPLY CO.

68 Fremont St.,
SAN FRANCISCO

420 E. Third St., Dept. A,
LOS ANGELES

ing down 75 pounds per square inch has only four pounds pressure per square inch.

The difference is due to the long track of the machine and to the plank 19 inches long bolted to each shoe in the track. This gives the machine over 2500 square inches of bearing surface. Its total weight, including binder, is less than 10,000 pounds. The slight pressure per square inch explains why the machine in our illustration is working over a spot where a horse-drawn binder had been stuck and temporarily abandoned.

CALIFORNIA NEEDS GREATER ELECTRIC DEVELOPMENT.

"The light and power situation in California this year offers nothing to worry about," declared H. G. Butler, power administrator of the State Railroad Commission, recently. The present rate of consumption of energy would deplete the storage supply of water used for generation of electricity by the latter part of December if no rain should fall. If the shipyards resume operations soon, they will use so much electricity that the water supply will not last so long. But we expect rain to save the situation.

This state, in addition to its oil fields, has a potential supply of hydro-electric energy greater than any country in Europe. This relieves us from great dependence on coal. Our electric power should be developed to its highest point. To take care of the normal power needs of California due to normal growth, something like \$60,000,000 a year must be spent for hydro-electric purposes. This will use water for power before distributing it for irrigation. Our recent legislature passed a law permitting irrigation districts to generate electricity for use and sale; and Congress has a bill before it to further encourage hydro-electric development.

PERMISSIBLE MOTOR TRUCK LOADS.

In the enforcement of that part of the Motor Vehicle Act, which relates to permissible loads of motor vehicles, the following procedure shall be followed:

The actual width of tire coming in contact with the surface of the highway is to be considered as the width of bearing on the highway for the wheel under test. Eight hundred pounds per inch width of tire is allowed on rubber-tired vehicles.

The vehicle with its load, if any, shall be weighed first with all wheels on the scales. Then each axle load shall be weighed separately by running the front wheels and then the rear wheels off the scales alternately. If the sum of the observed weights of the two axle loads does not equal the total weight of the vehicle and load, as aforesaid, subsequent trials shall be made with the vehicle moved forward or back, as required, until the sum of the two axle weights does equal the total weight of truck and load. Each wheel will be assumed to carry one-half of the axle load of the axle to which it is attached, except in the case of dual wheels when each will be assumed to carry one-quarter of the said axle load.

ADJUSTED DISK PLOW AND SAVED POWER.

The new three-disk plow stuck a 12-25 tractor in Geo. D. Gilman's orchard in Santa Clara County. The ground was soft on top, but hard underneath, and many plum suckers were growing through it. Mr. Gilman found it impossible to cut deep enough to keep the rear wheel on the ground. The disks were set so nearly vertical that they had to simply push and break away the furrow slice, and it took too much power. Mr. Gilman set them much more horizontal, so that they cut the dirt without having to push and break it. The plow worked fine after that, for there was less friction on the disks.

It is well to know that aside from the switch wire and one cable leading from the magneto to each plug, a high tension magneto has no external wiring.

100 Cents on the Dollar

THE tractor that is really a 100-cents-on-the-dollar investment for the farmer is the tractor that can be used practically every day of the year, one that is 100% efficient, both on the belt and the drawbar.

The International 8-16 kerosene tractor meets the above specifications. The drawbar has a wide range of adjustment both up and down and sidewise so that the tractor will pull any machine or implement on the farm with equal advantage. The 8-16 pulley is so placed that the tractor can be backed into the belt quickly—so placed also that the belt doesn't rub against any part of the tractor nor drag on the ground. And 8-16 power is just right—neither too heavy nor too light—it fits practically any drawbar or belt power task on the average farm.

Aside from its adaptability for all-year-round farm work, the International 8-16 tractor is a 100-cents-on-the-dollar investment because of its exceptionally efficient and economical (kerosene) operation; because, too, you can always secure repair and expert service without delay through the 92 branch houses scattered over the United States. Your dealer—wherever he is—has a Harvester branch in easy reach.

If you are interested in a 100-cents-on-the-dollar tractor investment just write your name and address along the margin of this advertisement and mail to the address below so that we can send you full descriptive information of the International 8-16.

The biggest order ever placed for magnetos is that of the Fairbanks-Morse Co., when they decided to equip all of their model Z engines with Bosch magnetos.

Sharp implements are cheaper than the extra power required to use dull implements.

Mechanical Power on the Farm

ORCHARD TRACTOR PROVES ECONOMICAL AND EFFECTIVE.

(Written for Pacific Rural Press.)

What should we figure for repairs on a medium-sized wheel tractor the first year? R. L. Dunshee, who has run a 12-20 tractor practically a year, has had not over \$25 repairs. His chief trouble was a broken ball in a ball bearing. The tractor stands ready for another year's work and cannot be said to have depreciated greatly. It belongs to Jas. E. Brown of Santa Clara County. Since it was bought last January, Mr. Dunshee has plowed about 125 acres, and disked over 1,000 acres, besides checking up many orchards for irrigation and furrowing out other places. More plowing would have been done had not the season been so short last spring. A ten-acre field for row crops has been leveled and some spots in the home orchard of ten acres have been put into better shape for irrigation. A two-disk orchard plow is used in preference to a three-disk plow built for the same tractor, because with two disks there is no danger of getting stuck and the engine is not overworked. Five acres a day are turned over with this outfit. The seven-foot double disk cultivator could work 25 acres per day of ten hours, but where trees are too close together, the third time through a row does not cut full width, and the daily average acreage is reduced to about 20, as estimated by Mr. Dunshee. The tractor uses about 15 gallons of distillate per day of ten or eleven hours.

Mr. Brown also owns two horses on account of the row crop field. Only one of these will be kept next season for this purpose and to do light jobs around the orchard. The disk plow leaves an eight-inch strip when plowing away from the trees and a horse is handy to finish this as well as to haul out pruning brush, etc. However, for the orchard alone, it would be a question whether it would pay to keep a horse the year around for the little work it would do. A neighbor using a similar tractor puts a walking plow and a man behind it to finish the plowing next to trees. He figures that the waste of man and tractor power on this job costs less than to maintain a horse. Probably a better way would be to hitch a walking plow behind the tractor plow on the last round next to the trees. This should not overload the tractor, for plowing is usually shallow there anyway, and a wider strip may as well be turned. To make this economical, the final rounds would be left until all of the middles are plowed. Thus the walking plow would be put on and off only once, and its operator would be kept busy until that part of the work is done.

This wheel tractor is no worse than many others on sandy soil, but it has rested on its belly in the sand while the wheels spun around in holes they had dug for themselves. Mr. Dunshee has learned to stop the wheels when they begin to dig in, and fix up a better footing, lighten the load, or do something else to avoid slipping the wheels.

ROTARY PUMPS.

Promising rivals of centrifugal pumps are rotary pumps which likewise require pits. Rotary pumps are no new things, but have been in use for a great many years and are of many designs. Their advantage is a high efficiency, provided they are in good shape, so that far more water will be given for the amount of power used than centrifugal pumps will give. Absence of valves is also a great advantage. The trouble with pits and rise and fall of water level is the same with both rotary and horizontal centrifugal pumps.

The greatest fault with rotary pumps is that they wear out quicker than is desirable when there is much sand in the water. Slow speed of operation reduces this wear, but the only way to reduce it greatly is to reduce the amount of sand pumped.

If a person could have them pump from a dug well, from a lake, or slow stream with clear water, or in fact any place where the amount of sand was insignificant, their merits would make them highly desirable. Theoretically they have always been considered good, and improved designs and guaranteed service for definite periods makes them more desirable now than they once were.

GAS CAUSES PUMPING PROBLEM.

To the Editor: Following an article on selecting an irrigation pump, I desire to submit a small problem of my own. I have only ten acres and cannot put in an expensive plant, such as a deep-well turbine. My pit is 20 feet deep and I get water for a 3-inch centrifugal pump, but it does not work well on account of there being gas in the well. I am afraid that there will be too much sand for a rotary or plunger pump, so if you can give me full information on compressed air I would be obliged. The well is 130 feet deep, the casing 6 inches and the lift 30 to 40 feet. Are air compressors complicated, or are they not a success? I would like 200 to 300 gallons per minute. What size pipe and what h. p. will I need?—H. S., Thornton, Cal.

(Answered by D. J. Whitney.)

The article you refer to was written from the standpoint of ranch experience and not as a trained expert on the subject, and this answer will be given in the same way. The presence of gas is the usual excuse for installing a compressed air plant. They are rather expensive and the amount of water supplied is rather small in proportion to power used. Mostly they are on large ranches. Unless your well gives more than an average amount of sand, I believe that a rotary pump would serve you best, as the presence of gas in the water will not bother them at all, and you can doubtless get a guarantee for wearing qualities. Gas will not bother turbines, but these usually are installed where much larger streams are required than you will need. There are also plunger pumps without leathers that sand will not affect to speak of. There is sand in every well in California, but plunger pumps are a great success, and do not be afraid of them unless the sand is very coarse and abundant. They are, of course, somewhat expensive. The horsepower required and size of pipe will depend upon the kind of pump you install. Would advise your communicating with pump men handling the kind of outfits you think you would like, and finding details from them. By having continuous operation 100 gallons per minute should be all the water you would want; and remember also that a small stream means a smaller, less expensive plant and one that will draw the water down less in the well than a large plant. Compressed air pumps will probably be your best equipment for greater capacity.

AUTOMOBILE PASSENGER MILEAGE TREMENDOUS.

There were 5,000,000 automobiles in regular use in the U. S. in 1918. This indicates that at an average annual mileage of 3,000, which is low, the total mileage is 15,000,000,000 miles per year. This, multiplied by an average of three passengers, means a total passenger mileage of 45,000,000,000. The passenger mileage of automobiles exceeds that of the railroads by over 10,000,000,000 miles. (In 1915 the official railroad passenger mileage was 32,384,247,563.)—National Automobile Chamber of Commerce.

A low radiator and sheet-metal fenders, adapted to the Holt 45 caterpillar, makes this machine as low, as narrow, and as short as a two-horse team. This is especially built for orchard work, though the tractor itself is not greatly different from the one used in grain fields and which looks so big.

If It's Mounted on Timkens

Remember the *tapered* shape of the Timken Bearing. That tapered design has brought about the superiority of performance, which in turn has led to the adoption of Timken Bearings by the best motor car, tractor and truck builders of America.

The rear wheel of your farm truck hasn't quite as hard a job as a front one, but it needs Timken Taper just the same.

A little skid, a graze of the curb or sidewise blow from a rut or a stone gives a tremendous end thrust to the bearing. Measured in pounds the end thrust that comes from a two-inch drop of a loaded truck would startle you.

And a trifling looseness—which is bound to come with a bearing that has no take-up for wear—the take-up that Timken Bearings do have—means a considerable play at the circumference of the wheel and rapid wear on tires.

Every year adds to the list of truck builders and truck owners who appreciate the advantages of Timken Taper.

It doesn't pay to overlook the things that don't cause trouble.

THE TIMKEN ROLLER BEARING COMPANY
Canton, Ohio

TIMKEN TAPER

PUMP SUPPLEMENTS SHORT GRAVITY WATER

Floods run from Arroyo Seco in Monterey county to the Salinas river and thence into the sea. But they are generally all gone by July. The Clark Colony Water Co. has a ditch which diverts some of the floods to the fertile orchards and alfalfa fields around Greenfield. But when the ditch goes dry the alfalfa goes dormant and the fruit growers have already done some good cultivation to tide their trees over the crop-bearing period. Of course a dam and reservoir in the Arroyo would save the floods for use late in summer, but the land holders haven't figured that the expense would be worth while. Meanwhile, a bunch of the colonists have formed The Greenfield Water Company, to pump water to supplement the gravity water on about 400 acres.

When we met W. R. Johnstone, who is interested in the new project, they had bought 20 acres above the canal and sunk a test well 240 feet. Water-bearing gravel was found at 100 feet. The bed was found to be 112 feet through, with tighter ground below. A \$10,000 pumping plant was planned to deliver 1,500 inches of water. The well proper was down 100 feet with 24-inch casing to go 50 feet farther and 16-inch casing to penetrate thence to the bottom of the gravel bed. They will use the Clark Colony Water Co. ditches and irrigate colony land exclusively, except 10 acres of the twenty on which their plant is located. Thus will these ranchers be rendered fearless of water shortage. The extra alfalfa crops they can cut or the extra fruit they will gather will repay their interest, maintenance, and depreciation accounts with a goodly balance to absorb as profit.

There is a movement on foot to license tractors.

PROPER TRACTOR LOADS.

There is frequent talk about overloading tractors, but something can be said for underloading also. A certain San Joaquin valley fruit grower states that his orchard tractor seems to go along far more smoothly and nicely when it has the kind of a load that it is supposed to pull than when it is doing light work, like furrowing out with a two-horse tool. Doubtless there is no injury from having a very light load, even if the tractor does not seem to work as well as when it has more to pull. However, it would seem that as long as a team is kept upon a ranch where tractors are used, horses can very well be used to do the work that they can do easily, leaving the tractors to do the heavier work that a team cannot do.

MORE WORK DONE WITH FEWER MEN.

Sixteen "men" had jobs on W. E. Vaughan's ranch in Kern county last May, but acquaintance with work horrified them. Only two stayed on the job. There were 150 acres to be leveled for pump irrigation. Mr. Vaughan could have gotten a battery of Fresno scrapers at \$30 apiece. But they would do no good with no men to run them. So an eight-foot Schmeiser leveler and a dozen mules were purchased. The two men who stayed leveled the 150 acres before August 1. Last fall Mr. Vaughan planned to use a tractor on the leveler to get 640 acres in shape for a cotton crop in 1920.

WHICH OIL FOR TRACTOR?

There are those who may hesitate to buy a tractor whose successful operation depends on one certain brand of oil. Dealers who insist that tractor buyers use a certain oil in order to get the benefit of their guarantee are more than likely to be getting a profit on the side which the tractor manufacturers do not countenance. This practice was tried in the automobile trade and discontinued. When a tractor buyer feels compelled to use a certain oil under these circumstances, he is justified in asking the manufacturer direct. The answer is likely to be a list of several brands, any one of which will prove satisfactory to all concerned.

"TRACTOR TENANTS WANTED."

The owner of a 45,000-acre ranch has written to a California tractor manufacturer asking for ten tractor farmers to replace tenants who had been farming part of the ranch with horses. They have observed that the tractor-farmed part of their ranch has been better cultivated, is in better shape, and has in general produced better crops. The terms of rental are one-quarter share to the owner. The soil is black, loose plow-land, which produced in 1919 about 20 sacks of barley per acre and up to 16 sacks of wheat per acre.

DANGERS IN SCRAPING CARBON.

Leakage of water and power, where the removable head of an engine should be tightly fitted to the cylinders but isn't, is often caused by getting carbon in the studholes while cleaning it from the firing chamber. Then the studs cannot be tightened enough to prevent leakage. There will also be considerable carbon in the water system which will clog the radiator, and the engine will run hot. Stuff the stud holes and water-jacket openings with waste or cloth before beginning to scrape the carbon.

The Avery tractor hitch book, showing hitches for attachment of all kinds of farm implements to tractors under various conditions, will be sent free to all who apply for it. Diagrams illustrate the various hitches clearly and in detail.

"Optional ignition" will be a feature at the New York Motor Show in January. One dealer reports that 90 per cent of his advance orders for optional ignition 1920 cars have specified magneto equipment rather than batteries.

Hardpan and plowman are promoters of poverty, unless broken up with dynamite or subsoilers.

Investment in labor-saving machinery is cheaper than investment in labor when you can't get the labor.

GRINDS
ANYTHING
GRINDABLE

FEED 1 IN 5 ANIMALS FREE!

That's what you do when you feed ground feed and by so doing utilize the 20 per cent of grain which, when fed whole, goes to waste!

But grind your own feed! Grind it the cheap, quick, and easy way with a Letz Dixe—the mill famous for its patented self-sharpening Steel Grinding Plates.

These plates have thousands of Keen-cutting, scissor-like edges—in one operation cut, grind, and pulverize to powder any-

thing fed into them. Won't clog on stuff damp, wet or oily. Are self-sharpening—silent, trouble-proof. Convert your alfalfa, roughage, and all other grindable materials into the finest of balanced rations and combination feeds. Enables you to use your poor grades and sell your A-1's! More profit!

Unbreakable in fine-cutting, light-running, capacity, durability. One set plates guaranteed to outlast 3 ordinary sets.

Co-operation of Dairymen Ably Defended

THE USEFULNESS OF MILK AND DAIRY PRODUCTS as food has been known since the dawn of civilization, although but little thought has been given to this important fact. We have just awakened to a realization of the importance of the cow, the foster mother, who dispenses the one perfect food without which the world could not be nourished. In that food there is a mysterious something which scientists have found essential to the highest health of the human race and which can be found nowhere else. Without her milk children languish, the vigor of the adult declines, and the vitality of the human race runs low.

There are in round numbers in this country, twenty-three million dairy cows which produce 89,000,000,000 pounds of milk. Large as this amount may appear, it is not sufficient for one full glass per capita per day for the population of this country, when other dairy products are taken out of the total supply.

Consider the large amount of milk necessary for child feeding and ask yourself if upon this extremely narrow margin the dairy industry of the United States can be said to be safe.

Last year over 19 per cent of all food eaten in this country came from the dairy cow. Of this 89,000,000,000 pounds of whole milk produced, 43.1 per cent goes for direct consumption, 4.3 per cent (over 3½ billion pounds) fed to calves, 5.0 per cent cheese, 2.9 per cent condensed, 3.7 per cent ice cream, 41.0 per cent used to make butter; and of this 41.0 per cent used to make butter, 4 per cent becomes butter, 12 per cent buttermilk, and 84 per cent skim milk. The people do not realize the food value of dairy products, or there would not be this under-consumption of them.

Slept on Its Rights Too Long.

Because the dairyman has lacked anything like a realization of the size of his job, or the utter dependence of the human race for its very life upon the milk pail, the dairy industry has long slept upon its rights and allowed itself to become the football of petty politicians—the prey of organized spoilers and speculators, and the sport of the civic uplifters who cannot see the cow and her attendant dairyman because their eyes are filled with the image of the city milk bottle. How many aldermen and mayors have climbed into public favor as noisy defenders of the milk bottle, with sublime indifference to the fact that their "reforms" were well calculated to kill the cow from which the bottle must be filled? Last winter, if it had not been for the activities of the dairymen, there would have been a milk famine in a number of California cities, which would have been a calamity, and the responsibility of such a calamity would fall on these agitators.

We have been shaken from our trance. We saw two things: That we must pull together if we were to save this all-important industry from political and commercial greed, that organization was our only method; so the Associated Dairymen, like all other co-operative associations, was born of necessity and with the object of putting the dairy industry on a sound, economical basis, and making every human being, from the dairyman himself to the city consumer, respect the cow as the most marvelous food factory known to man.

The real reason of our Association lies in the necessity of service to be performed for the producer and the consumer of dairy products; by improving the conditions under which the dairy products are produced, elimination of waste, and generally by doing such other things as are necessary with respect to the cost of production, quality, more economic manufacture, and better and more even distribution of these products; thus increasing the returns to the producer and lowering the cost to the consumer, that the interests of both may be promoted.

The failure of the farmers' co-oper-

A speech delivered before the Fresno Bankers' Association by J. M. Henderson, Jr., president of the Associated Dairymen of California. In a letter submitting this speech for publication, Mr. Henderson says: "I appreciate very much the friendly spirit shown by the Pacific Rural Press to our Association."

ative creameries in the past years has demonstrated that their associations were not properly organized. Many failures have been caused because the members were at liberty to withhold their raw products and send them to a competitor of their own creamery. If this competitor was willing to maintain a seemingly high price over a long period, he would be able to get so much of the raw product from the co-operative creamery that the latter would be forced to close. Our Association has bound its members by a tightly drawn agreement to market all of their dairy products through the Association for a term of years. They are absolutely bound to market all of their products through the Association.

The Association recognizes that those who are now performing the service of manufacturing and marketing the dairy products are specialists and have had long experience in their several lines of work. Therefore, our Association does not aim to destroy the structure they have built, but seeks to absorb and remodel the present many organizations in such a way that they will be working for the best interests of the dairymen. Without doubt there are more manufacturers and handlers of the dairymen's products than are needed; many will necessarily be eliminated. Our Association, however, desires to co-operate with the well-organized concerns and form them into one organization in order that they may work in one direction instead of many different directions as at present.

It must be borne in mind that the object of our Association is to handle the products with greater economy, to head off profiteering, and eliminate waste, to the end that the dairymen will receive a greater net return, and be able to sell the consumer at the lowest possible price. Beginning with the delivery of the raw product from the farmer to the factory, our aim is to perform each function with the least labor, fuel, and materials, keeping in mind at all times the necessity of maintaining a high standard of quality.

Unnecessary Duplication of Service.

In many sections of the country the creamery men have assumed responsibility for gathering milk and cream. On account of keen competition and their desire for volume of business, many creameries are sending their trucks over the same routes, thereby increasing the cost of handling. This increased cost must, and does necessarily fall upon the dairymen. Our Association will effect a big saving, as routes are being formed in such a way that there will be no duplicated effort, and the milk and cream are delivered to the nearest factory, reaching their destination in good condition.

One of the most important activities of our Association is the proper grading of the raw product and the payment of different prices to the producer for the different grades. The keen competition of the creameries for the dairymen's product has prevented them from doing this, and the Association, having full control of the products, is able to enforce this grading system. The dairymen handling their products through the Association, from the cow to the consumer, feel a great responsibility for the quality of the milk and cream delivered to the factory, and the result is a higher standard of the finished product.

The Association feels that in order to have a brand of dairy products which will stand first in the world's markets, it must have quality, uniformity and quantity. Quality will be attained by the system mentioned above and by proper methods of man-

ufacturing and handling the product. Uniformity will come by the use of uniform methods and materials in the manufacture of the products, and quantity will be the natural result of a large organization.

Securing Uniformity of Product.

With a sufficient number of general utility plants, in which all known dairy products can be manufactured, under the control of the Association, a uniform product can be had and maintained by adopting uniform methods and uniform composition of the products manufactured, and by employing expert field men who will assist the different plants in turning out uniform products. Laboratories will be established and chemists employed to analyze samples from every churning, or every vat of cheese. This not only provides a check upon the uniformity of the product in moisture, salt, and color, but it also gives a check, to a very great extent, upon the efficiency of the men in the different plants. The duty of the field men is to visit the different plants and aid the men in charge in bringing their product up to the standard. They will also standardize the methods for doing the work in the plant, introduce labor saving methods, equipment, and many other things. There can be no question but that our product, under these conditions, can be made practically uniform every day in the year. The Association, having these plants, can buy supplies and equipment in large quantities and thereby make big savings in the cost of manufacture.

The speculator fixes the price the dairymen receive on a butter fat basis, which is fundamentally wrong. Through the instrumentality of the utility plants, the Association hopes to establish a uniform price on the basis of a hundred pound weight on the farm according to butter fat standard. This will prevent competition among themselves. When the price of whole milk goes up in the city, the dairyman in the country stops skimming his milk and sends it to the city, which creates a surplus that heretofore, as Dean Hunt of the University testified before the Legislative Investigating Committee, went to waste. This surplus, if any exists hereafter, will be converted to some use in the utility plants, making condensed milk, powdered milk, butter, cheese, condensed skim, condensed

buttermilk, sugar of milk, casein, albumen, etc. In many sections of the State there has been no means of handling the skim milk and other products; they have been allowed to go to waste.

The present system of fixing the price of our product on the butter fat basis has permitted profiteering on the part of certain manufacturers who buy our whole milk and pay us only for the butter fat, securing for themselves the revenue from the by-products.

There are certain interests in this State which would like nothing better than to see the organization of the dairymen disrupted and its members once more in their clutches, and they are moving heaven and earth to bring about such a condition. They have been carrying on a propaganda of misrepresentation, innuendo, and slander in expectation of creating discontent within the Association and

THE OTIS HERD

WILLOUGHBY, OHIO.
Milking Shorthorns

LADY OF THE GLEN.

Bred by us and acknowledged the best and most valuable individual of the breed. Largest herd in America with the best connection. Many cows weighing 1,700 lbs. and above with records of over 10,000 lbs. of milk. Winners at the recent Congress sale owned by us or of our breeding. Sale cattle in carload lots or single. Calf clubs a specialty.

Write T. H. Harrison.
Santa Rosa Stock Farm, Santa Rosa, Cal.
California Representative.

FIVE COWS

Yielded 11.58 lbs.

Butterfat in 24 hours

and 25.65 lbs. of solids, not fat.

These were the Holstein-Friesians that won the Sweepstakes Prize of the Ohio Agricultural Society. The nearest competitor made 10.05 lbs. fat and 14.34 lbs. solids, not fat.

The Holsteins always lead in production.

Stock Raising in WESTERN CANADA

is as profitable as grain growing. Successes as wonderful as those from growing wheat, oats, barley, and flax have been made in raising Horses, Cattle, Sheep and Hogs. Bright, sunny climate, nutritious grasses, good water, enormous fodder crops—these spell success to the farmer and stock raiser. And remember, you can buy on easy terms

Farm Land at \$15 to \$30 An Acre

—land equal to that which through many years has yielded from 20 to 45 bushels of wheat to the acre—grazing land convenient to good grain farms at proportionately low prices. These lands have every rural convenience; good schools, churches, roads, telephones, etc., close to live towns and good markets.

If you want to get back to the farm, or to farm on a larger scale than is possible under your present conditions, investigate what Western Canada has to offer you. For illustrated literature with maps and particulars regarding reduced railroads, rates, location of land, etc., apply to Department of Immigration, Ottawa, Canada, or

3-5 First St., Sheldon Block, San Francisco, Cal.
Canadian Government Agent.

through public opinion bring pressure to bear from without.

Misleading Propaganda.

One of the first attacks against the Association was made by an officer of the State Dairy Bureau, who was also employed by one of the vested interests. Columns of misleading propaganda from his pen found their way into a large number of newspapers. This attack was designed to discourage the dairymen from joining our organization, but it failed. Then at the last Legislative session we were subjected to an investigation which resulted in a clean bill of health. The same sinister interests reached out and secured the arrest of the Association officers at Modesto on the charge of making false returns to the dairymen; again without result. In San Francisco the District Attorney's office was used to indict the directors of our San Francisco unit on the ground of conducting their business in violation of the Anti-Trust law. A jury of consumers in San Francisco rendered a verdict of not guilty. In the Imperial Valley a dozen suits are pending, which will probably be tried only in the newspapers. A short time ago, when we issued bonds to secure funds for erecting plants, all the newspapers representing the vested interests cried to high heaven that here was a move to turn the dairymen over to Wall street. It was a figment of the imagination typical of the unscrupulous attack being waged against us, and designed merely to frighten investors from the purchase of our bonds; but without success.

As a last desperate means to wreck the Association, quo warranto proceedings have been instituted to secure the sanction of the Attorney-General to bring suit for the purpose of dissolving the Association. These proceedings are now pending.

Producers Branded as Criminals.

We have seen in California how the officers of the milk producers were branded as criminals, not for profiteering, but simply for making collective sales. Now let us turn to Chicago. In the fall of 1917 the organized farmers, who supplied the Chicago market, were indicted as having violated the State Anti-Trust law. Shortly after it became necessary for Mr. Herbert Hoover to deal with farm organizations to help solve his great problems, and where farmers were not organized to see that they were. He called the Chicago organization to his assistance. Under the circumstances it would have been very strange to try the producers for acts which were being done under the acquiescence of the Federal Food Administration. So the prosecution was postponed.

In April of this year the Federal District Attorney took a hand. Thirty-five different places in the territory supplying the Chicago market were visited at the same hour by special agents, who subpoenaed local officers to proceed forthwith to Chicago with all books, correspondence, and papers in their possession. I wish I had the time to tell of some of the third degree methods used on these officers when they reached Chicago. You might think it happened in Russia. The city newspapers were full of invective before the trial so that prospective jurors might be fully informed. The jurors were city men—some of them young men of small means with families, who were deeply concerned as to the price of milk. Yet, in spite of the manifest possibilities of bias, the jury brought in a verdict of not guilty. I shall not comment upon this, but I would like to have you characterize it.

Indicted for Making Collective Sales.

Now, let us turn to Ohio. In September the officers of the farmers' milk-selling organization were indicted—not for profiteering, but for making collective sales. Some of these gentlemen were advised of their indictment by telephone in the evening, and because of their high standing in the community, made arrangements with the sheriff to appear in the morning and give bail. This did not suit the District Attorney, who had them dragged from their homes in the

middle of the night and they were thrown into vermin-infested quarters. In the morning they were provided food, which, because of its quality, they could not touch. The District Attorney did not find it convenient to arrange for bail until noon, and while in court a photographer was introduced who took a picture of these dairymen lined up at the prisoners' dock.

These were not bomb-throwers or murderers, but reputable farmers, who were simply accused of combining with other farmers to sell their products.

Let us go on to New York.

In January, 1918, the officers of the farmers' organization were indicted under the Anti-Trust laws. After some legal skirmishes which cost the association fifteen thousand dollars, the New York Legislature amended the laws to permit collective bargaining. Thereupon the District Attorney caused these indictments to be dismissed, stating that the farmers had a clear right under the law to do what they were doing. It was thought that in view of this opinion the organization might continue constructive work in comparative peace. However, the District Attorney has continued to harass the organization. Subpoenas from time to time have been served on the officers, papers and other records have been called for, and there has been a constant investigation going on. Some of the papers called for by the District Attorney were turned over to a New York sensational paper, who printed them in connection with the picture of an emaciated baby, indicating by flaring headlines that the latter was a "victim" of the "milk trust." More attacks are scheduled to develop, not only against producers of dairy products, but against other organized branches of agriculture. Many of these attacks will be camouflaged behind the high-cost-of-living question, but you must not be deceived as to the real intent.

We shall be wise at the beginning to guard ourselves from snap judgment and prejudices. We need to look coolly and thoroughly into the facts of high prices and find out why prices are higher than they used to be. We shall find "profiteering" such as I have pointed out to you, which ought to be, and is corrected by such an Association as ours. If the processes of production are wasteful, the charges of production will be unduly high. The cost of producing manufactured articles is usually fairly ascertainable, but the cost of producing raw material is, in most cases, difficult to establish in this day. Agricultural management has neglected this essential phase. Farmers for the most part have been content with a living and have not "kept books" on cost. Few of them, relatively speaking, know what the elements of the final cost of their productions are.

Loose Talk Against Farmers.

Consumers called upon to pay high prices for agricultural products, the basic necessities of our lives, are a little inclined to talk loosely about rich farmers and complain against assumed profiteering by the producer. There is one thing the consumer can never afford to do, and that is to favor measures or conditions which do not encourage and reward production. Every ounce of encouragement by the consumer to the producer comes back to him in pounds, not ounces. Low prices, when they strike at the margin of profit of the producer, most certainly injure the consumer, because they reduce production and eventually restore high prices by creating scarcity.

A Fair Profit Indispensable.

There are three things absolutely essential to the future of this important industry, namely, a realization on the part of the consuming public that the future welfare of this nation depends upon the development of the dairy cow, and that she cannot be conserved and developed unless it is possible for the farmer to care for and maintain her at a fair profit. In any ordinary business, those engaged in it are expected to educate the public as to things they have for sale and their uses. It is quite different with the

products of the dairy cow. Every individual is interested in his or her health and welfare and should be seeking all information as to the kind of foods which will best equip them for life's effort. For this reason, every person should interest himself in learning of the vital qualities of milk and its products, and of those things necessary to be done to maintain and develop the dairy cow.

The owners of the cows need a clearer understanding of the importance which the animals they own bear to human welfare, and a fuller

realization of the fact that in caring for and developing the dairy cow, they are engaged in a business, the importance of which cannot be over-estimated.

[The above very able defense of the co-operative movement among the dairymen of California and the United States is published almost complete. Great care was taken to leave out nothing that would detract from the force and truth of the argument. It should be read carefully by all those interested in milk from any viewpoint whatsoever.—Live Stock Editor.]

Would a Bigger Milk Check Be Acceptable?

All you need do is to pay closer attention to cow health. A big milk yield is a genuine health certificate; if the quantity falls off the chances are the cow is suffering from some impairment of her digestive or genital organs—the starting point of nearly all cow ailments.

This Holstein holds the **WORLD'S BUTTER RECORD**, 1504 lbs. butter in a year. Perfect health made her record possible.

KOW-KURE is a cow medicine designed to act directly on these vital organs. There is nothing "just as good" for the treatment or prevention of Abortion, Barrenness, Retained Afterbirth, Scouring, Bunches and Milk Fever. For more than a quarter-century it has been used in the most successful dairies. Feed dealers and druggists sell **KOW-KURE**—in 60c and \$1.20 packages. Send for free treatise.

"THE HOME COW DOCTOR."

It gives full instructions on treating cow diseases—should be in every farm library.

ALLANA HOLSTEIN FARM.

This fine farm, situated 12 miles north of Fresno on the main highway to the Yosemite Valley, consists of 520 acres of the finest land in this Eden of the world. A large acreage is devoted to raising table and raisin grapes. Besides the grapes, there is

Friesian female at California International, 1919. Owned by J. P. Phillips, Fresno, Calif. Josephine Jehanna Oak De Kol, junior champion and reserve grand champion Holstein-

alfalfa galore, and a herd of Holstein-Friesians of the best-producing blood lines to eat it. J. P. Phillips, owner of the property that anyone would be glad to have, is developing one of the great herds of his favorite breed of dairy cattle. His senior herd sire is Sir Pieterje Korndyke Ormsby, son of the noted sire, Sir Pieterje Ormsby Mercedes. With cattle of the best, feed in plenty, and withal the ability to select winners, it is no hard task to see a brilliant future for this great herd.

DAIRY INTERESTS IN SESSION.

(Written for Pacific Rural Press.)

The California Butter, Cheese and Ice Cream Makers' Association held their 1919 Convention at the University Farm, Davis, on November 20.

The Buttermakers' Competitive Butter Judging Contest was won by A. R. Wickham, University Farm, Davis. Mr. George Dondero of the Petaluma Co-operative Creamery won second honors in this contest. After the judging contest, Mr. T. J. Harris of the San Francisco Dairy Produce Exchange, called the buttermakers' attention to certain common defects in butter, his contention being that a large amount of butter lacking in color, is received on the market at this time of the year. Mr. G. E. Frevert of the U. S. Dairy Division, also addressed the meeting, calling special attention to the value which can be obtained from Educational Butter Judging Contests.

At the business session it was agreed to establish a requirement for membership, which would eventually result in developing a better spirit among the men in the plant and their managers. It was also agreed upon to use the dairy papers of the State to advantage in discussing the affairs and progress of the Association.

The dairy supply representatives and milk inspectors present at the meeting responded favorably when they were called upon to assist the Association in a membership campaign planned for the coming year. The following officers were elected: Thomas C. Moran, Oakdale, President; J. M. Jensen, Hanford, Vice-President; Wm. Dreyer, Sacramento, 2nd Vice-President; J. C. Marquardt, Davis, Secretary-Treasurer.

SHORT SALE OF SHORTHORNS.

Last call for this great sale of Nevada bred Shorthorns. Here will be a chance for those intending to get into the purebred game to get some excellent stock at their own prices. Purebreds pay, and these are some that have not been pampered, but are ready to go right to work without any tedious "letting down" process. Col. Ord L. Leachman will cry the sale.

The American Jersey Cattle Club by the recent action of the Board of Directors, has eliminated the seven-day test. This test has fallen into disuse in late years, and the directors thought best to strike it out of the rules entirely.

The Famous TAGUS RANCH Tulare Calif.

MERRITT-BOWERS COMPANY

2-Day Sale TUESDAY, WEDNESDAY, **December 16-17**
OFFERS AN OPPORTUNITY NO STOCKMAN OR FARMER CAN AFFORD TO MISS

The Shorthorns

101 in number, are the largest lot of animals of superior breeding ever offered in a single Shorthorn sale in California. The 58 beef cows and heifers, most of them bred and many selling with calf at side, are a fine lot of matrons by Scotch and Scotch-topped bulls. Many are by Knight Avon 2nd, the great Curtiss bred bull by the Carpenter & Ross bull Comet by Avondale and he by Whitehall Sultan, which is quite enough to say of a Shorthorn. Some of the cows are in calf to Knight Avon 2nd, and others by some of his outstanding sons.

Knight Avon's sons of breeding age are numerous in the offering and frequently in the catalog will be found sons and daughters of Coronado, by Golden Goods, the last of the great sires combining the direct blood of the St. Louis World's Fair Champion, Young Abbotsburn and Choice Goods. A worthy son of Coronado transmitted more of his blood through the herd and is bred to daughters of Arizona Archer, by Victorious Archer by Golden Lord, a member of the strikingly handsome Golden Drops section of the Linwood herd. Knight Avon 2nd was used quite extensively on the daughters of Coronado.

The 25 bulls in the offering are good rugged sires, bred and raised in the open and ready for the range or breeder's lot.

The 13 MILKING SHORTHORNS are a shapely lot of well-developed dual-purpose cows, and for the most part are bred along lines that will give the greatest production of valuable products for which the Shorthorn is noted—meat and milk. Glensides Sequel of the famous Glensides breeding, has seen service in the herd and is the sire of the half-dozen fine, vigorous young bulls that should prove an attraction where milk-strain Shorthorns are in demand.

The Shorthorn offering, presented in good rugged range condition, without the usual sale ring preparation, will give the buyer more for his dollar than had the herd been pampered and fitted for the auction.

The good regular breeders of such excellent blood lines and tuberculin tested should make the most inviting Shorthorn offering of the year, and the large number selling is bound to have the bargain spots.

The Shorthorns will go through the ring commencing 9:30 o'clock Wednesday, December 17th.

The Herefords

The 30 two-year-old Hereford bulls are as nice a lot as was ever offered in a bull sale of either registered or unregistered purebreds. They are the tops of a large purebred herd that has been permitted to run on the range without the keeping up of individual breeding records, so they will sell unregistered, ready for the range. The ruggedness, size and vigor of the lot commends them to the buyers who want a better crop of calves by bulls that have been bred right and raised under conditions which will permit their being turned out on the range to prove their worth. They sell Wednesday, December 17th.

The Work Horses

No ranch can boast of a better lot of good work horses than this one, and the 30 head that are offered are ready to get into the collar for any kind of work. They sell Tuesday, December 16th.

The Unbroken Horses

The 25 unbroken horses are for the greater part saddle stock, being a nice trim lot of young horses not to be overlooked. They also sell Tuesday, December 16th.

The Wagons and Harness

The 25 big wagons are in good-as-new condition and with the 20 sets of first-class harness will make a feature of the sale well worth figuring on even if interested in nothing else. They sell Tuesday morning, December 16th, and will go fast.

THE IMPLEMENTS

Tagus Ranch is noted for its modern equipment and the manner in which it maintains its farm and field machinery is an example for other ranches of the country. Much of the great 6000-acre ranch is being leased, so there is offered an assortment of implements too numerous to mention. Plows of all descriptions, subsoilers, grain and alfalfa drills, and hundreds of useful and expensive tools that have seen but slight service, will go to the highest bidder.

THE IMPLEMENTS WILL START THE GREAT 2-DAY SALE, COMMENCING 9:30 O'CLOCK, TUESDAY MORNING, DECEMBER 16, 1919

**IMPLEMENTS, WAGONS, HARNESS,
HORSES, JACKS, MULES
SELL**

TUESDAY, DECEMBER 16th

**100 — SHORTHORNS — 100
30 — HEREFORDS — 30
SELL**

WEDNESDAY, DECEMBER 17th

The Tagus Ranch is one of the Great Farms of the country. Its stock and equipment are in keeping with its good reputation. Come for both days. You will find what you want and get it at your own price. The ranch is on the highway 5 miles north of Tulare.

For catalog and further information, apply

MERRITT-BOWERS COMPANY, or
Tagus Ranch,
Tulare California.

ORD L. LEACHMAN,
Auctioneer and Sales Manager,
1111 Seventh Street, Sacramento, Cal.

The Draft Horses

The horse offering has never been surpassed for a finer lot of registered and unregistered stock than has been put up to the highest bidders at this sale.

Percherons

Superior, 97190, the big steel-gray 7-year-old stallion by Restaurant, an imported stud, and out of Black Bess, is the kind badly needed in many communities of the country today.

Woodland, 141084, the gray 3-year-old by Nero, 1211061, and out of Comet, 74004, is one of the promising young stallions of the Pacific Coast.

Inquiet, 69564 (79239), the big black imported stallion by Aiglon (64052) and out of Castile (61344) is one of the kind seldom, if ever, found at public sales.

Patre of Paicines, 111450, a gray 5-year-old stallion by Fernand, 72763 (65262), and out of Pink Timber, 46040, is a real horse through and through.

A gray 2-year-old stallion rounds out the Percheron offering, the likes of which has rarely been sent through the sale ring.

Shires

General Sherman, 18042, a black 4-year-old stallion by Rolleston Wonder, 7931 (22730), and out of March Queenie, 10517 (58913), both imported stock, could stand anywhere in the country.

March Coronation (12959), an imported 7-year-old stallion, is a beauty, size and quality unexcelled.

Goodacre Gem, 15949, a 6-year-old bay mare by Nateby Statesman, 8510 (23539), and out of Horbling Gem, 10519 (58916), is a fine brood animal of the best of imported mating.

Wrydelanes Model, 105454 (58883), a brown mare by Warden Royal Harold (16300) by Harold (3703) and out of Norbury Sylph (48883) was imported in 1909 as a filly, and comes from the best Shire blood in England.

Belgians

Dewey, a roan 2-year-old stallion by Cesar d'Olsene, 3924 (51518), and out of Diana, 1426 (67045), combines the blood of two of the greatest imported horses ever brought West and his big muscular body and heavy frame would be difficult to equal.

A nice, big Belgian stallion colt also goes into the ring for what buyers consider him worth.

Margot de Waere, 68659, a black imported mare by Martin de Cappelle (41336), and out of Marie de Waere, is one of the choice mare offerings.

Mina (1370), a 2000-pound imported roan mare, is of rare quality and substance.

A roan imported mare of 2000 pounds, on which the owners cannot secure papers, would not be up for sale under any other circumstances.

German Coach Horse

Raven, 5945, a 7-year-old stallion by Latus, 5289, out of Dura, 312, is a horse worthy of his breed. These sell Tuesday, December 16th.

The Jacks

Five of the biggest-boned kind of Jacks that get those big useful mules, are to be sold under the hammer on Tuesday, December 16th, making an attraction of the sale that is of unequalled offering anywhere in the country.

The Mules

The 25 mules are fine, big, good pullers, heavy in demand throughout the land today, and buyers will find the kind to their liking in this bunch. They sell Tuesday, December 16th.

Butchering Hogs and Curing the Meat

(Written for Pacific Rural Press by Thos. F. McConnell.)

Several inquiries about home curing of hams and bacon makes it appear that there is more or less interest among farmers on this subject at this time of the year. Where the farmer or rancher has a number of hogs to kill, it is possible for him to hire some one to assist on "hog killing day," as it used to be termed in the states east of the Mississippi river. Fifty years ago it was looked upon as a sort of holiday by the children on the farm in the northern states, and according to an old negro mentioned in an account of plantation operations in one of the southern states, "hog-killing day" stood out as the most delectable period of the year. He said, in talking about it, "Dese yere udder niggers may hab deir water millions, deir 'possums, and 'coons, but hawg-killin' day is de supremest time of all." Be that as it may nearly every one is fond of properly cured hams and bacon, sausage, and head cheese, and it is the aim in this article to assist those who wish to cure their own meat.

It is necessary in order to have the best-cured meat, to have the best hogs to kill. No particular breed is meant when we say the best. What is best in this case is a hog, either sow or barrow, from 6 to 8 months old, and weighing from 200 to 225 pounds. If you have an animal a year old, the lean meat will not be as juicy and tender, either fresh or when cured.

If a large proportion of lean meat is desired, do not feed your hogs like the Irishman who wanted "a strake of fat and a strake of lane mate," and fed excessively one day and starved 'em the next. It has been demonstrated years ago by no less an authority than Professor W. A. Henry of the Wisconsin College of Agriculture, that it is easy to produce a hog carcass having a large percentage of lean meat by feeding a narrow ration and plenty of mineral matter. That is, give plenty of alfalfa pasture, a reasonable amount of tankage or skim milk along with the barley, Egyptian corn, milo maize, or Indian corn. Wood ashes are excellent to supply mineral matter, and are relished by hogs that are on full grain feed.

Tools Needed.

When the hogs are considered fat enough, then if there are any weather prophets in the family, select the first of two or three cool, frosty days in succession for "hog-killing day," as it is very necessary to have the meat thoroughly cooled before placing in the pickle. Plenty of sharp knives, gambrels for hanging the hogs after scraping, scrapers for removing the hair, platform on which to lay the hogs while scraping off the hair, and a barrel or cask in which to scald them to loosen the hair.

Kill by stunning with a blow from an ax, or shooting with a small calibre rifle, and "sticking" immediately afterward so that the animal is bled well. If the animal is completely stunned the bleeding is painless, and the animal suffers not at all.

Scalding and Scraping.

A fifty-gallon barrel is large enough to scald a 200 to 300 pound hog, scalding one end or half the hog at a time. The water should not be hotter than 175 degrees Fahrenheit to begin with, and should not be allowed to fall below 155 degrees. The animal should be kept moving all the time while in the water to prevent cooking the flesh. It will take from a minute to a minute and a half to loosen the hair so that it can be removed quickly and completely. The hind end is generally scalded first, and the hog is handled by insert a hay hook or similar, but larger and heavier implement, in the under jaw. Just as soon as the hair will slip off easily, remove the hog from the barrel to the platform provided for the purpose. Work rapidly now just as though you were fighting fire. Remove the hair from the feet first, as they are the most difficult to clean. If a "good scald" was obtained all the hair will come off except that in the wrinkles of the

legs which will have to be shaved off with a sharp knife, being careful not to cut the skin at the same time. As soon as this end is scraped, see that the water in the barrel is hot enough, testing with a dairy thermometer (don't guess) and scald the head and fore legs and the part of body still remaining. Handle the carcass by a gambrel (a strong stick, sharp at both ends, about 2 feet long and slightly bent), inserted under the tendons on the back part of the hind legs, just above the hoofs. After all the hair has been removed by scraping that can be, rinse the animal with water from the scalding barrel, and shave off the few bristles remaining with sharp knives, cleaning the feet and head carefully of all scurf and hair.

Dressing the Carcass.

Hang the carcass up by the hind legs with the gambrel mentioned above, just high enough to clear the nose from the ground. Rinse again with clean water, and shave with sharp knives, so all dirt and few hairs left will all be removed. If the work has been properly done, even the blackest of hogs will look clean and white. Remove the intestines first, being very careful not to cut or break them. Now carefully remove all fat from them as on a fat hog there is considerable lard to be saved from them if carefully and cleanly done. Then the heart, lungs, liver, and tongue should be taken out. The only thing to avoid here is breaking the gall bladder, which should be removed from the liver carefully after the liver is removed from the carcass. The carcass is now open, and should be rinsed out thoroughly with clean, cold water, first placing a small stick or corn cob between the jaws so that all bloody water will drain out. Place a stick in the flanks to hold the carcass open so that it will cool quickly.

Cutting Up the Carcass.

The old rule in "years gone by," particularly in the colder climates, was to allow the carcass to cool thoroughly before cutting it up. Many claimed it was not possible to make good cured pork from it unless this was done. In California, and especially in the warmer parts where no artificial cooling means are available, it is better to cut the carcass up as soon as possible, placing the hams, shoulders, and bacon strips on clean boards, skin side down, in the coolest place on the ranch. Cut all bacon pieces as true and square cornered as it is possible to make them, and when placed out for cooling, lay them straight and square so that they will not be all twisted and crooked when cool.

When cutting up the hams for brine pickling, it is better to cut the legs off close up to the ham or shoulder, making what is known as a short ham. The hoofs should be cut off the feet at the same time, care being taken to not cut the feet any shorter than is absolutely necessary, as those who like pickled pigs' feet like all that they can get. All loose, flabby portions like the belly should be put with the leaf lard or "kidney fat" as it is sometimes called, cutting out all the lean portions to make into sausage.

After the meat has cooled thoroughly, go over all the hams, shoulders, and pieces of bacon, trimming off all ragged edges and corners, giving the hams and shoulders a neat, smooth appearance. All that is trimmed off can go into the sausage, or if too fat into the lard.

Sausage.

Genuine pork sausage, properly cut and seasoned, is a delicacy seldom obtained except on the farm or ranch. Judging by appearance the fat and lean should be about equal with the lean part being the larger if any difference is made. All skin should be removed, and the meat cut into pieces convenient for feeding into the grinder or cutter. Cut it fine rather than coarse, and under no circumstances put in any meat other than fresh pork. After you have the sausage meat ready for cutting, weigh

The Chester White Will Start You Right

Large litters, easy feeders, quick developers, low shrinkage in slaughter, premium carcasses—these are a few of the features of the Chester White, the profit-making hog.

Our last carload shipment dressed 72.30 per cent and brought 1½¢ above the market price.

Largest Herd on the Coast

Over 100 mammoth brood sows, headed by **HIGHLANDER**, the \$1,000 Grand Champion boar, whose sire and dam were both undefeated Grand Champions at three International shows. His pigs are corks—the kind you want.

ORDER NOW—AVOID DISAPPOINTMENT

The demand is keen. Get your order in early. We have a wonderful lot of tried sows, open and bred gilts, service boars and weaned pigs, representing the finest blood lines in America. Prices reasonable. Write us your wants.

THE GARDINER RANCH

ROUTE 4, BOX 735,

SACRAMENTO, CAL.

it, and to each 5 pounds of meat add 1½ ozs. salt, ½ oz. ground black pepper, and ½ to ¾ oz. ground sage. It probably will be necessary to grind the meat twice in order to thoroughly mix the meat and seasoning, and to get it fine enough to suit most tastes.

To keep after making, it may be cooked at once, making it into balls ¾ inch thick and 2 inches in diameter, placing them after cooking in clean crocks, and covering with melted lard, or it may be partially cooked, stuffed into muslin sacks about 3 inches in diameter, dipped into hot lard, smoked and hung up in a cool place. The first method is the safest in California climates.

Pickling the Hams and Bacon.

There are various methods of pickling hams and bacon, but only the brine pickling will be noticed here, as experience has shown that more people are successful with it than otherwise, and if detail of the work is looked after success will follow.

The first thing to be done is to get a proper receptacle in which to pickle the meat. It must be clean and free from taint of any kind. For small amounts of meat a 20-gallon earthenware crock is an ideal receptacle, as it can be made perfectly clean, is absolutely free from taint, and will not leak. A clean oak barrel that is absolutely tight and has been soaked long enough to free it from the wood taste, is all right. Wooden hoops are best, although iron hoops will answer, but iron tends to rust, and in about the third or fourth year a hoop will part, the barrel start to leak, and before it is discovered, the meat is spoiled.

Therefore, have the right kind of barrel or crock.

The Brine or Pickle.

There are many formulas for making the pickle, but they really are much alike, and the base of all is salt. The sugar in most of them adds a flavor desired, and is somewhat of a preservative. The saltpeter preserves the red color so much desired. Saleratus is added sometimes to keep down fermentation, and eliminate ropiness in the brine.

A formula given in "Southern Pork Production," by Prof. P. V. Ewing, of the Texas College of Agriculture, is perhaps as well adapted to California conditions as any. We give it below.

For every 100 lbs. of meat, 8 lbs. of clean rock salt, 2½ lbs. sugar, 1 quart sugar cane molasses, 2 ounces baking soda (saleratus), 1½ ounces saltpeter, dissolved in 5 gallons of soft water. Put in a kettle or other vessel, and bring to a boil, skimming until clear. Place hams and bacon in the receptacle, placing a weight on them so that they cannot float in the brine. When the brine is cool, pour over the meat, being sure that all is covered.

In the above formula the molasses may be omitted, but many prefer the meat with it in. The recipe calls for soft water, but tons of meat have been cured successfully with hard water. Watch the meat to see if there are any signs of fermentation shown by froth on top of pickle or ropiness in the brine. In warm weather this may occur. If it does show, either the brine must be boiled or new brine made. Six weeks is about the right length of time to keep the meat in the brine, although very large hams and shoulders may be left in a week or two longer.

Smoking.

If the meat is to be smoked, it should now be taken out of the brine, and hung up in the smoke house, and allowed to drain a day or two before commencing to smoke it. Care must be taken to prevent flies from depositing eggs and worms developing. Smoke with apple, prune, or apricot wood, or corncobs, avoiding all pitchy resinous woods. The amount of smoking depends on the taste. Judge by the outside appearance or by cooking and eating some of the meat.

In the colder climates the meat may hang in the smoke house until warm weather, but in the Southwest it should be taken down and, according to Prof. Ewing, before quoted, painted with a mixture of molasses 9 parts, ground black pepper 1 part. Then wrap closely in heavy wrapping paper after which it should be placed in a heavy muslin or paper sack, tying so that no insect can possibly gain entrance. Now the package should be completely and thoroughly covered with a mixture of 50 parts powdered barytes, 1 part each of glue and lead chromate, and 5 parts flour. Make the flour into a thin paste with water, then add the dissolved glue and chromate, and finally adding the powdered barytes. The different pieces should now be hung in a cool, dark place and so that they do not touch.

If the above directions are followed, sweet, nicely flavored meat will be the result that is better than any you can buy.

DO YOU WANT TO BUY POLAND-CHINAS?

If you do, W. T. Dice, of Hanford, who is well-known up and down the Pacific Coast as the breeder of "Right type" Poland-Chinas, will leave for the corn belt not later than December 15th. He expects to be gone for 6 or 8 weeks, and will attend all the important auction sales of his favorite breed during that time, and visit many of the prominent breeding establishments of Poland-Chinas. He has accepted commissions from a large number of breeders to buy Polands, and would be glad to receive a few more. Those who know Mr. Dice are glad to avail themselves of the opportunity, and know that any commissions placed in his hands will be executed with honesty and ability.

All carloads of fat steers on exhibition at the California International were Herefords. Where were the other beef breeds?

PURE HAWAIIAN CANE MOLASSES

PORK PRODUCTION

By actual test will increase pork production five-tenths pounds daily over a barley and tankage feed, yet it sells for less than half the price.

MILK PRODUCTION

One of our customers writes: "We are out of molasses and our cows are falling off in their milk badly, hence we would appreciate immediate shipment. Kindly ship us two tons more in addition."

We supply it in barrels or tank cars for shipment anywhere.

Livestock and Dairy Notes

Dairy.

The highest 7-day record of the year comes from the herd of Alex Whaley, Holstein-Friesian breeder of Tulare, whose 4-year-old cow, Eldorado Winifred, produced 24.174 lbs. butter fat, and 637.6 lbs. milk for the period. The average per cent fat was 3.79.

The cost of pasteurized milk soared recently in Stockton two cents. Wagons delivering from door to door are now selling at 8 cents a pint and 14 cents a quart. There has been no advance in the cost of raw milk to the trade. The stores report a similar increase to the counter patrons, also.

In some way our "wires got crossed" in reporting Ayrshire awards at the California International, and E. B. McFarland was credited with winning first prize on four animals of either sex, get of one sire, when this award was made to cattle owned by J. Henry Meyer, proprietor of Elkhorn Farm and breeder of blue-ribbon Ayrshires.

The Western Berkshire Congress has presented Owen Duffy, business manager of the Napa State Hospital, with a silver trophy as an appreciation of the service that Mr. Duffy has rendered the Berkshire breed in sending a car-load of Berkshire hogs to the California International good enough to win the grand championship in car-loads of fat swine.

Thirteen thousand official year's records have been completed by Jerseys. No other breed can show as many completed year's records. The average production of these records is 7932 lbs. milk, and 424 lbs. fat. This includes cows of all ages from yearlings to animal 17, 18, and 19 years old. The average production of 4500 aged Jerseys, cows 5 years old and over, is 9218 lbs. milk, and 487 lbs. fat.

Swine.

The calendar of fat hog sales by the California Farm Bureau Marketing Association throughout the San Joaquin valley for the month of December was announced from the office of the farm advisor. The dates follow: December 6, Wasco; December 9, Tulare; December 10, Visalia; December 11, Chowchilla; December 12, Turlock; December 13, McFarland; December 15, Modesto; December 16, Merced; December 17, Hanford; December 18, Corcoran; December 19, Fresno; December 20, Bakersfield; December 22, Madera; December 23, Tulare; December 24, Visalia.

"Pure Bred Squeals" is the title of the latest livestock publication to find its way to our desk. It is published by the Kern County Union High School Agricultural Club, and is a very creditable publication. It is very fashionable, as it is like some of the New York magazines; it is beating the H. C. of L. by eliminating the printer. The paper is published for the purpose of keeping the public informed about the progress of the Purebred Litter Contest, and other seasonable data relative to the purebred livestock business in general. The first issue gives a list of the boys who have bought gilts, and entered them in the contest, giving the name of the breeder from whom the gilt was purchased, and its weight. They certainly have patronized a reliable bunch of breeders in the purchase of their stock.

Beer.

Caledonia Farms of San Francisco and Sacramento report recent sales and shipment of Shorthorns as follows: 4 heifers and 3 bulls to Carson City, Nevada; 5 bulls to Red Bluff; and 9 bulls to Montague.

The Lazy H. Ranch of Sanger has recently imported 64 bulls and 26 heifers from the Noah B. Matkins Ranch of Kansas. The cattle are all purebred Herefords, and the management intends to gradually replace

Holsteins and some other breeds that have formerly been bred on their holdings.

The sale of Nevada bred Shorthorns, owned by W. C. Short of Reno, will take place at the State Fair Grounds, Sacramento, Thursday, December 11th. This stock is all young and well bred, and will afford California breeders an opportunity to buy some excellent stock.

The weekly report of the Bureau of Markets, U. S. D. A., of November 20th, says "the Brazilian Government realizes the necessity for improving the quality of Brazilian cattle. In the Chamber of Deputies at Rio Janeiro, the Minister of Agriculture, in sub-

mitting the estimates for his department for next year, estimated that there are 30 million head of cattle in Brazil at the present time, including 20 million head of females of which 12 million head are ready to breed. For the proper crossing of these herds the Minister stated that it will be necessary to import 120,000 bulls during the next ten years, or an average of 12,000 bulls annually, and he therefore requested an increase of the appropriation for this purpose from \$364,987 to \$3,649,875." Now that we have the Panama Canal it would seem as though the Pacific Coast ought to be able to get some of this money.

The government has issued a special circular warning farmers against feeding carcasses of animals dying from disease. It is safer to burn all such carcasses, or bury them deeply, covering with quicklime. Carcasses of animals dying of anthrax, glanders,

BOOK ON DOG DISEASES And How to Feed

Mailed free to any address by
the Author

H. CLAY GLOVER CO., Inc.,
118 West 31st Street, New York

and tuberculosis should always be completely burned.

C. R. Thomas, manager of the Los Angeles Livestock Show, expects to make a trip to the Central States early next year to buy two carloads at least of purebred Shorthorns and Herefords for the Southern California breeders.

Sheep.

In the report of the Pacific International last week, the winnings in the Hampshire sheep classes by C. Harold Hopkins, of Woodland, were omitted. First on ram lamb, and grand champion ram of the Hampshire breed went to his credit in strong competition. Mr. Hopkins is manager of the Conaway Ranch at Woodland, where they are doing things in the purebred livestock business. They are just starting a flock of Hampshires, but judging from their winnings, they have started right.

At the wool auction sales in London December 1, 11,890 bales were offered. The market was active and prices firm. America bought merinos which were 5 per cent dearer. Cross-breeds were unchanged except shabby coarse, which were 5 per cent cheaper. Melbourne greasy merinos fetched from 7 shillings 3 pence to 7 shillings 8½ pence.

Miscellaneous.

Rodent control has produced excellent results in the Sitgreaves National Forest of Arizona, according to the Extension Department of the Arizona College of Agriculture. The gramma grass is kneedeep on thousands of acres that were formerly devastated by prairie dogs. We have no prairie dogs, but we have gophers and squirrels that are just as hungry as the dogs. Feed 'em poison next summer.

The U. S. Forest Service some time ago proposed a stock road to parallel the Lincoln Highway between the Shingle Springs and Summit, but the cattlemen of that region at a recent meeting opposed such a move. The expense was to be taken care of by the Forest Service and was intended to accommodate both the automobile tourists and the cattlemen. To the uninitiated this would seem a safe and sane idea.

TAGUS RANCH SALE.

Having fixed a policy to hold two great livestock and farm auction sales a year, the Merritt-Bowers Company, operating the famous Tagus Ranch at Tulare, has decided upon Tuesday and Wednesday, December 16th and 17th, as the dates for 1919 fall sale.

One hundred registered Shorthorns, many of them sired by or in calf to Knight Avon 2nd, son of Count Avon by Avondale by Whitehall Sultan, some of the greatest sires of the breed, are an attraction that will bring breeders and range men from all over the west. In the lot are a number of Milking Shorthorns.

Thirty unregistered Hereford Bulls that go into the sale are a fine lot of two-year-olds.

The Merritt-Bowers Company is providing a further attraction by putting in fifteen head of high class registered Percheron, Belgian and Shire stallions and mares, as well as five head of registered jacks. The horse offering will also include twenty-five mules and thirty work horses.

Col. Ord L. Leachman of Sacramento will cry the sale.

WAUKEEN HERD POLAND-CHINAS—Big type herd boars, the \$700 Grand Champion of California. Lee McCracken, Prop., Ripon, Cal.

REAOAKS RANCH herd of registered Poland-Chinas. W. J. Hanna, Gilroy, Calif.

BIG-BONED POLAND-CHINAS—Stock for sale. E. S. Myers, Riverdale, California.

Duroc-Jerseys.

"MAY ROSE" DUROCS are the classicst pigs in the West. Take a look at them—seeing is believing. Our junior boars have been first and champion at both the California State Fairs and the Los Angeles Show—nothing better. We have a few dandy boar pigs by them out of our great "May Rose" sows ready for sale. Grab one, if you want the real thing. Cokers, not plugs. Also booking limited number of outside services for champion boar May Rose King. The cheapest way to get his blood, but only a few more sows will be accepted. Elliott-Brant Rancho, Owensmouth, Cal.

FOR SALE—Two Spring boars by 1918 Grand Champion of Missouri, High Orion (221329), dam by Pathfinder, a good one. One fall boar by Grand Model's Type (244719), dam Col. bred. Midvale Farms Corp., Ethnace, Cal.

RANCHO RUBIO DUROCS—Two boar pigs, four months old and weaned pigs, both sexes. Stock of Orion Cherry King Pathfinder and Golden Model breeding. Sold on "Money Back" guarantee. Elmer Lamb, Ceres, Calif.

DUROC-JERSEYS AT IRELAND—Sows sired by Cherry Volunteer 2nd and Reformer, bred to Ireland Joe Orion at public sale, January 30, 1920. Write for catalogue, 1219 Brockman Bldg., Los Angeles, California.

SWEETWATER DUROCS—The most popular herd in the West. Our Durocs make money for us—they will do the same for you. Address R. K. Walker, Winsor Ranch, Bonita, San Diego Co.

BIG-TYPE DUROCS—Herd headed by California Orion King. Am offering excellent young boars at right prices. Inquiries invited. Harvey M. Berglund, Dixon, Calif.

REGISTERED DUROC-JERSEYS—Weanlings, both sexes, from Orion, Defender and Golden Model stock. Address H. C. Baum, Pino Vista Ranch, Placerville, Cal.

DUROCS—MATURE BOAR—Bred by University Farm, Davis. Solely on account of needing change of blood. Weanlings, either sex. H. E. Boudier, Napa.

WEANLINGS—Gilts open or bred to a son of Great Wonder I Am. Service boars. Derryfield Farm, Capital National Bank Bldg., Sacramento.

DUROC-JERSEYS—Fine big type gilts, tried sows and boars Eastern and California bred. H. P. Slocum & Son, Willows, Calif.

HEAVY-BONED DUROCS—A few service boars for sale. Ormondale Co., Route 1, Redwood City, California.

BIG-TYPE DUROCS—Gilts and boars of Orion Giant breeding. Falfadale Farms, Peris, Calif.

REGISTERED DUROCS—Stock for sale. W. J. Fulgham & Sons, Visalia, California.

A FEW A-1 MARCH BOARS—Jack London Ranch, Glen Ellen, Sonoma Co., Calif.

REGISTERED DUROCS—All from prize-winning stock. W. P. Harkey, Gridley, Calif.

Chester Whites.

BILLIKEN CHESTER WHITES—Entire herd for sale. Every animal is listed and priced for immediate movement. Herd boars; young service boars. Bred sows. Seven litters of fall pigs, by four different sires. Write for special price list. C. B. Cunningham, Mills, Cal.

Hampshires.

REGISTERED HAMPSHIRE—"Belted Beauties." Weaned pigs a specialty. Unedda Hampshire Swine Farms, Gardena, Cal.

DAIRY CATTLE.

Jerseys.

SERVICE JERSEY BULL, bull calves, Financial King blood, Chester white boars, prize winners. Best blood, type, production. N. H. Locke Co., Lockeford, Cal.

SUNSHINE FARM JERSEYS—Tuberculin tested. Production counts. E. E. Greenough, Merced, California.

Holsteins.

THE LEWIS COMPANY BAYWOOD HERD OF REGISTERED HOLSTEINS

Herd sire Ormsby Segis Marie Lad, whose dam has produced in two years, beginning as a three-year-old, 57481 lbs. of milk and 2243 lbs. of butter.

First National Bank Bldg., San Jose, Cal.

REGISTERED HOLSTEINS for sale. Seven bred cows, one Pontiac bull, 5 years old; also two heifer calves. Subject to registry. Wm. M. Little, Box 76, Snelling, Cal.

YOUNG HOLSTEIN BULLS—Excellent breeding and individuals. Satisfaction guaranteed. Pecho Ranch and Stock Co., San Luis Obispo, Calif.

THE VICTORY HERD—Registered Holstein cattle and Duroc Jersey swine. H. E. Spires, Hillcrest Farms, Caruthers, California.

A FEW YEARLING registered bulls by King Morco Alcartra 2nd, from good producing cows. H. M. Cross, Merced, Cal.

PAJO ALTO STOCK FARM, Palo Alto, breeders of registered Holsteins. Heifers and service bulls. Reasonable prices.

EL DORADO HERD OF HOLSTEINS—Alex. Whaley, Tulare, California.

REGISTERED HOLSTEIN CATTLE—E. B. Freeman, R. B., Modesto, Cal.

REGISTERED HOLSTEIN—Best blood lines of the breed. R. L. Holmes, Modesto, Cal.

CREAMCUP HERD—Register Holsteins. Pontiac bull calves. M. Holdridge, Rt. A, Box 437, San Jose, California.

REGISTERED HOLSTEINS—A. W. Morris & Sons Corp. Importers and Breeders, Woodland, California.

F. H. STENZEL, SAN LORENZO, CALIF.—Breeder of Registered Holsteins. High test producers.

REGISTERED HOLSTEIN BULLS with world's record backing. Kounias' Registered Stock Farm, Modesto, California.

REGISTERED HOLSTEINS and Duroc-Jerseys. Sturgeon Stock Ranch, Tulare, Calif.

REGISTERED HOLSTEINS—Best blood production. Leeman and Kilgore, Ripon, Cal.

J. W. BENNETT, Modesto, Calif.—Breeder of registered Holsteins.

GOTSHALL & MAGRUDER—Breeders of registered Holstein-Friesians. Ripon, Calif.

CHOICE HOLSTEIN bulls for sale. No females. Millbrae Dairy, Millbrae, California.

Ayrshires.

ELKHORN FARM AYRSHIRES—Choice young bulls at reasonable prices. J. H. Meyer, 440 Montgomery St., San Francisco, Calif.

AYRSHIRES—Registered; all ages. E. B. McFarland, 412 Claus Spreckels Building, San Francisco, California.

NORABEL FARM AYRSHIRES—Le Baron Estate Co., Valley Ford, Cal.

Guernseys.

EDGEMOOR FARM GUERNSEYS—First in the show ring and in official records. A few choice bred bull calves for sale. Edgemoor Farm, Santee, San Diego county, Calif.

BELLA VISTA GUERNSEYS—May Rose Governor of Chene breeding. Bull calves from high record dams. J. W. Gemmer, Ripon, Cal. R. 2.

Milking Shorthorns.

BREEDERS OF REGISTERED SHORTHORNS—Milk strain; choice young stock for sale. John Lynch Ranch, Box 321, Petaluma.

INNISFAIR DAIRY SHORTHORNS—Registered young bulls for sale. Alexander & Kellogg, Suisun, California.

DUAL-PURPOSE SHORTHORNS—registered and unregistered bulls. Chas. L. Weaver, Tulare, Calif.

BEEF CATTLE.

RANCHO SAN JULIAN SHORTHORNS—Purebred range bulls, unregistered, for sale. Estate Thos. B. Dibbles, Santa Barbara, or Lompoc, Calif., John Troup, Supt.

REGISTERED HEREFORDS—H. H. Gable. Diamond G Ranch, Esposito, California.

ALAMO HERD REGISTERED HEREFORDS (founded by Governor Sparks). Herd and range bulls. Reasonable prices. W. D. Duke. Likely, Modoc county, California.

REGISTERED MILK AND BEEF SHORTHORNS, bulls and heifers for sale; catalogue free. Thomas Harrison, Santa Rosa Stock Farm, Santa Rosa, California.

HEREFORDS—Sierra Vista Herd, Minturn, California. Over one hundred registered animals. Fairfax and Repeater bulls head the herd. On highway.

REGISTERED YEARLING SHORTHORN BULLS—Heavy-boned, thick-meated. Scotch and Scotch-topped breeding. Ormondale Co., Route 1, Redwood City, California.

THE NEVADA HEREFORD RANCH, Jno. H. Cazier & Son Co., Prop., Wells, Nevada. Registered Hereford cattle. Breeding stock for sale.

SIMON NEWMAN CO., breeders of Registered Hereford, Newman, California.

HEREFORDS—Mission Hereford farm, J. A. Bunting, Prop., Mission San Jose, Cal.

GEORGE CALLAHAN, breeder of registered Herefords, Milton, California.

REGISTERED SHORTHORNS—Fair Oaks Ranch, Willits, Calif.

GEORGE WATTERSON—Breeder Registered Herefords, Bishop, California.

SHORTHORNS—Carruthers Farms. Live Oak, California.

SHEEP AND GOATS.

F. A. MECHAM ESTATE, Petaluma, Cal.—Breeders and importers of Shropshire, Rambouillet and American Merinos, both sexes. Also Red Polled cattle. Take electric car at Petaluma or Santa Rosa for Live Oak Ranch.

DORSETS AND ROMNEYS—Dorset ram lambs for sale. John E. Marble, South Pasadena, California.

BULLARD BROS., Woodland, Calif. Breeders and importers of Rambouillet sheep.

KAUFKE BROS., WOODLAND, CALIF.—Breeders and importers of Hampshire sheep.

CHAS. KIMBLE—Breeder and importer of Rambouillots. Hanford, California.

CALLA GROVE FARM, MANTECA, CALIF.—Breeders and importers of Hampshire sheep.

HARVEY S. VAN VLEEK, Lodi, Cal. Breeder of registered Hampshire sheep.

MISCELLANEOUS.

BUTTE CITY RANCH

SHORTHORN CATTLE, SHROPSHIRE Sheep, Berkshire Hogs, Shetland Ponies, Bronze Turkeys, White Plymouth Rocks. Stock for sale at all times. Third sale at the Ranch—all breeds—April 17, 1920. W. P. Dwyer and W. S. Guilford, Box P, Butte City, Glenn County, California.

HORSES FOR SALE—40 head of 3-and 4-year-old Percheron horses. Price from \$250 to \$300 for span, beautifully matched team of very kind disposition. S. L. Skaggs, four miles south of Madera, Cal.

FOR SALE—25 head of brood sows, some of them have pigs; balance to farrow about February 1st. Also 2 fine bears. J. J. Flannery, Kiefer Road, Santa Clara, Cal. Telephone, S. C. 185F4.

Livestock Shippers' Short Course

The first of the series of Short Courses for managers of co-operative livestock shipping associations under the auspices of the National Federation of Co-operative Livestock Shippers, and in charge of the Bureau of Markets and State Marketing Specialists, was held at St. Louis on November 18, 19, and 20.

Buying and Selling Cattle.

The first morning of the session was spent in the cattle pens with the cattle buyers of Swift, Armour and Morris. These men very carefully went into detail on their reasons for classifying the cattle in the various grades, told many of the tricks of telling good beef from poor, and in general gave the managers their views when purchasing. In case the cattle were not yet purchased, two of the buyers retired while the third went over the stock with the delegates, pointed out the various good and bad points of the stock, and told what he would offer. Some of the opinions expressed by these buyers were as follows:

1. The higher the breed of cattle, the better is the beef.
2. Packers will give \$5 to \$7 more per hundredweight (cwt.) for unbranded hides than they will for branded.
3. A steer that is not fed out can drink lots of water, and packers will not pay for water. It is very easy to tell when a steer is full of water, and it is discounted in the bid.
4. Nothing will make beef cut "bright" except a good corn finish.
5. New York, Philadelphia, and Boston demand heavy cattle in their purchases.
6. Small southern cattle usually fall in the "canner" class, and seldom will do for the butcher's block.
7. Small, fat heifers sell better in the South, and the big beeves in the North, probably due to the Northerner desiring fat and the Southerner lean meat because of the climate.
8. One buyer expressed a preference for a steak from a 3- or 4-year-old steer because of the better flavor of meat.
9. Heifers are preferable to near cows as they are rounder and more plump, while the cattle are rangier.
10. The "rangers" of Texas and Oklahoma are usually wild and will drink no water when they get to market. They dress out better and are all meat.
11. A good bull is just as good as a stag as far as market value is concerned.
12. The high-priced beef comes from the loins back. As the Angus and Shorthorns are blockier behind, they are better.
13. Bunchy fat on the hind quarters is not desirable. Some farmers get sore when told that their cattle, developed in this manner, will go to the canners.
14. A thin-necked steer is almost invariably thin, something else than fat causing him to stick out.
15. The Angus and Shorthorns make the prime beef.

16. Bull beeves will absorb lots of water, and therefore are good for bologna meat. They will absorb almost one-third their weight in water.

17. It doesn't pay to feed unless you intend to finish the cattle at present prices of grain and beef.

18. The commission man must be as good a judge of cattle as the packer buyer, and also knows his way of trading. It is almost impossible for a man who comes into the yards only two or three times a year to learn the fine points necessary to make an expert salesman.

On the afternoon of the second day, the delegates visited the coolers or one of the packers where it was seen how these beeves dressed out. By this method, the managers learned the ideas of the various packers, what they wanted to buy and how they graded. The outstanding impression that was to be gained by the delegates was that cattle which many farmers would consider finished were considered only "fair" by the buyers of the packers, and it was almost a waste of money to feed the cattle un-

less they were thoroughly topped out. Wednesday morning the delegates visited the hog and sheep barns where methods of purchasing were carefully investigated, and on Thursday afternoon, the coolers of the packers were visited where these hogs were inspected as they dressed out.

Thursday morning the feeder pens were visited and the expert advice of the commission men on the purchase of feeders was gained. The hog immunizing pens were also visited and the method of immunizing was thoroughly explained.

This Short Course was voted a very pronounced constructive success and resolutions were adopted to hold Short Courses semi-annually.

Delegates were present from Missouri, Arkansas, Mississippi and Illinois. Other Short Courses arranged are: Kansas City, Nov. 24, 25, 26; Denver, December 20th. St. Paul, Omaha, Sioux City, Chicago and Detroit Short Courses will be arranged for at the National Federation meeting Chicago, December 3-4.

BUY A BILLIKEN.

We do not mean a little image out of some curio store, but a real Chester White Billiken, such as C. B. Cunningham of Mills will sell you "unsight and unseen," and guarantee satisfaction, or you can go to Mills, visit the herd, and select your dollar-getters.

Mr. Cunningham has been breeding Chester Whites for years, and we can confidently say that he has retained all the good points of the breed, and added some Cunningham characteristics that place these swine right up in the front rank for practical farmers that want a prolific, easy-feeding strain, that will graze well and mature at 6 to 8 months.

The Chester Whites are one of the breeds of hogs originating in the United States some 80 or 90 years ago, and while they were rather coarse at first, this has disappeared but left all the other desirable characteristics such as prolificacy, early maturity and easy feeding qualities.

NEW MANAGER FOR NOTED STOCK FARM.

The Palo Alto Stock Farm of 600 acres of beautiful oak-studded hills and level fields, with its great herds of superb Holstein-Friesian, Guernsey, and Shorthorn cattle, is to have a new manager in the person of Ralph E. Watson of Sacramento. Mr. Watson was last with the Henderson Company, and had charge of that great herd of "blacks and whites," and is well qualified to manage a proposition such as this at Palo Alto. He will have full charge of all operations, and expects to place this excellent herd of purebred dairy cattle on a par with the best on the "Peninsula." The cattle and ranch are there, and Mr. Watson has the training and ability to place them where they will be in the limelight of high performance.

A NEW POLAND-CHINA BREEDERS' ASSOCIATION.

Merced County, not to be left out in the cold this winter, has formed a Poland-China Breeders' Association and claimed a sales date for February 21st next.

J. F. McSwain, the prominent Poland-China breeder of that place, who had claimed this date yielded the place, and consigned 20 head more or less of those he had expected to dispose of at his contemplated sale of the above date.

Mr. McSwain, in a letter announcing this new organization and change of plan, says: "A selection committee has been appointed with instructions to see that nothing goes in the sale that will not reflect credit to the owner, and to the association." Certainly a start in the right direction.

The cost of equipment is not its price at first, but it is the interest on that price, plus the cost of repairs on the equipment, plus depreciation.

RU-BER-OID and MALTHOID READY ROOFINGS

The cheapest coverings you can buy

Good ready roofing costs less to buy and apply than practically all other coverings. In addition to this, good ready roofing will provide dependable protection indefinitely with the minimum of attention—a coat of good roof paint such as Ru-ber-oid Roof Paint and Malthoid Roof Coating every few years.

Good ready roofing is therefore the cheapest kind of roofing you can buy.

Ru-ber-oid and Malthoid roofings are made by one of the oldest and largest industrial concerns on the Pacific Coast—an institution known throughout the world for high quality of products and for square dealing. Not only does this Company turn out Ru-ber-oid and Malthoid in finished form, but also manufactures the raw materials—felt and saturating and coating compounds—all supervised by experts.

When you build, remember that it pays to roof with Ru-ber-oid or Malthoid.

FEEDING FOR FORCING EARLY LAYING.

There is a difference between "forcing" pullets and merely feeding heavily for egg production, writes a correspondent in an exchange. Immature pullets can be so fed as to check their natural growth and bring them prematurely into laying. This may or may not be a good plan; it depends. If they are late-hatched and are to be kept solely for egg production, I see no objection to getting them laying as soon as possible, even at the expense of their growth. It is doubtful whether pullets so handled will lay as many eggs in the year as they would if permitted to reach their natural growth before being fed for egg production, but eggs laid before February 1st are worth twice as much as those laid in the spring, and without doubt it will pay to push late pullets about as hard as they are able to stand it, when to let them develop naturally would mean that they would not begin laying until well along in the winter.

Pullets that are practically full grown should, of course, be brought into laying at once. There is nothing gained by being too conservative on this point, and a month's production in fall or early winter may readily be lost by being too slack with them. Such pullets should have a nutritious laying ration and all of it that they will eat. There is little danger of their getting overfat. Pullets must be reasonably fat before they will lay, and practically every instance of delayed laying in well-grown pullets will be found to be due to underfeeding, or to supplying a ration lacking in some essential—usually meat. In the case of pullets slow to begin laying, meat scrap may safely be increased to 25 per cent of the mash mixture. If skim milk can be secured it will be found especially valuable at this time. As green feed, cabbages are thought by many to be extra desirable.

It is doubtful if any healthy full-grown pullet will long hold back on production where such a ration is liberally supplied, and if the feeding is judiciously done there need be no fear of injurious "forcing." In all cases where heavy feeding or rations high in meat scrap are used, the caretaker should give especial attention to the character of the droppings of the fowls, and if these become abnormal in any respect, should promptly apply suitable correctives.

ARTIFICIAL LIGHT.

Artificial light in the hen house in winter does not make Faithful Biddy lay two eggs a day, as some people seem to think, say poultrymen, but it does make conditions such that she does not have to wait for spring to begin her spring work.

The proper use of artificial illumination on layers not only increases the total number of eggs laid each year by the hen, but it gives increased production during the fall and winter when prices are high.

Using light is not a forcing measure, if rightly used, say the poultry workers at Cornell. It merely makes conditions more natural for the hen by lengthening the day and therefore allowing the hen to eat more feed and secure more exercise.

This keeps her body supplied with feed and gives her the activity which produces health and vigor and which is essential to egg production. It gives the hen 10 or 12 hours of night and the same of day.

The hen naturally is not lazy and she does not like, because of darkness, to have to spend 15 or 16 hours on the roost in the intense cold and with nothing to eat during that time. The remaining 8 or 9 hours on the floor are not enough. She would not be expected to feed as well nor lay as well under these conditions.

How long would the average human being be able to render a maximum

service if he slept or remained in bed that long, ask the Cornell workers? Many folks might like to, and suffer the resulting inefficiency, but the hen has no desire to do so, and will get up and start work at 3 a. m. if light is provided.—Exchange.

WHY CHINESE EGGS ARE OFF-GRADES.

The Chief of the Poultry Division of Canada, in an address at a recent poultry conference, made this statement anent competition with Chinese eggs: "The producing sections of China are upwards of a thousand or two thousand miles inland from Shanghai. They have to bring these eggs down by slow river transit, and

the eggs that arrived in Canada last fall and came under our Canadian regulations would not pass the inspectors at a grade higher than seconds. Distance and other factors are in our favor, but we must reckon on having to meet the Chinaman as a particular competitor in England." American producers are, of course, up against the same proposition.

THE OAKLAND POULTRY SHOW.

The 19th Annual Poultry Show held at Oakland last week was the largest ever held on the Pacific Coast. Over 1800 birds were shown in the Poultry Department and over 1000 pigeons. The rabbit show, too, was the largest and best ever held on the Coast.

In that the White Leghorn contributes a large percentage of the State's egg production, it was fitting that this breed should have the largest representation. Numerous entries of Anconas would indicate that this is a

coming breed. Rhode Island Reds, Orpingtons and Plymouth Rocks, well known and popular breeds, were represented in numbers about in the order given. There was a good showing both in quality and numbers of nearly all the breeds we had ever heard of and some new ones. One of these, the Bare Necks, apparently a cross between turkey and chicken, will probably win laurels for utility rather than for beauty.

The show was splendidly staged in the Auditorium and was well attended throughout the week.

Experts who have been studying the shortage of eggs in London, estimate that there are 180,000,000 fewer hens in the world now than there were just before the war. England used to import 200,000 tons of eggs yearly, but because of the shortage this country is able to buy only 40,000 to 50,000 tons.

It's not fat—it's EGGS you want

Are your hens just boarders? Fat and lazy? All their food going to flesh? Nothing left for egg production? Madam,—Your hens' egg organs are dormant, and if you are going to be satisfied to let nature bide its own time to revive these dormant egg organs, it will be Spring eggs, not Winter eggs, for you. But why wait on nature?

You can speed up egg production—you can make your hens lay now by feeding

Dr. Hess Poultry Pan-a-ce-a

It contains *Nux Vomica* and *Quassia*, the best nerve, appetizing and digestive tonics known to the *Materia Medica*—tonics that promote a hen's digestion—tonics that tone up the dormant egg organs so that the proper amount of food goes to egg production, and not all to flesh, and fat, and laziness, when it's action, and eggs you want.

Pan-a-ce-a supplies the additional iron for the blood, which is essential to the speeding up process. It contains certain forms of lime that supply the needed material for making egg shells.

Dr. Hess Poultry Pan-a-ce-a insures a healthy, singing, laying, paying poultry flock, Winter as well as Summer.

Always buy Pan-a-ce-a according to the size of your flock. Get it from a reliable dealer in your own town. Tell him how many fowls you have, and he will supply you with the proper sized package, which is guaranteed. 30c, 60c, and \$1.25 packages. 25-lb. pail, \$3.50; 100-lb. drum, \$12.00. Except in Canada.

DR. HESS & CLARK, Ashland, Ohio

Dr. Hess Instant Louse Killer Kills Lice

A FEED FORMULA.

Would you kindly fix up a formula in parts, to stated feeds, which I have got and am not quite certain how to feed same to year-old hens and baby chicks. Now I have got dirty wheat flour; a breakfast food called cream of barley, which is a rejected product, also vitus, which sound good and is a breakfast food, and whole wheat and health bran, and also ordinary bran, such as can be bought of feed merchants, and I feed beef scraps, bone green, ground and fish meal. These meats I feed as a change mixed in dry mash. What I should like to know is something in the way of a formula. Barley grass is my green feed at night for last feed. I give scratch feed, \$4 per sack variety.—H. H. B., Santa Monica.

We recommend our correspondent to feed daily to each mature fowl about one and one-half to two ounces of whole grains, and all the green barley they will eat. When using the materials mentioned the following formula will make, approximately, a proper mash to be fed with the whole grains and greens to provide a balanced ration for egg production: Five parts bran; one part each of, wheat flour, cream of barley, vitus, meat scrap (or fish scrap), and green ground bone. We think it advisable to use all of the materials mentioned for feeding the mature fowls and to supply the baby chicks with commercial chick feeds that are now readily obtained where feed stuff is sold.

IRON TONIC FOR HENS.

To the Editor: Kindly give me directions for a good tonic with iron for my hens. They need it badly.—Mrs. E. G., Napa.

Improved Douglas Mixture is the most satisfactory iron tonic for poultry. This is made as follows: Mix two ounces sulphate of iron and one-half ounce sulphuric acid dilute, and stir with a stick. Add hot water until dissolved. When cold add enough cold water to make one gallon of mixture. Keep in glass or earthenware container. One teaspoonful of this mixture to one quart of drinking water makes a strong tonic; half that amount is sufficient when used continually for a week or longer; and one-quarter the amount for young chickens.

COMBS AND FLESH DISCOLOR.

To the Editor: Some of my hens and pullets have been sick. Have not lost any yet, but their combs and flesh turn yellow, and after a few days their combs turn a dark purplish color. They have a slight diarrhoea, and sit around, having very little appetite. In about a week they appear to get well again. What can I do for them?—J. W., Brentwood.

These fowls are suffering from some disturbance of the liver which may be due to overdoses of common salt placed in the feed. The symptoms described indicate both congestion and inflammation of the liver. If the trouble is not caused by too liberal feeding of salt we suggest that it is the result of continued over-feeding of starchy and other fattening feeds, and insufficient green stuff, charcoal, grit, and shell. Feed more crude protein than is contained in such things, as meat, meat scrap, fish meal, green ground bone, and bran; also all the greens they will eat. A total lack of salt in the feed may have contributed to the ill health of the fowls.

CALIFORNIA EGG-LAYING CONTEST.

The four hundred and eight pullets entered at the California Farm Bureau Egg Contest started on their official test on the morning of November 16, 1919. On account of the change in housing, feeding and other general care, and also in many cases climate, the hens are not up to their best for the first week, while many of the outside birds, those coming from other parts of the State, have been thrown into a molt. The Santa Cruz birds as a whole are doing the best, due to having undergone the

least change. Highest records for the week are as follows:

Highest Pens.

W. J. Neef, Santa Cruz 35 eggs
F. Stalling, Santa Cruz 34 eggs
Hollis Peck, Santa Cruz 34 eggs
C. T. Brown, Santa Cruz 33 eggs
C. K. Hale, Santa Cruz 32 eggs
Theo. Clark, Santa Cruz 31 eggs
B. F. Rose, Santa Cruz 30 eggs

Highest Hens.

Warren Wood, Santa Cruz—
Hen No. 255 6 eggs
Hollis Peck, Santa Cruz—Hen
No 383 6 eggs
R. C. Gibson, Newhall, Cal.—
Hen No. 66 6 eggs

CLEAN LITTER MAKES GOOD LAYERS.

An Eastern poultryman with 440 hens found that when the litter in the poultry-house was clean the egg production per day was 212. He left the same litter 6 weeks and during this time the eggs laid fell to 80 per day. He then put in clean litter and in 2 weeks the egg yield went up to over 200 a day.—Extension Div. N. D. Agr. College.

Poultry Breeders' Directory

Rate 3½ cents per word each issue.

GOING OUT OF BUSINESS—25 thoroughbred Golden Bronze turkeys and two gobblers for sale. 2 years old. \$7.00 each. Gobblers, \$15.00 each. This stock is A-No. 1. Also 504-egg Jubilee incubator, never been used; bought last year. Will sell for \$47.00; cost \$55.00. Apply M. F. McCormick, Le Grand, Cal.

WHITE LEGHORN BABY CHIX—Heavy laying, Hoganized stock. March \$15.00 per 100; April and May, \$13.50 per 100. Safe arrival of strong live chix guaranteed. Pioneer Hatchery, 408 Sixth St., Petaluma, Calif.

FOR WHITE HOLLAND TURKEYS write J. L. Fulton, Glenn, Calif.

BABY CHICKS—From my Single-comb White Leghorns, bred for heavy layers, which have been in the race for 12 years, and today is among the leaders. You don't go wrong by placing your order with me. Write for prices and terms. H. A. Schlotthauer, Exeter, California.

PEERLESS WHITE WYANDOTTES—Our 200-egg strain, bred for years for show qualities and high egg production. 50 cockerels, 100 pullets for sale. Trios and mated yards. Eggs for hatching. Catalogue free. J. W. Atkinson, Box 8, 130 Willard St., San Jose, California.

THOROUGHbred S. C. White Leghorn chicks in 100 and 1000 lots from Hoganized and trapnested stock. Order early for spring delivery. Inventors and Distributors of "Forbros" Separator and trapnest combined. Forster Brothers, 2918 Otis St., Berkeley, Cal.

LIGHT BRAHMAS—Large stock direct from the East. Cockerels, \$5.00 to \$10.00 each; pullets, \$5.00 to \$8.00, non-related. Golden Sebright and Black Cochins Bantams, Rouen Ducks. All prize stock. Emma V. Miller, R. D. 2, Box 534, Santa Cruz, Cal.

BABY CHICKS—Order now for 1920 and get what you want when you want them. White and Brown Leghorns, R. I. Reds, Barred Rocks. Safe arrival guaranteed. Write for free circular. Stubbs Poultry Ranch and Hatchery, Box 67, Palo Alto.

BABY CHIX—We specialize in R. I. Reds, Barred Plymouth Rocks, Black Minorcas. Bred and mated for eggs, size, color. Dates made by us are kept, so order early. Popular price, any number. Denton Poultry Yards, Campbell, Cal.

"WATCH US GROW"—Baby chicks. Booking orders now for January and February delivery. White and Brown Leghorns, R. I. Reds and Barred Rocks. Safe delivery guaranteed. Order early. E. W. Ohlen, Campbell, Cal.

LAYING BARRED ROCK PULLETS—Fine type birds just starting to lay dollar eggs. To close out immediately they are being shipped at \$30 per dozen. Geo. L. Horne, Winton, Merced Co., Cal.

CALIFORNIA POULTRY PRACTICE

A Practical Treatise on
POULTRY RAISING
In California

By Mrs. Susan Swaysgood
Writer and Breeder of
Utility Poultry

160 pages of text, besides many
full-page illustrations.
Cloth bound.

In writing this book, the author, after a lifetime of active, practical and successful experience in poultry raising on the Pacific Coast, has endeavored to show the farmer how he can make the poultry department of his business more profitable. It deals with actual conditions—not theories—and covers every phase of the industry from eggs, chicks, diseases and remedies to the profitable marketing of the products of the poultry farm.

Price, \$1 per Copy, Postpaid

This book will help you in the many
details of poultry raising.

THE HOME CIRCLE

HAPPINESS.

There's joy in the song of the robin, that rests on the twig of the tree, And there's joy in the blossoms of summer, and a thrill in the roar of the sea, Oh, the peace and the gladness we're seeking, are clothed in all manner of dress And some in the laughter of children may come to their dream of success.

There are millions of ways to be happy, and only one way to be rich, The king with his treasures may envy the toiler who digs in the ditch, For the king is a slave to his station, but the toiler each evening is free To follow his fancy of gladness whatever it happens to be.

There's joy in the smile of a comrade, and joy in the blue of the sky, Who lives in the sunshine of friendship has joy that no money can buy, There is peace to be found in the valleys and calm in the shelter of trees, And millions of people are happy in claiming such pleasures as these.

The man that is proud of his children owns more than the man with his gold, And he that has chummed with the songbirds has found a delight he can hold; There are millions of ways to be happy, too many by far to recall, And who lives but for gold and for silver has chosen the poorest of all. —Edgar A. Guest.

THE TRANSITORY TRAMP.

Miss Eliza Brown was alone. She sat on her front porch, and now and again cooled her cheek by a nervous jerk of her palm-leaf fan. The rockers of her chair gave forth a dismal squeak, as her small but weighty person swayed forward and back. She was much discontented and very ner-

How long does a pound of tea last?

Depends on the tea.

Fine tea has more cups of real tea-flavor to the pound than common tea.

On the other hand, you drink more: it is so good.

Think this over; and try Schilling Tea, the fine practical economical tea of this country—your money back (at your grocer's) if you want it.

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchment-lined moisture-proof packages. At grocers everywhere.

vous—unstrung, she would have said—and her flushed face and aggrieved eye proved her no liar.

Miss Eliza's character included two very opposite qualities—a quick, high temper and great timidity. We see this combination in men very often, but in women it is rare. Miss Eliza had the arched nose and valiant coloring of England's Virgin Queen, contradicted by a mild eye, an insignificant mouth and a double chin. Her height was not much to speak of, and her figure was of the down-cushion order—soft and puffy.

Her thoughts just now were troublesome. They hovered persistently about a conversation she has listened to the night before, while taking tea with a neighbor. The subjects of this conversation, instead of remaining decently buried in oblivion, haunted her. They were rather a ghastly lot, taking them altogether. The first was set going by a girl who said that there had been more tramps hanging round this summer than ever before as far as she knew. Then followed stories of the bad behavior of these horny-footed and light-fingered gentlemen, tales of the evil deeds of gypsies, thieves and murders, of the villainy of Italians and the wily ways of the peddling Jew-man, till every one's flesh began to creep, and the younger girls giggled hysterically; till Miss Eliza's crimson cheeks faded to a faint heliotrope, and Miss Eliza's niece, who was present, trembled with delicious excitement. After it was over these two found their way home through the gathering gloom, the one with boldness of speech and an eye that shunned shadowy corners, the other thrilling at every rustling leaf and inwardly thirsting for adventure.

Now Miss Eliza was alone. "The girl," Miss Eliza's helpmeet, had gone to visit her mother, and Pauline, Miss Eliza's niece, was spending the afternoon with a friend about half a mile down the road. The house seemed very empty and isolated, just the place in which to enact a tragedy of the deepest dye. Miss Eliza reflected that in all tales told the night before, the bloodiest misfortunes ever befell the lone woman who lived a half-mile down the road, and could there be a fitter subject for such horrors than herself? She thought, too, that Pauline was not likely to return before sunset, for she had refused to let her take part in some amateur theatricals, and there was a coolness between them.

Miss Eliza rocked uneasily and scanned timorously the dusty road which ran past the garden gate. After a half-hour of this watching and fearing, she calmed a little and went into the house for her sewing. What was her dismay, when she stepped forth again upon the porch, to see a very ragged tramp come toward her up the gravel path and mount the steps. He stopped when he reached the step below her and smiled.

He was a young man, not over twenty-two or three, maybe younger, and rather handsome, but his black brows were very sharply marked, and there were deep shadows under his eyes, which gave him a deadly look, and the smile which now lifted the corners of his mouth brought to Miss Eliza only a more lively idea of how he would look as he gloated over her mangled remains. He stood, silent and smiling, and Miss Eliza felt she must say something. She gave a furtive glance down the road to see if any one were coming, then she raised herself on tiptoe, pointed a fat finger to the gate, and said:

"Go away."

She wished to trumpet this command in high, peremptory tones, but instead it came forth feebly and with a tremulous nasal twang.

The tramp shook a little, as though with suppressed laughter, then said in a deep and hollow voice:

"I'd rather stay here, ma'am, if it's all the same to you."

The voice suited his cadaverous eyes, but there was something incon-

gruous and ghastly in the silent laughter that took hold of him and shook him at intervals.

Miss Eliza took a step backward. "What do you want?" she demanded. "If yer don't mind sittin' down and listenin' to me for a few minutes, I'll tell yer."

Miss Eliza, being scarcely able to stand, did as was suggested. The tramp also took a chair. He folded his legs and clasped his hands about his knee. His hands were small and well shaped, but very dirty; his feet were exceedingly large. Somehow the look of those smooth, soft fingers gave Miss Eliza a creepy feeling round the throat. The tramp began to speak in a rather affable manner, but with the same hollow voice.

"Yer ask me, ma'am, what do I want,

and I'm a-goin' to tell yer. First, I want the silver spoons and candlesticks and the teaset what's in the dinin'-room; then I want the stuffed hummin'-birds in the front parlor and the silver cake-basket what stands on

DREADNAUGHT
BLAZING-AWAY-IN-COST-DEFENCE!

SECRETS.

We won't mention any names, but this message is for "Dad" only, so consider it labeled, "Do not open until Christmas." Daddy Boy, wouldn't it be rather nice to give mother something out of the ordinary—something that would be really extraordinary, in that it would be a source of cheer all the year? A thing so acceptable and full of comfort it would affect the whole household.

Can you think of anything that would do this quicker and easier than a Dreadnaught Oil-Gas Burner?—real gas, good and clean, and in the same old home stove, but with a total absence of the usual unpleasant duties. The expense of such a present is more than within reason and when considered from the standpoint of economy, is a profitable investment.

If you are not familiar with the honest merits of the Burner, send for our circular quick so that we can get everything fixed up and in mother's stocking "the night before."

GHIRARDELLI'S Ground Chocolate

THE PREMIER BURNER

How much wood would a wood-chuck chuck, if a wood-chuck would chuck wood?

This is a foolish question, leading to a serious one—which is: Can you afford to gather or buy wood and then cut to proper size, to be used for heating and cooking? When a Premier (generating a wholesome gas from kerosene "common coal oil") will give you a cleaner fire at a cost of about 2 cents per hour—take your pencil and figure your times worth per hour in comparison with the operating cost of the Premier; the result will be startling.

The PREMIER is reasonably priced, and you soon save enough from your usual fuel outlay to pay for it.

\$10.00—for heaters

I want all the pie and cake yer was makin' this mornin' and all the gooseberry jam on the top shelf of yer store-room. And if yed don't care to give it to me," the tramp winked slowly and made a motion as though to draw a revolver from his breast, then repented and went on:

"Yer see I have pervided myself with a place to stow 'em in," and he brought forth from under his coat a large and rather gaudy calico bag. He spread this out before him, then fell to shaking again with his horrid, suppressed laughter.

Miss Eliza was stupefied with terror. As this young but awful man laid bare his sinful plan, and enumerated her dearest household treasures, the blood left her cheeks drop by drop and her round blue eyes opened too wide for tears. When he finished, she could only gasp feebly. Then she found voice to murmur:

"Please, won't you leave the cake-basket?"

The tramp ceased to laugh and looked solemnly at her.

"Why, ma'am," he said, "how can you ask it?" His voice had a disagreeable way of running up into the falsetto. "No, I will leave nothin'." He got up and pulled his hat farther over his eyes. "My time is yours, ma'am, to come along. Sooner or later, it's all the same."

Miss Eliza could not summon sufficient strength to move, but when the tramp winked at her slowly, then covered his mouth with one of those dreadful little hands of his, and indulged in silent laughter, she jumped to her feet with nervous haste and led the way into the house with rapid though tremulous movements. They went from dining-room to parlor. She shut her eyes as the silver teaspoons, candlesticks, teaset and cake-basket were placed in the recesses of the calico bag, and it was scarcely cheering to be told that the "hummin'-birds had best be saved till later, and would do to ornament the top." The paper-cutter in the parlor and the silver salt cellars were also swallowed up. Then the two wended their way up the narrow stairs.

The tramp became every moment more jubilant, and Miss Eliza more wretched. Miss Eliza fully expected to be elaborately murdered when they reached the second floor. This tramp, with his smiling mouth and hollow eyes, with the smooth, small fingers, the convulsive laughter and the cavernous voice was sure the kind to torture one to death, and hug himself ecstatically at the sight of one's dying agonies. Wherefore she went up the stairs one step at a time, till the tramp snapped his fingers and begged her to step a little lively. Poor Miss Eliza! in all her plump and peaceful life she had never dreamed of such hideous excitement.

At the head of the stairs was the door that opened into Pauline's room, and to this the tramp motioned her. They entered. It was a pretty place. The sunlight filtered through the apple trees and the ruffled curtains, and lay cool and shining on the neat matting and the little white bed that stood in the corner. Water-color sketches were stuck up in every direction, and on the opposite wall hung a picture of Pauline done by herself. It was not very good, and for a moment or two the tramp paid no attention to it. Then it caught his eye. He took a long stride forward, and stopped as though spellbound with admiration. Then, clutching at his breast convulsively, and with eyes still riveted upon the picture, he said in hollow tones:

"Lord! who may yon angel be?"

Miss Eliza had a moment's hope that all this was but a dream, for the tramp's every movement seemed to grow more unreal and like a nightmare. Then her fears redoubled, and she weakly whispered:

"My niece, Pauline."

"Pauline!" repeated the tramp in dreamy ecstasy, and again, "Pauline!" Then he let go the bag, fell on one knee, clasped his hands and raised them toward the picture.

"O pure and lovely angel!" he exclaimed. "What goodness and what beauty shine from thy heavenly face! How sadly those holy eyes look into my sinful soul!"

Miss Eliza's jaw dropped weakly. Perhaps this was the most astonishing of all the past half-hour's experiences. To be sure, Pauline was a pretty girl, but there had never, as far as Miss Eliza knew, been any marked holiness in her expression or conduct.

The tramp now got upon his feet.

"Ma'am," he said, "I am converted, and 'tis all the work of that angelic creature. I am a-goin' to give up my evil life, and you will be the first of the many new leaves I am about to turn over. But remember, it is all her doin'! You will have to thank her that the cake-basket remains in the family, and that yer still a-wearin' that hair-brooch. Only, there is one condition that I make;" his voice grew more hollow and he laid his hand on his hidden revolver. "Swear that you will treat her like an angel; that you will refuse nothin' she may ask of yer. Swear! or—"

Miss Eliza swore.

"Farewell! Pauline," said the tramp, with another long gaze at the picture, "I'm a-goin', but I'm carryin' yer image with me in my heart."

He left the room, and Miss Eliza heard his footsteps down the stairs down the gravel walk, and down the road, till they died away in silence; then she fell down upon her knees, and clasped her desecrated household goods to her ample bosom, murmuring broken thanks.

Half an hour later, and half a mile down the road, two girls were together in an upper room. One, who was small and fair, was sitting on the floor, both feet curled under her, her chin between her hands and her elbows on her knees—an attitude showing enthusiastic interest. The other, who was tall and had fine eyes, stood before the glass. Her hair was a good deal tumbled, and her hands were dirty; she was busy rubbing burnt cork off her cheeks and eyebrows.

"Do you really think, Polly, she will let you do it now?" asked the little one.

Pauline turned about.

"I am sure of it," she said.

Then, as the last traces of burnt cork disappeared, she leaned toward the glass.

"And it's all the doin' of this angelic creature," she laughed.—Harvard Advocate.

HOUSEWIVES' LEAGUE.

The women of the bay cities have organized a Housewives' League for the purpose of combatting the high price of milk, butter and eggs.

The league stands for the following principles; a study of economic conditions; reduction of the price of necessities to a just level; consideration of all questions for the welfare of the family.

It is hoped and expected that the league will enable housewives to know clearly what they should pay for the necessities of life.

At a recent meeting, Mrs. Jaffa gave a report on the present egg situation, stating that by investigation it was found that while some chicken feed had increased in price within the year, others had not and that eggs ranged from four to eight cents a dozen higher than for the corresponding time last year.

She emphasized the thought that there was no desire on the part of housekeepers to demand eggs at a cheaper price than they could be produced, but merely an intelligent investigation to discover why they had soared so high that the family of limited income was obliged to entirely discontinue their use, no matter how valuable they were as a diet.

ONE-CRUST FRUIT PIE.

Have pie crust baked. Pour juice from can of berries into a saucepan and heat; if there is not enough juice add water. Allow ½ cup sugar and 1 heaping tablespoon cornstarch per pie, mixed to a paste with cold water, then pour into the boiling juice. When thickened stir in the berries and turn into the crust, cover with icing or whipped cream and serve. A quart can of berries makes two large pies. Any other canned fruit may be used thus.—Exchange.

A Kodak Christmas

Kodak helps to make the Christmas merry—then keeps a picture story of the Christmas merriment.

And nowhere are there more Christmas pictures for the Kodak than in the country, where Christmas is so real, so home like, so full of the old-fashioned, whole-souled spirit of the day.

The arrival of the visitors; the children romping in the snow; the gorgeous sun and snow effects in the orchard; the family dinner party ready for the attack on the savory bird whose bronze glory fills to overflowing the huge platter at the head of the table—grandmother busy with her knitting and dreaming of a Christmas of other days; and the tree itself—all these are subjects for the Kodak.

In taking and titling the pictures there is fun and interest that give an added zest to the Christmas merry-making—and afterward these pictures, telling so faithfully the home story, help to keep fresh the memories of the great home holiday.

Put Kodak on your Christmas List.

If it isn't an Eastman,
it isn't a Kodak.

EASTMAN KODAK CO., Rochester, N. Y., The Kodak City

Market Comment

Butter Climbing.

While fresh butter is in good demand, there is a disposition on the part of the consuming public to shy at the rising price and to content itself with the storage article. As a result there have been heavy withdrawals from storage. It looks as though still higher prices are on the way. The resumption of foreign commerce in butter, cut 80 per cent during the war, presents a problem that is engaging the attention of the dairy industry in the United States. The perplexing question is whether the nations that had sent 600,000,000 pounds of butter to Great Britain and Germany before the war, will regain those markets now; or, failing in this, seek to send their surplus products here. Butter in Chicago climbed another quarter-cent to 76 cents a pound December 2. It was declared there is a vast quantity of butter and eggs laid up here for England and Belgium.

Wheat Minimum Exceeded but Little.

W. A. Starr of the U. S. Grain Corporation stated this week that the minimum price fixed by the Federal Government on wheat at Pacific Coast terminals, \$2.20 a bushel, has been exceeded very little on the Coast save in the case of strong, glutinous wheat such as bakers prefer, and some of these varieties have, on the Pacific Coast, brought 60 or 70 cents above the Government minimum price, although the Government pays no premiums while accepting wheat offered at the \$2.20 rate. But this increased price, based on a great demand for a wheat that is deficient in quality to meet the needs of bakers, is nothing to the increase that has been noted in the East.

Increased Cost of Raisin Production.

The cost of raisin production, including packing, increased \$25 a ton, or 1½ cents a pound in 1919 over 1918. W. M. Giffen, president of the California Associated Raisin Company, testified this week before the Federal Trade Commission. It cost the association approximately \$50 to pack and sell a ton of raisins, Giffen said, as against the Bonner Packing Company's figures of \$40 a ton, adding that the association's costs necessarily were higher than those of an independent concern because of the nature of the organization.

No Good Reason for Cheaper Beans.

"There is no reason for American beans selling below cost of production as Europe needs all surplus bean stocks over home requirements," says Herbert Hoover. Bean prices have been comparatively low until recently, when the Association made a number of large sales of 1918 stock at the following prices: pinks, \$6.21; small whites, \$6.05; large whites, \$6.25; blackeyes, \$6.00; bayos, \$6.10. These sales approximated 30,000 sacks.

Eggs, East and West.

Eggs are moving Eastward in carload quantities, where they command up to \$1.05 in retail stores. That is why eggs are scarce and high at coast points. Restrict the sale of California eggs to California markets and the price would drop quickly, despite high-cost feeds and high-priced labor. "Extras," weighing 22 ounces and over, are at this writing selling at 95c; "pullets," weighing between 19 and 22, are quoted at 82c.

Watsonville Apples Seized.

On complaint of United States Attorney Annette A. Adams, 1200 cases of dried apples en route from Rosenberg Brothers & Co., Watsonville, to Stockholm, Sweden, this week were seized at the waterfront by deputies from the United States Marshal's office on the ground that the goods were mislabeled.

Co-operative Buying.

The farmers of California have been so successful in effecting selling organizations for the disposal of their crops that they are now turning their attention to co-operative buying, and are quite generally discussing plans to that end.

THE MARKET REPORTS

SAN FRANCISCO

San Francisco, December 3, 1919.

BARLEY.

While the holiday of last week caused a certain dullness in the market barley continues strong at last week's quotations. The rains of the past few days have had no effect as yet, although it is generally conceded that they mean better feed on the ranges if they continue and therefore lower prices of grain for feedstuffs. Futures continue strong.

Feed \$3.40@3.50
Shipping \$3.45@3.55
OATS.
Red feed was stronger this week on a demand for oats for feedstuff and in sympathy with the general strength of barley.

Red feed, per cwt. \$3.00@3.10
Red for seed Nominal
Black for seed \$3.25@3.50
Recleaned Red or Black for seed Nominal
COBEN.
Egyptian was advanced somewhat in price this week in sympathy with the general strength of the grain market, although there were no large sales reported.

California \$3.60@3.70
Egyptian, choice \$3.40@3.50
HAY.

There was no change in the hay market and prices were maintained at last week's level. Receipts of hay at this point continue below the normal, and there is no change in the car shortage. In fact, the coal situation in the East and the taking off of many trains in that section are having their effect here, though the roads of this State are operated on an oil fuel. However, if an embargo on trains going East is maintained for any length of time, it should release cars which can be used in this State for hay shipments. As all hay is now practically under cover, the prevailing rains should not do material damage to the crop.

No. 1 Wheat, or Wheat & Oat \$20.00@24.00
No. 2 Wheat, or Wheat & Oat \$19.00@21.00
Choice Tame Oat Hay \$22.00@25.00
Wild Oat Hay \$18.00@21.00
Barley Hay \$18.00@22.00
No. 1 Alfalfa Hay \$20.00@25.00
Stock Hay \$15.00@18.00
No. 1 Barley Straw, per bale50@ .80

FEEDSTUFFS.

Prices of rolled oats and cracked corn were advanced this week on a fair demand. Lower prices are not looked for in feedstuffs until the ranges are capable of being used again for feeding stock. If the present rains continue this should be some time in January.

Rolled Oats \$65.00@66.00
Rolled Barley \$69.00@70.00
Cracked Corn \$81.00@82.00
Alfalfa Products \$38.00@45.00
POTATOES, ONIONS, ETC.

Oregon garnet seed potatoes are coming on the market, although they are not yet plentiful. They sell at \$3.00 per cwt. There has been little demand for seed potatoes as yet, but if the rains continue it is expected that an active inquiry will develop. The market for potatoes in general is in a fair condition, although it cannot be said to be active. Prices, however, are being firmly maintained. Onions are much stronger, and on a good demand have advanced during the past week from 25 to 50 cents. Sweet potatoes are also strong and the bulk of sales are being made at \$4.00 per cwt. The general vegetable market has been inactive with little change from day to day in quotations. Lettuce is somewhat scarce and not of best quality, but its price was advanced to \$3 for the best.

String Beans, lb. 12@17 1/2 c
Peas, lb. 15@25 c

do, Green, Alameda Nominal
Garlic, lb20@22c

BEANS.

The bean market is becoming more active, and reports from the East indicate that the market there is almost bare of California beans. New crop bayos, blackeyes and Mexican reds were most in demand and the prices of these three varieties were advanced. Local dealers are more hopeful this week than they have been for some time, and the prospects that the 1919 crop will be successfully cleaned up before the next crop appears now seems to be excellent.

Variety Old crop New crop
Bayos \$7.00@7.25 \$9.00@9.25
Blackeyes \$5.75@6.00 6.25@6.40
Cranberry \$6.00@6.25 7.25@7.75
Pinks \$5.50@5.75 6.15@6.40
Red Mexican \$5.00@5.75 6.80@7.25
Tepary \$2.50@2.75
Garbanzos 9.50@10.00
Large Whites \$5.25@5.50 6.10@6.25
Small Whites \$6.00 6.25@6.35
Limas \$14.50
do, Baby \$13.00

POULTRY.

The week after Thanksgiving is always a dull one in the poultry business. Prices for all descriptions show no material changes from a week ago. Turkeys are quoted as low as 36 to 40 cents, but the demand is so light that these figures are practically nominal. Live turkeys are not quoted, although they would probably bring about the same price as the dressed bird. Old geese are more in demand than the young stock at this season and bring the same price. There was a good demand for Jack rabbits, and stock in really good condition readily sold at from \$2.50 to \$3.50 per dozen.

Broilers, 1½ lbs. under 36@40c
do, 2 to 3 lbs. 32@36c
Fries, 2 to 3 lbs. 32@33c
Hens, extra, per lb. 34@35c
do, Leghorns 30@33c
Smooth young roosters, per lb. (8 lbs. and over) 30@32c
Old Roosters, colored, per lb. 22c
Turkeys, dressed, young spring, lb. 36@40c
do, live Nominal
Geese, young, per lb. 28@30c
do, old, per lb. 28@30c
Squabs, per lb. 60@65c
Ducks, young 28@30c
do, old, per lb. 25@27c
Belgian hares 16@20c
Jack Rabbits \$2.50@3.50

BUTTER.

While butter dropped a cent in the quotations today the market is regarded as having inherent strength which will prevent any material lowering in quotations. While butter was higher during November this year than last year, the difference was not so great as in the case of eggs and many other products. December of last year showed an extreme of about 5 cents above the high of November, 1918, and an average higher price of about 3½ cents. Therefore, based on last year's quotations for December, butter may be expected to go from 3 to 5 cents higher during the present month. Reports that the Eastern markets are being pretty well cleaned up gives an element of strength to the local market.

Thu. Fri. Sat. Mon. Tu. Wed.
Extra .63½ 64 64½ 64½ 64½ 63½

EGGS.

Eggs took a decided drop owing to the lack of demand at the holiday season. They immediately showed partial recovery and reached the top again on Monday of this week. They were a cent off today, on natural reaction. After the close of the exchange session today came the news that extras sold in New York

at \$1.05 and this will undoubtedly add strength to tomorrow's market. A feature of the week has been the advance in the prices of pullets and underzeds, after the first drop due the holiday. Last year this differential in the prices of extras and eggs became very much less during December and continued prices extras have about reached their top, but this prediction is apt to be modified by the great demand still prevalent in the New York market. The number of cases in storage is being rapidly decreased and storage eggs advanced two cents to 60 today. Via the steamer Ventura there has arrived 1467 cases of shelled eggs and 1000 cases of egg pulp listed as from Sydney.

CHEESE.

There was very little activity in cheese this week with a small demand for any description.

California Flats, fancy 29½ c
do, Firsts 27c
Y. A. Fancy 34c
Oregon Triplet 30½ c
do, Y. A. 34c

FRESH FRUITS.

The market has been quiet since the holiday last week. Strawberries are now at the end of their season, the last case to arrive selling at \$25. Lady apples are developing a good demand which will be maintained until after Christmas. Persimmons and pomegranates are also selling comparatively well.

Apples, Jonathan, Oregon \$2.50@3.00
do, Spitzenberg, Oregon \$2.50@3.50
do, Bellflower Nominal
do, Pippin, Calif. \$2.25@2.50
do, Lady, Calif. \$3.50@4.00
Quinces \$1.00@1.50
Pears \$2.50@4.00
Grapes \$2.25@2.75
Persimmons, box \$1.65@2.00
Pomegranates, ½ orange box \$2.00@2.50

CITRUS FRUITS.

Grapefruit sold at lower prices this week, and so far but comparatively little demand has developed. Oranges went fairly well, although nearly everyone had stocked up before Thanksgiving day. Lemons are lower by 50 cents for all varieties.

Oranges, Valencia, \$3.00@4.50
do, Navel, \$4.00@5.00
Lemons, fancy \$5.00@5.50
do, choice \$4.00@4.50
do, standard \$3.00@3.50
Grapefruit, \$2.50@3.00
Mandarin, box \$2.00
Tangerines \$1.50@3.00

DRIED FRUITS.

There has developed a brisk market for dried fruits during the past week, which is unusual for this time of the year. Prices show no change from the previous week, but the dealers report that the demand has been unexpectedly large for all varieties.

Apples 17@18c
Pears 16@18½ c
Apricots 21@28c
Prunes 11@13c
Figs, Adriatic 12@18c
do, Calmyrna 15@21c

HONEY.

While quotations of honey are not changed the market is firm at these figures. There has been more local inquiry for honey this week than there has been for a long time. Dealers say the prospects are that the large stocks stored in New York are moving, and if these are cleaned up the local market will respond to the demand created thereby.

Water White 18@20c
Light Amber (Mountain) 16@18c
do (Alfalfa) 14@16c

RICE.

There has been some very heavy trading in California Japans, and sales for a large amount for export to Europe have been closed. Three steamers recently sailed from San Francisco for Europe laden with rice. Prices are firm and fairly stationary at \$10.75 and \$11.00 for choice and fancy. During the past few days there has been something of a rush for California rice, owing to the strong Oriental market, and some sales have been made at higher than the above quotations.

HIDES.

The hide market for the past week has been weak, showing a decline in prices.

No. 1 Wet Salt Kip, 15 to 30 lbs. 40c
No. 2 Wet Salt Kip, 15 to 30 lbs. 38c

Special Citrus Market Report

Los Angeles, Dec. 1, 1919.

It is anticipated that there will be a big clean-up of Valencia during this first week of December. The demand for sound stock is good. California quotations are on a basis of \$4.50 per box f. o. b. and from \$4.00 to \$3.75 orchard run. The big holiday trade has not had very much effect on the new crop of navel from Tulare. They are selling on a basis of \$4.25 to \$4.00 per box f. o. b. with some cash sales at \$3.90 per box. Up to date a total of 438 cars have been shipped from Central California this

season, as against 718 cars for the corresponding period last year. Shipments of oranges since November 1, are about double what they were last season at this time.

A large per cent of the foreign lemons imported this year have been small sizes. California has also had an unusually heavy run of small fruit. The trade, as a consequence, has objected to this, much preferring the larger size fruit. F. o. b. quotations are on a basis of \$4.50 to \$4.00 per box. Foreign lemons have brought from \$1.85 to \$1.50 per box.

GREAT UNIVERSITY WINNINGS AT INTERNATIONAL.

A telegram to the Rural Press from Chicago, received just before going to press, states that the University of California has won as follows at the International Live Stock Show now in progress there: First Angus yearling steer; first Angus steer calf; first senior Shorthorn steer calf; first junior yearling Hereford steer; third junior yearling crossbred steer; third senior crossbred steer; champion Angus steer; champion yearling, reserve champion of show; first and second Shropshire wether lamb; first, second, fourth Southdown wether lamb; first, second, third Hampshire wether lambs; first, second, third crossbred wether lambs; first Southdown pen of lambs; first Hampshire pen of lambs, first grade pen of lambs; champion Southdown.

In College classes the winnings were: first senior yearling steer; third and fourth junior yearling steers; first, second and third steer calves; first of group of five and champion steer; first, second and third on wether lambs; first on pen of five; first on five steers, five wethers and five barrows by one institution.

We'll bet that Alex McDonald is happy.

LOS ANGELES

Los Angeles, Dec. 2, 1919.

BUTTER.

Butter prices remain unchanged since last week. Demand holds up well and receipts lighter than a week ago, being 250,700 lbs. Fresh, California extra creamery.....67c do, prime first.....65c do, first.....64c

EGGS.

Prices on fresh ranch and pullets' eggs the same as a week ago, but on case counts the price declines 5c on the dozen. Very good demand reported. Receipts are higher, for the week 552 cases. Fresh ranch, extras.....77c do, case count.....66c do, pullets.....62c

POULTRY.

Prices on hens and friers have declined slightly since last reports, and demand is only fair for them. Ducks show slight advance while geese are quoted lower. Broilers advance 1c and turkeys are unchanged. Broilers, 1 to 1 1/2 lbs.....46c Broilers, 1 1/2 to 1 3/4 lbs.....46c Friers, 2 to 3 lbs.....29c

Hens.....31@33c Roosters (soft bone), 3 lbs. and up.....29c Stags and old roosters, per lb.....19c Turkeys.....35@37c Ducks.....25@33c Geese.....25c

FRUITS.

Malaga grapes and Bartlett pears are off the market. Apples and Japanese persimmons are making up the offerings and demand for them is good.

BEANS.

This market is reported dull as ever. Prices are unchanged. Even limas are neglected. Limas, per cwt.....\$12.00 Large white, per cwt.....\$6.25 Small white, per cwt.....\$6.50 Blackeyes, per cwt.....\$5.00@5.25 Tepary, per cwt.....\$3.00@3.25 Pink, per cwt.....\$6.25

WOOL MARKET POINTERS.

Two factors prevent any demand for short California fall clip wools, i. e., a very heavy demand for long, fine wool such as is used in the manufacture of the finest woolen goods, for which the buying public seem willing to pay any price, and the continual dumping on the market by the government of millions of pounds of such wool as the manufacturers need—on November 10th, 6 millions of pounds; on November 11th, 10 millions of pounds; on November 12th, 4 1/2 millions of pounds, and on November 13th, 2 1/2 millions of pounds of scoured wool. That on the 10th ult. was largely foreign—Australian and New Zealand—as was that of the 11th. This last, however, was mostly South American.

Therefore, there is practically no market for the short fall clip wools. Such wools are generally bought on a speculative basis by local dealers, then scoured and sold when opportunity offers.

BERNSTEIN'S POLANDS BRING BIG MONEY.

On Saturday, November 29th, Wm. Bernstein of Hanford offered one of the finest aggregations of Poland-Chinas ever gotten together west of the Rocky Mountains, and if it had not been for rather of a bearish feeling in the purebred hog market lately, records would have been broken. As it was, the top of the sale for a March gilt, for which Wm. Haag & Son paid \$345. M. & A. L. Bassett paid \$335 for a gilt from the same litter. The top boar brought \$175. This was a March pig bred by N. Hauck, of Humboldt County, and was bought by J. L. Lane of Lemoore.

Thirty-seven bred sows and gilts, with some open gilts, sold for \$6145, an average of \$166.08. Fifteen weanlings and late gilts brought \$424, an average of \$28.26, and eight boars, an average of \$76.87. The grand total was \$7,184.

Cols. Geo. W. Bell of Tulare, and Cy N. Clark of Modesto cried the sale.

FIFTEEN PUREBRED SALES SCHEDULED.

Col. Ord L. Leachman, the livestock auctioneer of Sacramento, has just sent in a list of 15 purebred hog and cattle sales extending from Orland on the north to Los Angeles on the south, Santa Rosa on the west, to Reno, Nevada, on the east. The stock from Reno, however, will be brought to Sacramento, and the sale held there as this location is considered much better for a purebred sale. These include the famous Tagus Ranch two-day sale at Tulare, December 16, 17th.

The animals from Reno are Short-horns from the well-known herd of W. C. Short. These cattle are range-raised, and while they are in good condition they have not been pampered, and will give a good account of themselves either on the range or in the more intensive conditions of the valleys.

TULARE HOLSTEIN SALE.

Not as favorable results as are had at some sales of this great breed due to a great extent to unavoidable circumstances. One inconvenience was the lack of catalogues. Conducting a purebred sale without a catalogue is somewhat like teaching school without textbooks. It can be done, but is not at all pleasant.

The top of the sale was reached when R. L. Holmes of Modesto paid \$900 for a cow consigned by J. P. Phillips of Fresno. Fifty-nine head were sold in all and the average was \$275. The large number of young stock was accountable, it is said, for the low average.

The cattle were from the best herds of the counties of Tulare and Fresno that are noted for their blue-ribbon Holstein-Friesians. Among the breeders consigning were W. J. Higdon, Tulare; Alex Whaley, Tulare; R. C. Sturgeon, Tulare; J. P. Phillips, Fresno; and the Post Card Ranch, Corcoran. Cols. Ben Rhoades of Los Angeles and Geo. W. Bell of Tulare cried the sale.

HOW MUCH FOR A SWEETHEART.

(Written for Pacific Rural Press.)

Their worth is always rated high by the individuals interested, rather higher than uninterested parties place their value generally. One was sold at the Shorthorn sale at the Pacific International Livestock Show at Portland that brought a good price, but like all other sweethearts, not more than she was worth. This one was Little Sweetheart, grand champion female Shorthorn this year at the California State Fair, the Los Angeles Livestock Show, the California International Livestock Show, and last at the Pacific International Livestock Show at Portland, Oregon, and she sold for \$2200, the top female of the sale. Little Sweetheart was owned by T. S. Glide, the prominent stockman and Shorthorn breeder of Davis, California. She was sired by Golden Goods, Jr., the senior herd sire of the Shorthorn herd owned by the Ormondale Company at Redwood City. She was bought by the American Importation Company of Chicago.

The Shorthorn sale was a good one, held under the auspices of the Pacific Northwest Shorthorn Breeders' Association, with an average of \$782 for 33 cows, and of \$889 for 22 bulls sold.

A Wonderful Family Gift—Overland 4 With Three-Point Suspension Springs

GIVE your family a Christmas gift of "smooth roads" this year. Give them the new Overland 4 with Three-Point Suspension Springs, the greatest riding improvement since pneumatic tires. The Three-Point Springs dissipate jolts and reduce sway and vibration to a minimum. They make riding on any road smoother and more enjoyable.

With these springs Overland 4 seems to sail over bumps, cushioned from the shocks of the worst roads, with a road steadiness never before approached by a light weight car.

The Three-Point Springs are attached diagonally at the ends of a 130-inch Springbase giving long wheelbase steadiness and comfort with 100-inch wheelbase lightness, economy and driving ease.

By protecting the car from road blows they prevent excessive wear, give every part longer life and make Overland 4 very economical in up-keep.

A still further source of economy in Overland 4 is its light weight which saves in the consumption of oil and fuel.

With all these important features, Overland 4 is in addition a car of marked beauty and smartness of design.

Its equipment is carefully selected and complete from Auto-Lite Starting and Lighting System to Rain-Vision Windshield.

Ask the Overland dealer to show you this unusual car. Try its remarkable riding ease. It sets a new standard of comfort. Booklet on request.

Apple Growing in Southern California

Written for Pacific Rural Press.

AMONG THE PIONEERS of commercial fruit planting in Southern California forty years or more ago there were many who came from the apple districts of the Central and Eastern States, who in the midst of their new-born passion for citrus and other semi-tropicals never quite forgot the loyalty of their childhood to the apple—king of northern fruits. And so they planted a few apple trees here and there throughout the southern half of the State. The outcome of this wide experimentation with the apple was a demonstration that

under certain conditions of exposure, temperature and moisture, dependent largely upon elevation and distance from the ocean, apples of good quality and long-keeping characters could be produced. Although it seemed to be a fair conclusion that situations and cultures which developed the best in citrus and other semi-tropical fruits were not favorable to the apple, it also became clear that proper soils and moisture conditions on the coast flats and uplands and in the mountain valleys would produce good apples. These early demonstrations have been reinforced by the experience of later planters, and now there are good commercial apple-producing enterprises in operation in all the southern California counties either above or below the slopes and mesas which are famous for their citrus fruits. A concrete instance of such well-planned and conducted apple enterprise is presented in the adjacent text and picture by Donald J. Dodge of Orange county, the grower who has made a success of it:

"A few days ago a representative of your paper, F. I. Cock, stopped at my ranch to solicit my subscription. I was busy at the time selling White Winter Pearmain apples from my fifteen-acre orchard, and he was quite interested when I told him that your book, 'California Fruits and How to Grow Them,' had been my guide in planning and planting my orchard. He thought you would be interested in a report of the enterprise, so I am sending you samples of fruit and a picture of one of my Pearmain trees, and am writing these few lines.

"The orchard is located on the Newport mesa, about two miles from the ocean, ninety feet above sea level, and the soil, according to the government soil survey of the Anaheim area, is 'Ramona fine sandy loam.'

"I have five varieties of apples: White Winter Pearmain, Bellflower, Winter Banana, Arkansas Beauty, and Delicious. The Pearmain and Bellflowers were planted in March, 1912, and the other varieties a year later. All the holes were dynamited the fall before the trees were planted, and filled with water during the winter. All varieties have good color, fine flavor, and are of good texture and firmness.

"I have sprayed for codlin moth since the trees started to bear, and have always gotten good control. Other pests and diseases have not been serious, though the 'Baldwin spot' has affected quite a percentage of all varieties this year, and to a less extent last year.

"Until last July I did not have all the water I thought the trees should have had, and I have not been particular about late fall and winter irriga-

tion. Most of the apples have had open calyx, and a small percentage have rotted at the core. Could lack of winter moisture have any effect on the above conditions? I would appreciate your opinion on the subject. (We are not able to trace such abnormality to the specific cause, but it is not impossible that such interference with good growing condition might result in almost any type of distortion—Editor.)

"I have sold practically all of my fruit here at the ranch, and am building up quite a business. Careful grading and culling of all wormy apples

has given me a reputation for 'Quality Apples.' I have not heretofore been a subscriber to the Pacific Rural Press, but expect to be a constant reader from now on."

Our apple-growing readers will welcome Mr. Dodge to their inner circle. A man who can grow a fruiting tree like that shown in the picture is a credit to our horticulture. The apples which he sent to testify to us the quality of his product are as large, handsome, and clean a lot of Pearmain as we ever saw. What he says of his enterprise for direct trade and the way he is building up a business by handling his own fruit and serving his customers nothing but the best, is very suggestive to those who plan to succeed, on the basis of good product and fair trade, with small, personally conducted orchards.

There is also another suggestion in Mr. Dodge's attitude toward this journal which we wish to point out. How interesting and inspiring it is to all readers to get a direct word from any one of their fellows about some concrete thing he or she is successfully doing! Such a direct word from one strikes another reader in the head, the heart, and the pocketbook—all in one shot. We have to preach a lot more than we like and often we think that our editorial shouting makes as little real noise as shaking a lamb's tail in a fur cap—as an old college president back East once said of a chapel-bell which was too small for its job of waking up the students. We would like to abdicate this pulpit altogether and sit down in front alongside the contribution-box all the time—if lay preachers would mount the platform and tell the congregation how they do good farming. We really do not care to preach all the

White Winter Pearmain tree seven years old grown by D. J. Dodge in Orange county. It is a striking instance of a well-shaped tree. The Pearmain, though not our most important commercial apple, is the winter apple which does best under the greatest variety of growing conditions and has advocates in all parts of the State.

time, showering blessings on the good and hurling anathemas on the bad like a self-constituted, editorial Jupiter. We have to do it sometimes to rebuke our rival journals for too much immorality and bumptiousness, and to make them take their proper places on the back seats, but if our readers will send us words and pictures about what they are doing with good results, as Mr. Dodge has done, we can give our readers such a good, useful journal of California farming that it will not matter what our rivals do or say about us. As for apple growing in Southern California, success consists simply in getting the right varieties in the right places and treating them right culturally. There are places which do not best the apple tree; others where early apples can be profitably grown and late varieties cannot; still other places where late apples will develop their highest excellence in crispness and long-keeping. Therefore, such local experience is of extreme value.

BUD-SELECTION ASSOCIATION.

THE committee of the California Nurserymen's Association whose duty to organize for the standardization of fruit varieties to be used in the propagation of trees was prescribed by the recent Chico convention, as described in the Pacific Rural Press of November 22, held meetings in this city on December 8 and 9, and honored this writer with an invitation to participate in the meetings in an advisory capacity. We were glad to avail ourselves of such invitation, because it is our judgment that the movement to restrict growing of fruit trees to the varieties which best serve specific purposes, and to the best types of such varieties, on the basis of quality, form, size and productivity, is one of the most important which has arisen in the line of progressive fruit growing. And while it is too soon to undertake an account of the specific forms and ways of promoting this most desirable achievement in which the committee will proceed in the discharge of its duty, it is very timely to assure our readers that the proposition is going forward immediately and with most sincere purpose of attaining results which will be of incalculable value in promoting, propagating and planting fruit varieties which shall not only be good, but specifically good for something which will help the fruit producer to use his land, time and money with more certain outcome than previous propagation-policy has assured him. The representation of the state was very wide, for the following committee-men were present, viz.: President Bergholdt and Mr. Barnicott of Placer County; Past-President Kirkman and Mr. Roeding of Fresno County, Mr. Crow of Santa Clara County, Mr. Hyde of Santa Cruz County, and Mr. Armstrong of San Bernardino County. It was unofficially stated that these men represent about 85 per cent of the deciduous tree propagation of the state, and their complete agreement as to the desirability of the movement to give the public the very best stock of all deciduous fruits to plant and the general accord among them as to the ways to proceed to reach this end, surely warrants the anticipation that speed and efficiency would be attained. There will be an incorporation which will probably be known as the "Nurserymen's Bud-Selection Association of California," which will, through its experts and business conductors, decide upon best types of all commercial fruits, secure or develop supplies of budding, grafting and cutting wood, which the members of the association will bind themselves to use exclusively in propagation and, as fast as such certified wood is available, to restrict their growth and sale of trees and vines of such varieties to stock produced from it. The articles of incorporation will provide for organization with \$50,000 of bond issue—which will be open to purchase by growers and others not directly concerned in propagation, and \$100,000 common stock which nurserymen desiring to participate in the work of the Association will be required to buy—in amounts probably from not less than \$500 upward. The association will proceed in whatever ways seem

best, by leasing or buying property from which approved buds and cuttings can be taken, or may plant and grow such materials as its directors desire to certify. It will have its own protection in the form of certificates, trademarks, tags, etc., by which trees grown from such certified sources can be distinguished from all others, so that the planter can be assured of what he is getting. It will, of course, take several years to develop the plan so that all varieties of amateur and commercial superiority can be covered, but it is expected that a beginning will be made forthwith so that some fruits may be budded-in next summer with certified varieties. The whole undertaking looks to us like a very good work, very well begun, and we shall come through with the details of it as they take definite form.

WHAT TWO YOUNG MEN DID.

We like young men if they keep their collars clean and do not swear, we like them almost as much as we do young women. We have grown up among young people and nothing but the pesky calendar suggests that we have grown away from them. Because we like them so much, whenever we hear of any of them coming through on some job of great importance to California, we feel just as proud and happy as though we had taken a hand in it ourselves—and, in the normal selfishness and conceit of old people, that is about the highest tribute of appreciation which sunset can pay to sunrise. And now we have that sort of a tribute to pay. About a decade and a half ago there were two young men in the college of agriculture at Berkeley named W. H. Volck and E. E. Luther. They were not particular paragons or "teacher's pets." One of them had a laugh which could penetrate two plastered walls and disturb our lecturing so much that we had to send a janitor to "tie up the calf!" The other had "nerves" which would cause the blackboard figures to dance when we called upon him to explain them, and he gave us much mental anguish. What we liked about these two young men was their manifest purpose to discover something worth doing, and then go ahead and do it, and they did not care whether it was in the "course of study" or not—in fact, the regular course which other young men loyally pursued always seemed to make them tired. They persisted in doing stunts of original thinking and experimenting instead of rehearsing the wisdom which the teacher provided—and that is, of course, an unpardonable academic crime! And so it happened that when Professor Woodworth sent them down to Watsonville to do things to the apple worms, they would not kill them in the orthodox way, but proceeded to get up an "ortho" way of their own, and that consisted in devising a new process of combining arsenic and lead in such a way that while it would bite the insides out of a worm which ate it it would not bite the leaves which it was sprayed upon, and therefore the leaves could be sprayed with a stronger solution of it with better killing effect on the worms and without injury to the foliage. It was a discovery of incalculable value to fruit growing, and other manufacturers of arsenicals soon began to make their output that way—overlooking the fact that Luther and Volck were not working for the university when they discovered the process, but had finished the particular job which they were sent to do and had gone into business for themselves as insecticide manufacturers and had patented their process. In the regular course of their business they proceeded against the infringers upon their patent, and a long trial was held last winter in New York in the course of which the court went minutely into the validity of the patent. The court rendered its decision on November 26, upholding the right of Luther and Volck to their discovery, and now it is up to the transgressors to pay for the injury they have done and to pay a royalty on their future operations if they continue to do their chemical manufacturing in the way these two young Californians demonstrated to be the best way.

ANOTHER UNIVERSITY BY-PRODUCT.

Now that the ground is wet, squirrel-killing will proceed by pouring or exploding carbon bisulphide in the burrows of the varmints instead of tempting

them out to eat sugared strychnine. Many of this generation probably do not know that the availability of this material and the current use of it is traceable to the alertness of a young man to do something which was no part of his prescribed course of study. More than forty years ago carbon bisulphide was being used to kill the rats in the sewers of Paris, and to the late Professor Hilgard came the idea that if the vapor would kill rats in a sewer it would be as easy to kill squirrels in a burrow as to shoot salmon in a can, and Professor Hilgard tried it with notable success on the university grounds, and published a bulletin on the subject in April, 1878. The particular phase of the history of the affair which we would recall in this connection is the fact that while Professor Hilgard was making his experiments there was a young man in college named John H. Wheeler who had a great idea of doing things outside of the curriculum, and when it was apparent that squirrels could never be killed economically with the chemically-pure bisulphide then sold at high prices in the drug stores, Wheeler started a factory on the bay shore of Berkeley and was soon turning out commercial bisulphide at prices which made it available in all general stores for pest-killing purposes. And thus it was that a bright analogy drawn from European experiments was enabled to come through into common farm usefulness, and to result in larger manufacturing enterprise to make the material available, simply because a university student had the sense and sand to do something which prescribed studies did not require of him, but which practical operation made necessary to agriculture and ministering to the need made profitable to the originator. And now, though Wheeler is old enough to have a son graduated from the university several years ago, and though he has done many original stunts on his fine fruit farm in the Napa Valley, we always think of him as the youth who jumped a lecture course on the feasibility of perfume farming in California, and built a bisulphide joint on the bay shore which, though not much bigger than a dutch oven, made more smell than all the perfumes of Araby the blest, and was the foundation of the large business of carbon bisulphide manufacture in California. We like young men when they do things which their teachers do not know enough to teach them to do!

THE UNRULY MEMBER.

We notice that the cables are being kept pretty busy in describing the beginnings of Lady Astor's career as the first woman-member of the British Parliament. What amazes us is that that which was surely to be expected should surprise the reporters so much. It seems that there is a rule of the House of Commons that members must not indulge in side-talking among themselves within the bar of the house while the latter is in session. However, being a woman, Lady Astor must talk to somebody, and kept on doing it until the Speaker of the house nearly demolished the parliamentary furniture with his gavel in the effort to enforce the rule before some one informed the new member that the hammering was for her benefit. And then, the reporter says, "Lady Astor stepped outside the bar of the house and went on talking." Of course she did: how could she help it? Our surprise is not that she did, but that the Speaker should have thought he could prevent it. Of course, he was off his guard and did not realize that the effort to recall a primal privilege of the sex with a little wooden mallet was only adding to the racket; he could not have revoked the pristine right of woman-kind with a steam-hammer—and so Lady Astor talked on. In fact the right of woman to talk when no one wishes to hear came right out of Eden. Eve had it at the time of the lock-out, and what she said to the excluding angel was a few degrees hotter than his flaming sword. Eve had it also afterwards and Adam chopped all the more thistles, not because he liked to work, but because the crunch of his stone hoe upon the Mesopotamian gravel was to his tired ears more welcome music. And the right of Eve was bequeathed to the daughters of Eve to this very day and cannot be revoked nor its exercise repressed by any recourse to rule or argument. But there is, of course, a way to do everything under the sun—even to causing a woman to renounce her most ancient right to talk.

It is to be reached by a declaration that men desire to listen. If the gavel be dispensed with when Lady Astor begins to prattle, and the house be trained to shout "Hear! Hear," in true British fashion, silence will ensue. For it is a woman's joy to talk, not when men wish to hear but when they do not. The most surprising thing about the whole episode is that the Speaker of the British House of Commons did not know that simple fact.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Wet or Dry Sprays.

To the Editor: I sprayed my apple trees with arsenate of lead powder, 1 part arsenate to 4 parts sulphur, for codlin moth and aphids. It was a complete failure for the moth. The late apples were fully 90 per cent wormy, but the early ones about one-third. Did the sulphur kill the arsenate? The apples were white with the powder, which was used dry.—J. K., Oakdale

No one can answer your questions confidently until a systematic test is made of wet and dry sprays under exactly the same conditions and expert observers, without prejudice, compare the results. We are not aware that this has been done, and so every one has to use his own judgment in choosing between ex-parte reports. The sulphur you used did not kill the arsenate and the two together did not kill the worms—perhaps because they did not get to the exact spot where the hatching from the eggs started to bite its way in. Evidently the eggs laid by the moths from the first brood which bored one-third of your early apples were not interfered with by your treatment, and there were enough of them to take nearly all the late apples you had. Your experience indicates that you cannot expect to get good fruit with your way of dust-spraying, but whether you did not dust at the right time and way, or whether dusting will not properly distribute the poison so that the young worms must eat it on their way in, we cannot tell. It is clearly the duty of some investigating institution to show us whether we should follow a wet or dry policy in fighting pests, or whether we can best fight some pests dry and others wet, and then each grower can amend the constitution of his business to meet such demonstration.

Dry Land Goat Pasture.

To the Editor: I am living on a homestead and want to plant some grass that is hardy for a goat pasture as it is very dry here. Would Johnson grass do? I have a piece of land not very good for anything else.—M. L., Saugus

Johnson grass would not do at all, for it will refuse to grow long in a dry, waste place. The game of Johnson grass is to get into the best moist land on the place and keep everything else out. If you have water you can grow alfalfa or rye grass, red top, orchard grass, etc. As you are on the edge of the desert and speak of dry conditions, none of these would probably hold on long without irrigation. You might get a lot of feed from smooth cactus. Your best chance for a grass is to look around you and find some of the desert grasses native to your region and gather their seeds for wider planting. You will often find them under the protection of your desert shrubbery, and you must keep the goats off until the plants have a chance to make seed. These plants are for growth during the rainy season. If you have a little summer water to spare you may get fullest returns for it with Napier fodder or elephant grass, and Sudan grass may be worth trying with a little water in the frostless period.

Methods with Rhubarb.

To the Editor: I am a new subscriber to your paper and like it very much. I am also new at rhubarb. I have a field of rhubarb about three years old. Many of the roots are much too large. The soil is sandy loam, sub-irrigated. I wish to get as large a crop as possible this year. What shall I do?—G. A. C., Marina

When rhubarb crowns really get too large some growers plow alongside and cut off part of the outer eyes of each crown with a sharp spade—using them for planting new areas. Turning back fresh soil against the old crowns gives them a fresh start. But we would have to be very sure that the crowns needed this treatment—they usu-

ally do not at three years old. To get the most salable product the coming year we would not reduce them, but would pile them over with fresh cow manure as soon as possible, so the rains can leach it out—and a little later rake the leavings to the middles and disk them in. If you are growing winter rhubarb you will have to hurry up with this treatment; if it is the old summer kind you can let the manure lie a month or more.

Sudan Grass.

To the Editor: What time of year is Sudan grass planted; what is an average yield per acre; what market is there for the seed; how often does it require water, and where is seed obtainable?—F. A. W., Escalon.

The seed is planted when danger of frost has passed: i. e., when you would plant corn or melons. The cut per acre depends upon the soil and moisture available; dry Sudan has cut a ton and a half per acre; irrigated, five or six tons. There has been a good market for the seed when free from Johnson grass seed, which is hard to distinguish from it. The amount of water required for a maximum growth depends of course upon how well the soil retains or loses moisture as for times of watering, an irrigation after each cutting is all right. Any seed dealer can supply the seed. We take it, you know, that the grass cannot grow in the winter and that it has to be resown every year.

Growing Feijoa Plants.

To the Editor: When is the best time to plant seeds of the Feijoa, and will they grow from sprouts and cuttings? It is a new fruit to me and any information will be appreciated as I like it.—M. L., Saugus.

The best time to start plants is when you have thoroughly ripened fruits from which to take the seeds. As the seeds are very small they should be started indoors in a shallow box or "flat"—using about three parts of clean sand and one part of rubbed-up moss or other light fibrous material; old sawdust which has been well weathered does very well. Cover not over a quarter of an inch and keep moist but not wet. The plants usually appear in about a month. Transfer the seedlings to pots or cans when small, and plant out later when they get some size. Starting from cuttings is practicable but not easy—though you may strike it right. Layering, or bending down and covering branches, is quite easy if the ground is moist and warm.

No Panacea for Pests.

To the Editor: Kindly inform me as to time and kind of spray to use, if any, for apple borers, caterpillars, and for aphids on prune and apple trees, which are found on the underside of the leaf and cause it to curl and also have a bluish powdery tint.—A. T. M., Herald.

We cannot; there is no moment of time, nor method, nor material which will serve all these pests. One has to study each pest according to its nature and the injury it does. For example, borers in fruit trees are prevented from getting in by whitewashing or other applications to the bark; after they get in they must be gone after by knife or wire. Caterpillars which eat leaves must be poisoned by covering the leaves when they are first seen with a spray of arsenate of lead; other caterpillars are fought in various ways. Leaf lice or aphids are best reduced by soap-tobacco sprays—first, as soon as they are seen and at intervals afterward. And each kind of all the other pests has its own time, method and munitions, at which and with which a war against it can be won. It is up to the grower to know individually each pest which bites him, how it lives, how it works and how to get ahead of it, and let us tell you it is no easy job.

Grain in Alfalfa.

To the Editor: We have alfalfa seven years old which is very thin and yielding very little hay. We propose to reclaim the alfalfa by seeding with barley and red oats, then spring-tooth harrowing it two ways, following this immediately by a drag harrow. To our knowledge the land has never been fertilized. What would you suggest along these lines? Is there any better way of bringing this alfalfa forward?—A. L., Merced.

Sowing grain on a scant stand of alfalfa is undertaken, not so much to improve or reclaim the alfalfa as it is to get something more from the land to make up for the small return of alfalfa. The way to get a good stand of alfalfa is to break up the

land and resow the alfalfa—giving it the sole use of the land and all the water there is available to bring it along. By winter growing of grain you may get more feed or hay than you can get from a stand of alfalfa which does not fully use the land, but the longer you do it the less alfalfa you will have until re-sowing becomes imperative if you desire to stay in the alfalfa game. Your way of putting the grain into the alfalfa is good. There will be much advantage in fertilizing the land either with stable manure or a complete commercial fertilizer. If you wish to try reclaiming the alfalfa to see whether it really can come back or not, put on the manure now and just before the growth starts harrow as you propose to break the crust and kill foxtail and other weeds and keep the grain out. It is, however, likely that you will get more by putting in the grain and arranging to re-sow in a year or two.

Manuring Fruit Trees.

To the Editor: We have almond trees two and four years old. We have bought loads of manure to put about the trees. Now some one comes along and says: "You will be in for all kinds of trouble. Your trees will become infested with borers." Is there anything to this remark? We have an apricot tree and we put some half-rotten manure about it the first and second years. It is some tree! It looks about a four-year-old, so we wanted to feed the almonds too. Is it dangerous?—M. S., Merced.

Do not put manure too near to the trunks of your fruit trees; work it into the land between them, and it will promote root-extension. Too much heaped around the trees may kill the trees by burning the bark and then borers will take advantage of sick bark to get in. In the case of the apricot tree you fortunately did not use enough to hurt the bark, but the stimulation you mention was too great. There is no advantage in getting a two-year-old tree the size of a four-year-old. It postpones the fruiting usually and gives you a tree likely to break to pieces when it does set fruit.

CALIFORNIA WEATHER RECORD

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending December 8, 1919.

Stations—	Rainfall			Temperature	
	Past Week	Seasonal To Date	Normal To Date	Highest	Lowest
Eureka80	5.84	11.51	58	36
Red Bluff	1.12	2.50	6.64	56	36
Sacramento	1.31	2.31	4.44	56	34

Farmers' Union Wants Japanese Excluded

Written for Pacific Rural Press by R. E. Hodges.

STRAIGHT FROM THE SHOULDER," and with little hesitation, several body blows were given to existing evils in our agricultural life by the Farmers' Educational and Co-operative Union of California at its convention in Oakdale, Stanislaus county, December 2-4, 1919. This organization, which seemingly has languished of recent years in California, is becoming very lively and is not hesitating to take a strong hand in the urgent questions facing California agriculture today. Its membership has increased twenty per cent during the past year, as reported by President J. J. Hardie. The farmers' part in the Industrial Conference, recently called by President Wilson, formed the theme of an extended address delivered by President C. S. Barrett of the National Farmers' Union at its national convention recently in Memphis. This address was read by Secretary Fred Millard of the State Union. The Japanese question received firm, fair and appropriate treatment. The activities of the State Department of Agriculture, as told by Director Hecke, held the big audience for more than an hour. Affiliation with labor unions in solving the problems of industrial unrest and the wasteful high cost of living absorbed a great deal of the time spent in consideration of public questions.

Asiatic Exclusion Endorsed.

Opening the convention, Rev. F. C. Farr epitomized the sentiment of the convention in a forecast. He said that he liked the way farmers approach the Japanese question. They do not want to banish Japanese from the earth, but they do want to keep out from our country all nationalities which admittedly cannot be assimilated into real American citizens. Senator J. M. Inman, president of the Asiatic Exclusion League, made one of the leading addresses of the convention in much the same spirit. He said that there is no need of abusing the Japanese—they stand convicted by their own utterances and by their own well-known and less-known practices and ambitions.

Japanese Colonization of California.

There is immediate danger and plenty of evidence that they will accomplish the colonization of California within a short period unless fundamental preventive measures are adopted without delay. "Picture yourself owning and living on a ranch, with Japanese owning or leasing the ranches on both sides of you, and figure out how soon you would 'blow' off that ranch with your family."

Showing a picture of the Florin school with the Japanese children comprising 71 per cent of all the pupils, Senator Inman asked the Farmers' Union members to picture their own children outnumbered in their schools by aliens incapable of becoming Americans.

Have They a Right to be Offended?

Efforts to curb aliens ineligible to citizenship first took form in 1907. The Japanese government bluffed our Governor and State Legislature then, and again in 1911. In 1913 the entire Legislature, in executive session with Governor Johnson and U. S. Secretary of State W. J. Bryan, was told by Mr. Bryan that it must not pass the Japanese legislation for fear of offending a friendly power. Governor Johnson replied that the question was not whether we would offend the Japanese, but whether they had any right to be offended. Japanese, or any other foreigners, have no rights except what we give them. They may reasonably expect the protection of our laws; and tolerant Americans generally give them more than that. So much for the fairness of exclusion.

The Menace at First Hand.

"I have but recently returned from Japan, where I lived for six years," writes a courageous woman now living in California. "My information has been gleaned mostly from the boys

and girls whom I was teaching English. Not from what grown folks tell me, but from the naive chatter of youths and children, can one ascertain what is being taught in schools in Japan. They are taught that they, being children of the 'Son of Heaven,' are superior to all foreigners and that their natural destiny is to bring all other peoples to subjection. They are all quite sure of the 'promised war' with America." The teaching of children today becomes the established fact of tomorrow; and Japan only waits the day to test America's strength. She will test the strength of the nations to the utmost in order to force the world to recognize her people as equals. The moment she accomplishes this, the end of the white man is in sight. When Japan has taken sufficient iron from Shantung; when she has amassed enough wealth from Siberia; when she has stored enough chemicals from Germany and China, Japan's day will have arrived. It has taken only forty years for Japan to push her way into a world power of the first class. How long will it take her to make ready for her day?"

It sounds like "der tag" of the Huns, from the "Son of Heaven" to the preparations for war.

"We can't avert the war. The causes are too well established. But we can

tries, recently told the American Legion: "Every Japanese born in America legally is an American citizen; divinely he considers himself a part of the Government of Japan ready to strike against his legal home at the word of the Mikado, the Son of Heaven, whose word is law and whose acts are infallible; others may err, the Mikado never! Such fealty to an infallible leader—this is the peril facing America."

More, much more, was said to show the success of Japanese in begetting American citizens to acquire our land and control our industries, finally to control our laws and our civilization.

Besides adopting the resolution set forth in the panel accompanying this article, the Senator proposed that National legislation was a necessary aid to State legislation, as follows:

1. Cancellation of the Gentlemen's Agreement." This agreement was entered into for the avowed purpose of keeping Japanese labor, skilled and unskilled, out of Continental United States. Its letter and its spirit are being grossly violated. Even if they were not, the fact that the Japanese population of the United States has increased six-fold since 1900, while the Chinese population has decreased over one-half, is sufficient proof that the agreement is not filling its avowed purpose of Japanese exclusion, and

Early Consideration of Japanese Problem Requested.

The Farmers' Educational and Co-operative Union of California, at its recent convention at Oakdale, Stanislaus County, adopted the following unanimously by standing vote:

Whereas, (1) Our recent study of the Japanese question in this State has convinced us of the evils from continued Japanese immigration; and (2) we realize that if this condition is permitted to continue it will inevitably lead to the absorbing of communities and industries by the Japanese; and (3) we further realize that the white race is helpless against the economic competition and high birth rate and unassimilable character of the Japanese; and (4) we realize that this evil can be checked to a great extent by appropriate State legislation; and (5), we are convinced that the people of this State have sufficient information concerning this question to justify them in calling upon the proper State officials for the enactment of such legislation as may be required;

Resolved, That we, the Farmers' Educational and Co-operative Union of America, California Division, in convention assembled this 3d day of December, 1919, ask Governor William D. Stephens to call a special session of the legislature at the earliest possible moment for the purpose of considering this question and enacting such legislation as may be deemed advisable tending to relieve the present situation.

avert some of the loss that will otherwise be ours, by driving the Japanese out now; by taking command of our own food supply and of that strong right hand of the navy, the fishing fleets which are the mine-layers and mine-sweepers in time of war. Our fishing fleets are entirely in the hands of the Japanese and practically controlled by them in Southern California. We are spending millions for a great naval base at Honolulu. There we have our fleet and 12,000 of our people, and a Japanese-manned fishing fleet ready to strew their mines before our war vessels, and 120,000 Japanese all more or less trained in the arts of war, at the rear of our tiny army. Remember that Japan sunk the Russian fleet before war had been declared."

A Japanese clergyman says, "In 1933 the Japanese will control the situation in Honolulu, an American city." The "Japanese-American," a Japanese paper of San Francisco, says: "I firmly believe that it is only by propagation of the great Yamato race that we can solve the anti-Japanese problem. For the next ten, twenty, fifty, or one hundred years—Beget, Beget! (Senator Inman has observed five children under school age in one Japanese home.) The American people have suddenly changed from opposition to Japan to fear of Japan."

The editor of the Japanese "New World" derides the efforts of the California Legislature and adds, "Even the laws of California are not forever unchangeable. The day will come when the real strength of the Japanese will make a clean sweep of all such laws."

Capt. F. B. Whittemore, who has spent many years in Oriental coun-

that it should be abrogated.

2. Exclusion of "picture brides." They are being used for breeding purposes in carrying out Japan's clearly defined policy of "peacefully penetrating" the United States.

3. Rigorous exclusion of Japanese as immigrants. Let us follow in this matter the example set by Canada and Australia, and keep them out.

4. Confirmation and legalization of the policy that Asiatics shall be forever barred from American citizenship.

5. Amendment to Sec. 1, of Article XIV of the Federal Constitution providing that no child born in the United States of foreign parents shall be considered an American citizen unless both parents are of a race that is eligible to citizenship.

It is certainly inconsistent to concede that a Japanese who comes to this country at one year of age is undesirable material for American citizenship, and yet confer such citizenship unasked on the Japanese who is born here.

Mr. Inman said the Legislature had asked the Governor to call a special session, but the Governor objected that he did not yet have enough facts. State Director of Agriculture G. H. Hecke later said that California must be cultivated by the Caucasian race and the Governor was collecting facts which would result in announcement of a definite policy in due time.

Farmer—Labor Alliance.

Of interest equal to the Japanese question was the one in regard to alliance with labor unions. Commonly at the convention, it was said that such an alliance worked fine locally, but a national affiliation was not de-

sired. It was admitted that the "Triple Alliance" of Farmers' Union, State Federation of Labor, and Pacific Co-operative League had not functioned very actively. But the idea of producers and consumers of farm products getting close enough together to eliminate wasteful middlemen was uppermost in everybody's mind.

Judge Griffin of Modesto pointed out that there are two major groups in America—farmers and laboring men. All other groups, including financiers, business men, professional men, etc., depend for their prosperity on the prosperity of the two major groups. All proposed legislation should be considered with reference to its effect on farmers and laboring men. The interests of these two great groups are in the long run practically the same, and what is best for one is best for the other. The high prices of farm products are not due to the delicate appetites of financiers—they are due to the husky appetites and big families of laboring men when they are prosperous enough to buy farm products in quantity. It is to the farmers' interests that laborers should have fair working conditions and wages.

President D. J. Murphy of the California Federation of Labor stated that the efforts of organized labor to get increased wages were always four or five jumps behind the increasing cost of living, and there seemed no end to the circle except for all groups to get together. It is realized that no group can get ahead permanently at the expense of other groups. All affairs of the nation should be run by representatives of all the groups.

Save the Progressive Constitution.

Secretary Paul Scharrenberg of the same organization pointed out that no labor law covers the farmers because the farmers asked to be excused. There is a useful two-thirds in America who are kept at odds with each other by a very astute one-third which fattens in the process. Perhaps the biggest reason for farmers and laboring men to get together right now is the probable Constitutional Convention which looms in the near future. Without co-operation of farmers and laboring men, that constitution will become a reactionary instrument and we may lose the reforms for which we have fought in recent years. There will be an effort to get rid of its progressive elements.

Graduated Land Tax.

The stability of the nation depends largely on farm-owners who live on their farms. We are drifting away from that condition. The Bureau of Immigration and Housing found that over half of the land in eight counties of Southern California is owned by 274 people. The Federation of Labor and the Pacific Co-operative League had adopted a platform which was presented to the Farmers' Union for endorsement. One of its planks is a graduated land tax which will discourage large holdings and encourage farm-owning farm-operating farmers.

The Japanese question originated in the cities as did the Chinese question, but now the former is more of a farm question which will need the help of labor to solve.

Employment Agency Fees.

School teachers now have to pay \$30 to \$100 to a private employment agency to get a job which ought to be furnished free by the State Board of Education. One of the planks in the platform mentioned is to limit the fee to be charged by any private employment agency to 10 per cent of the first month's pay.

University Regents Represent? ? ?

The State University is paid for by all the people, but is governed by a board of Regents appointed for 15-year terms. There is no adequate representation of wage-earners or farmers on that Board.

The Bee and Orange Combination

The orange tree furnishes two liberal crops; first a generous flow of nectar, which if bees are present to harvest it may be stored up within the hive in the form of honey, and later a crop of fruit, says Frank C. Pellett in the American Fruit Grower. It has only been within recent years that the fruit growers generally have come to appreciate fully the importance of the presence of bees in large numbers in the orchards at blooming time. Many experiments have been conducted with various fruits to determine to what extent the pollination is dependent upon the honeybee. In most cases it has been shown that while under favorable conditions a fairly good pollination is effected by wild bees, the honey-bee is the only agency which can be controlled to the extent of insuring their presence in sufficient numbers to accomplish the desired result.

If weather conditions continue favorable during the entire period of blooming, a much smaller number of insects will be able to carry the pollen from flower to flower until enough are fertilized to insure a profitable crop. When, as often happens, especially with apples, weather conditions are unfavorable with only now and then a few hours when insects can be upon the wing, it is important that they be present in very large numbers if a full set of fruit is to be insured.

Value of Bees.

However, the time has long passed when argument was necessary to convince the progressive fruit grower of the value of bees in his orchard. The live question of late, is how to get the bees at the proper time. In many apple-growing sections the orchard-

ists are either establishing apiaries of their own or making some inducements to commercial beekeepers to locate bees in their orchards. These apiaries usually remain in the same location throughout the year.

In the California orange groves, however, there is usually sufficient forage to support the bees a limited time only. While the orange secretes nectar very freely during its period of bloom, it becomes necessary to move the bees to other fields as soon as the blooming period is over. Migratory beekeeping is the common thing in California and the man who keeps his bees in one location throughout the year is rather the exception than the rule. Some of the extensive beekeepers move as many as three or four carloads of bees to the orange groves for the spring crop. This moving is very expensive but the returns under favorable conditions are such as to make it profitable.

Strong Colonies in Spring.

The great difficulty with the beekeeper is to get his colonies sufficiently strong to store surplus so early in the season. Some beemen take their bees to the orange in a weakened condition and build them up on the orange flow while harvesting little surplus. Even this is a profitable arrangement for both fruit grower and beekeeper. The presence of the bees serves the purpose of insuring pollination, while the bees build up in fine shape for the next honeyflow. However, when the great possibilities of surplus honey from a good orange flow are considered it falls far short of the ideal. More and more are the better beekeepers wintering their colonies with a large reserve supply of

honey to enable the bees to start brood-rearing earlier in the season. By this means they are able to get the bees built up in advance of the flow from orange and thus harvest a good crop of surplus honey from this source. It is only the strong colonies of bees which store the big crops, and it helps the beekeeper but little if his colonies become strong after the flow of nectar has ceased.

The flow from orange is remarkable at times. The nectar is secreted in such abundance that horses and men at work in the orchards are drenched with it. According to California beekeepers with whom the writer has talked, it lasts about three weeks, sometimes slightly longer. It takes 21 days from the time the egg is laid for the worker honeybee to reach maturity, and several days more elapse before she goes to the field to gather nectar. It will thus be seen that the beekeeper who comes to the orange flow with weak colonies cannot rear young bees in time to profit much from the nectar available. To quote George De Muth of the U. S. Department of Agriculture, he rears his bees on the honeyflow, instead of for the honeyflow. For this reason but a small part of the possible honey from orange is ever harvested.

Some Honey Records.

In 1918 a beekeeper near Porterville extracted 171 pounds of orange honey from one colony in ten days' time. In addition more than half as much more was extracted before the flow was ended. Four hundred colonies of bees in one yard averaged sixty pounds each of surplus from orange.

A flow of nectar of this kind is sufficient to induce a beekeeper to move his bees a long distance. Some California beemen move three to five times in a year. One man moves from the almond belt to orange. From there he moves to the Sacramento or San Joaquin valleys where seeds are grown commercially and later again moves the bees to the alfalfa fields. While the honey crop is never certain, there are few years that the beekeeper fails to get a profitable return from one or more sources, where so many are available.

The interests of the beekeeper and fruit grower are mutual. Without the bees the nectar becomes a waste product, doing nobody any good. Not only this but the pollination of the fruit trees is never certain without their assistance. The prosperity of beekeeper and fruit grower are therefore interdependent. While at times their interests clash, there is a growing tendency for each to appreciate his dependence upon the other and manifest a willingness to meet the other fellow half way. The time has long past when indifferent methods at either fruit growing or beekeeping succeed. Each is a highly developed specialty requiring the most expert attention for best results. With better methods comes greater prosperity to both.

Fertility of the farm means more success in farming, and this fertility depends upon the proper use of fertilizers. Manure, both liquid and solid, should be taken care of carefully and hauled to the fields often.

FREE—New Book on Fruit-Fog Spraying!

Every fruit grower should send coupon for the book. Read why Fruit-Fog, the scientifically atomized super-spray, is the ONLY spray fine enough to seek out and kill the hidden pests—millions of which infest the microscopic niches in bark, buds, and foliage where no coarse spray can reach. The book explains why this amazing Fruit-Fog thoroughness is adding fortunes to fruit growers' profits each year. Send coupon now.

HAYES FRUIT-FOG SPRAYERS

Fruit-Fog spray is produced by Hayes 300 lb. high pressure and the scientific Hayes nozzle. Its vapory fineness gives it wonderful adhering power. No drops form—no solution wasted—no buds or leaves knocked off—as with heavy, coarse, low-pressure sprays. Fruit-Fog Sprayers are skillfully made in every part to give enduring service and greatest efficiency under high pressure. Service stations all over the U. S. assure new parts within 24 hours in case of accident. The Fairbanks-Morse famous "Z" Engine means supreme engine satisfaction.

The Efficient Direct-Connected Motor-Driven Pump —with Water Seal

The Bean Spray Pump Co., a concern with 36 years' reputation behind it, offers a pride-product in this outfit.

It is built to eliminate pumping troubles, and deliver the largest possible volume of water at a minimum expense.

The motor is staunch and reliable—the unit is compact—and the pump is the best of the centrifugal type that has ever been developed.

Water Sealed—Water Balanced

Stuffing box troubles are prevented by a generous water seal. The shaft is completely surrounded where it enters the case. Loss of priming is minimized. The packing need not be cinched down so it cuts the shaft.

(Clip Out and Mail)

Fine Valencia Orchard in Tulare County

(Written for Pacific Rural Press by D. J. Whitney.)

Valencia orange trees are naturally alternate-year producers as are some other fruits; that is, a big yield will be followed by a smaller yield, that by a big yield again, and so on, unless unfavorable weather or other conditions step in. Last season was the low year on one of the oldest and finest Valencia orchards near Lindsay, but in 1918 21 1/4 acres brought in \$34,072.44, and it now has a crop coming of similar size—whatever prices will be. This year the returns were \$17,000, round numbers. This orchard is 23 years old and was planted the second year of Tulare county's citrus development. For the past five years the ranch, of which the Valentias are

merely a part, has been managed by McKee Mhoon of Lindsay.

It is on sandy loam 10 feet deep, and it is irrigated with approximately an inch of water per acre. For several years back, 10 tons of stable manure, costing \$4.00 per ton, has been applied per acre every other year; also a half-ton of commercial fertilizer. Recently the amount of commercial fertilizer used has been greatly increased. Steamed bone meal and tankage are especially favored for commercial fertilizer.

Like most early plantings part of the Valentias are only 20 feet apart, and so are crowded. A couple of years ago Mr. Mhoon tried taking out half of the trees on part of the orchard, removing alternate trees on alternate rows, and the yield per tree on this part was not only much greater, but the yield per acre was increased. No comparative records were kept upon this matter, but more boxes seemed to be pulled out than on the rest of the place. The skirts of the uncrowded trees were well filled with fruit; and before, this part had been too shaded to have much of anything upon it. Low fruit is high quality fruit and a good set there means a heavy yield.

This orchard has what is considered the bonanza tree of the variety. Naturally, it is a border tree, where it has plenty of room; but most of the trees around it are good too. Last year it bore 24 boxes; 22 boxes in 1918; 12 boxes in 1917; and 15 boxes in 1916. It is a very large tree and has a tremendous bearing surface.

SETTING TREES STRAIGHT.

(Written for Pacific Rural Press.)

One of the finest looking orange orchards in the district in which it is located had a peculiar start. The owner wanted things done right and had the rows staked beautifully—in perfect line in every direction. Next, he had the greatest care taken to have the trees set exactly in the place of the stakes. Then he had a stream of water run down each row to settle the dirt around the trees, just as was required. But—as the dirt settled when the water went around it, the trees bent this way and that way until they were a terrible looking lot, and he was too busy elsewhere to have them straightened until it was too late to straighten them. For two years the rows were an eye-sore, but as the branches grew and drooped the slope of the trunks was hid and now nothing can be seen but trees a man could be proud to own. With most fruit varieties the irregular slant of the trunks would still be apparent.

Moral: When starting a young orchard don't do two jobs well and neglect a third, but look after every job. Be sure in particular that if you get the trees lined well, the settling irrigation does not undo your labors.

PLANTING FRUIT FOR SUCCESSION OF RIPENING.

(Written for Pacific Rural Press.)

In planting an orchard, it is well to consider a succession of fruits which will keep the same-sized crew busy from early summer until fall. Thus one family may care for quite an orchard. Mrs. E. V. Coleman of Stanislaus county has sixty acres, most of it planted many years ago, which illustrates this point. A few cherries and "French" apricots are first to be harvested here. When they have been dried, Crawford peaches were ready, but these have been taken out. Muirs followed the Crawfords, and Salways then came on for canning or drying. Sugar prunes are being put on a block to just precede the French prunes. Nonpareil, Ne Plus, and Drake almonds come in the order named along with the French prunes. Olives follow them and are being picked as this is written. For picking and drying equipment, 2,400 boxes and 3,600 six-foot trays have

been ample. Three horses do all the work with occasional extra hired horses. The succession has proved

very satisfactory from the standpoint of keeping a moderate-sized crew busy the entire harvesting season.

[This is one of a series]

Dead Top and Die Back

A varnished horse would soon die.

A tree sprayed with a material Leaving a sticky, gummy, non-porous residue, Or caustic deposit year after year, Will feel the effects sooner or later; Its proper functioning is arrested, Or its bark is hardened and "bound".

ZENO

Leaves no residue, and at the same time Softens the bark and cleanses the tree—

The result is a more vigorous, resistant tree; Better fruit and more of it.

ZENO

Is an internationally used Miscible oil spray, and these are reasons why It has proved the best by years of test.

Olene is the Citrus Spray

SULPHUR

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for

bleaching purposes, LEAVING NO ASH. VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Sulphur.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this Sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out in labor for spraying your orchard, even if you pay your men \$4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100% pure. This has increased various crops up to 500%.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur Mixtures, etc., and "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 deg. Be. Fungicides and Insecticides. Carried in stock and mixed to order.

Send for "ILLUSTRATED BOOK-LET", also booklet "NEW USES FOR SULPHUR." Price-list, and Samples.

TOP DRESSING TALKS, NO. 2

Feed Your Wheat

"Sulphate of Ammonia was applied to the growing grain on February 11th at the rate of 200 pounds per acre and the yield of wheat was increased from 822 pounds per acre to 2,114 pounds per acre: an increase of 157 per cent."

The above is an extract from California Experiment Station Circular No. 172. The results of this Station's investigations for several years past have shown that the depleted yields of wheat on continuously cropped lands are due to a lack of sufficient available nitrogen.

For greatest profits top dress all crops needing nitrogen with the great American Ammoniate.

ARCADIAN Sulphate of Ammonia

It is the only safe and economical carrier of nitrogen for California soils. It does not injure the physical condition of the soil.

Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past.

Arcadian is the kiln-dried and screened grade, made fine and dry for top dressing purposes. Ammonia 25 1/4 % guaranteed. Made in U. S. A.

DO YOU INTEND
PLANTING THIS
SEASON?

If so, you should place your orders at once. The demand is heavy and many varieties will be scarce.

We specialize in fruit-bearing trees and our Catalogue contains very complete descriptions of all the best known varieties.

Let us know what you are thinking of planting, character of the soil, water, etc. We are always glad to answer questions or to advise with planters as to what is best suited to their soils and localities.

Is Nursery Stock Scarce?--Plant Alfalfa

(Written for Pacific Rural Press.)

As a result of war conditions, the supplies of most kinds of nursery stock are so limited that many persons who would like to plant fruit trees will be unable to do so next spring unless they have been fortunate enough to get in their orders early. In spite of that fact, there is still the possibility of substituting alfalfa, not as a permanent crop, but as a preparation for fruit, in a way that may mean bigger dividends in the long run than immediate tree planting.

For example, at the Fresno Farm Bureau picnic, a group of fruit men were discussing raw land and one mentioned that well leveled new land near him was selling at \$200 per acre, but that the same kind of land in alfalfa was selling for \$300 per acre. The price in each case was based on its value for trees or vines. Wylie Giffen, head of the Raisin Association and a very extensive rancher, remarked: "I would say that the alfalfa land was a better buy at \$300 than the new land at \$200." The chorus echoed, "You bet it is."

Therefore, if a person cannot get the nursery stock he wants, common sense suggests that he will add a full \$100 per acre to the value of his land by planting alfalfa as soon as possible and plowing it under in the winter of 1920-21 before tree planting time. Forgetting about what the alfalfa brings in during the summer, the increased fertility, the way the roots will have opened the soil deeply, and mellowed it up, it will be like making \$100 per acre, less expenses. In addition, the more rapid growth of the trees or vines, on account of the increased soil fertility, will nearly make the later planted trees catch up with the early planted trees on raw soil, so the income will be nearly as quick in coming after all.

There is also the alfalfa crop of the summer to add profits to permanent value. Fall planting on good land

would have given nearly as much hay next year as a two-year-old stand. Early spring planting may run only two or three tons short, depending upon location, care, and the nature of the soil. The yield certainly ought to be enough to pay all expenses, including labor, and some profits besides. Where growth is slow in starting there is all the more reason for putting some life in the soil by growing a deep-rooted legume like alfalfa.

Also, the proposition of growing alfalfa in an orchard is meeting more and more favor. With this in prospect it would be feasible to plant the orchard land solid to alfalfa, irrigating in the direction of the rows, then next year, before planting the trees, plowing a strip eight to twelve feet wide where the trees are to be planted, throwing the soil toward the center to make levees, with the dead furrows where the trees are to be, harrowing and cultivating to get the soil in nice shape before planting.

In many orchards it is the rule, instead of checking up, as one would do in a regular alfalfa planting, to lay out deep furrows down each tree row and irrigating through them. Sow the seed and harrow it in, then as the last thing, run the furrows. These furrows flatten out in time, but still carry the water nicely. Irrigating is done exactly the same as in a cultivated orchard, only no cultivation is needed. Mowing the alfalfa is more difficult than without these furrows, but under any conditions it is harder to handle alfalfa in an orchard than in the open.

Whether it is planned to keep alfalfa in the orchard or not, the good that alfalfa does to the soil, and the income it gives in the meantime, make it well worth while figuring on putting out alfalfa where trees are to be, in those places where no trees can be secured for a year.

Walnut Growers' Spray Company

(Written for Pacific Rural Press.)

The codling worm and walnut aphids have been spreading from district to district. If they haven't reached your section, the most profitable insurance you can take out is to join all other walnut growers in an effective campaign to control these pests where they exist already. This is the philosophy of the California Walnut Growers' Association in asking its affiliated local organizations to subscribe pro-rata for stock in the "Walnut Growers' Spray Mfg. Co.," which is to have the same board of directors as the Association. Since the sales department obtained better prices than they expected for some walnuts which were still on hand when final settlements for last year's crop were made with the Associations, they have \$25,000 on hand for which they have no specified use other than to distribute pro rata to the locals. They now propose to make it easy for the local associations to subscribe for stock in the spray company by suggesting that each one take a block of \$10 shares to equal its proportion of the unexpected \$25,000 surplus. So the new enterprise will cost the growers nothing, from one viewpoint. Its authorized capital is \$50,000, but the \$25,000 already on hand is believed to be enough for present purposes.

The spray company is to manufacture dust sprays under the superintendency of Prof. R. E. Smith of the University of California, who developed this system of controlling walnut pests. He has been making various

dust sprays for experiment and commercial use, especially with reference to aphids, with a mill of seven tons' capacity per day in the Goleta Walnut Growers' warehouse in Santa Barbara county. It is considered certain that next season a great deal more than twice as much dust spray will be used as ever before. To provide it requires enlarged capacity. The Goleta people need their floor space and freight is unnecessarily burdensome to and from that point for dust spray purposes. So the new project is getting quarters large enough in Los Angeles to take care of any immediate growth in the demand. The Goleta machinery has already been shipped.

Dust sprays are to be sold to everybody, the outsiders paying a price that will reduce the cost to members of the Association. The codling worm has not yet proved controllable by this method, but there is reason to expect next season's work to show satisfactory results. The same is true of red spider. And there is a possibility of finding a way to control walnut blight.

Similar materials will be manufactured for use of vegetable growers who are troubled by aphids, thrips, etc. Since nicotine sulphate seems the most promising and effective property of the sprays, Prof. Smith hopes to start some tobacco growing in Southern California to provide one of the raw materials for the new spray.

WHICH ZANTE CURRANT DO YOU WANT?

There are two common varieties of Zante currants, the black and the white. The Service Department of the California Associated Raisin Co. points out the superior quality of the Black Corinth and the better demand

—two reasons for recommending this variety. All growers interested in Zante currants of any variety should send their names to the Raisin Co., or to the U. S. Department of Agriculture at Washington, D. C. The Department will shortly issue two bulletins on cultural information that will help greatly in making this new grape profitable in California.

STRAW A VALUABLE FERTILIZER FOR ORCHARDS.

(Written for Pacific Rural Press.)

Wheat straw in large quantities is being purchased by the noted Merryman fruit ranch in Tulare county from a grain grower in the vicinity for the sake of the way it can be used to provide fertilizer. Its value is such that a price of \$8.50 a ton, delivered, is paid for it.

This straw is first used for bedding in the stables and then hauled out in the orchard. In this way the fertilizing value of the liquid manure is added to the plant food in the straw and the liquid manure helps to rot the straw too. New bedding is put in the stables every afternoon and the stalls are cleaned out the next day. None of the liquid manure goes to waste under this method, and most of the potash and a great deal of the nitrogen that would otherwise be wasted is saved. This is considered of such high value that hay would likely be used as bedding if straw or other cheap stuff was not available.

Fertilize in Furrows.

The method of using barnyard manure on this ranch is to apply it in deep furrows, where it will certainly get to the roots and loss of ammonia in the air will be prevented. A lister on a subsoiler is run down and back in a tree row, making two furrows from 14 to 20 inches deep not far from the drip of the tree, and the manure as it comes fresh from the stable is thrown right in this furrow. The dirt is then thrown back upon it, either with a plow or an inverted V, and quick and complete decay takes place.

One of the main troubles with broadcasting fertilizer in orchards is that the plant food stays too close to the surface where the tree roots cannot reach it. By the method used here the roots can get everything.

An immense amount of barnyard manure is purchased by this ranch, in addition to what is secured from the ranch livestock. As much as 20 tons per acre is put on at an application.

The furrow system of fertilization has proved a great success in developing new growth and strengthening the trees. It has proved as good in practice as in theory, and after all, results are what counts.

INTEREST IN PITTED PRUNES.

(Written for Pacific Rural Press.)

Pitted prunes have never become so popular as seeded raisins, though they have been on the market at least a decade, according to Geo. D. Gilman, Santa Clara manager for Guggenheimer Co. His firm and Rosenberg Bros. began pitting prunes about 1908 or 1909. One firm pitted a lot and lost heavily because the fruit soured.

Better methods seem to have been found, however, for something around 100 to 200 tons a year have been marketed in this form ever since. Last year the business increased greatly on account of the Government demand. Some of the prunes pitted then are still in Mr. Gilman's possession, in good condition. Most of them generally go into immediate consumption. Not many except the smaller sizes are pitted, and the chief reason for the process seems to be to help market the small prunes. The loss in weight is estimated at only 30 per cent on the 80-90 size. The California Prune and Apricot Growers, Inc., have announced that they intend to put in the most up-to-date machinery for this purpose. Perhaps with their advertising campaign, consumption of pitted prunes will be greatly increased.

PEAR TREES MADE TO BEAR EARLY.

Fruit spurs were encouraged on young pear trees grown by W. A. Caldwell of El Dorado county, so that at five years old the trees bore an average of 2½ boxes per tree; and last season at six years old they bore three boxes average of standard Bartlettts. The system is to bend the canes over and tie them there when the trees are two years old and thereafter. This checked the sap from its vertical career and induced fruit buds and spurs to start much earlier than normal.

It Excels in Orchard Work

ORCHARD work demonstrates the unusual adaptability of the Bates Steel Mule.

Fact is, that California fruit growers pronounce it the ideal tractor for orchard cultivation.

Its design is low and narrow, allowing the tillage of the soil close up to the trees without a chance of injury to the low hung branches, and the short turning radius of only 16 feet enables a thorough cultivation of the ground.

The Bates Steel Mule with its Crawler type of traction will not pack the ground as its ground pressure is but 3½ pounds to the square inch.

Think what this advantage means in your orchard.

We have an interesting and instructive catalog which will be mailed you for the asking. Write for it today.

Warehouses for Grain Sorghums

(Written for Pacific Rural Press by Manager Geo. H. Emery, Alfalfa Growers of Calif., Inc.)

That many of the most important and productive sections of California where Milo Maize and Egyptian Corn are grown will have extensive warehousing facilities for taking care of these two crops during 1920, is the present indication from advices reaching officials of the Alfalfa Growers of California, Inc., with headquarters in Los Angeles.

Growers of grain sorghums throughout the State have felt the necessity for warehouses for the proper care of their crops after harvesting, for years; and during the last few months definite action has been taken by growers in several sections to establish permanent warehouses in such a way and in such locations as will benefit the greatest number of growers in each district.

The warehousing move is being given every encouragement by the Alfalfa Growers' Association, not only among its own members, but among all growers of Corn and Maize, in the interest of increasing the annual yield of these two crops and of steadily improving the grade of both the Corn and Maize.

It is pointed out that consumption

of grain sorghums, as produced in California, is practically constant. On the other hand, production is seasonal, and therefore it is highly important that the growing sections of the State have storage facilities that will permit the maintenance of sufficient stores of these crops to meet the demand of consumers during those seasons of the year when neither Corn or Maize are being harvested.

The growers point out, as one of the advantages of a system of warehouses owned and operated by themselves, that such a move will permit the handling of the crop each year on the most economical basis possible, and will tend greatly to eliminate the middleman's profit and to stop speculation in these two crops on the part of food speculators.

It is for this reason that officials of the Alfalfa Growers of California are encouraging the construction of warehouses for grain sorghums among their membership, as the Association is a non-profit organization interested only in increasing crop production and bettering the grade of products grown, together with the elimination of food speculation in these crops.

Co-operative Store Makes Good Money

(Written for Pacific Rural Press.)

The increasing H. C. L. has lost some of its terrors for the citizens of Riverbank, Stanislaus county, and farmers in the surrounding country. Their "Producers' and Consumers'

Co-operative Store" has just cut a melon of more than \$590 dividends to its patron members, dividing it pro rata according to the amount purchased by each. The poor man with a big, husky, hungry family that wears out shoes, etc., like ice cream melts on a hot day, gets the biggest part of the dividend, because he has bought more from the Store. The original investment when the Store opened July 28 was less than \$5,000. They are today about \$2,000 better off than when the store opened. They started with 100 members and now have 138. The original capital is composed of subscriptions by members not less than \$40 nor more than \$500 each. This investment gets 5 per cent interest out of the profits of the store. Then any surplus, not needed to enlarge the business, is divided on the pro rata patronage basis mentioned. But, regardless of capital invested, no member has more than one vote.

The Store buys everything for cash and sells everything for spot cash or cash in advance. It owes nobody and nobody owes it. There are no bad accounts. The cash business enables it to buy at lowest prices and gets all the cash discounts. Farmers bring produce of all kinds from hides to cauliflower and they frequently get much higher cash prices than they expect. When the store was organized, the merchants of Oakdale nearby were paying 46 cents in trade for eggs. The Co-operative Store immediately sent its motor truck out to gather eggs at 50 cents.

Railroad Men with Farmers.

The Riverbank Farmers' Union, under the presidency of T. Birnbaum, was talking of a co-operative store. The railroad men's unions of Riverbank also realized the need and they joined in carrying out the project. Officials of the Store are President L. H. Collett, Secretary-Treasurer E. P. Condrey, and Manager Jos. Trevelli.

A strange type of alga, which forms a perfect Maltese cross, has been found on the water in the rice fields. According to Lieutenant W. C. Purdy, in charge of malaria control, this is a new form of alga which has never been revealed in investigations carried on by the United States Public Service. The purpose of so detailed an investigation in the rice fields is to ascertain why mosquitoes do not breed in Butte rice areas when they breed in Louisiana and Arkansas rice fields under like conditions.

Cotton from the Tagus ranch in Tulare County is being shipped in carloads to Los Angeles unginned. Their 860 acres are expected to yield over a bale per acre.

DORMANT SPRAYING PAYS

Dormant spraying, it has been proved, is the most successful means of controlling many injurious diseases and insect enemies. Fruit trees at this time, devoid of foliage, are hardened for the winter and can withstand applications of strong sprays.

UNIVERSAL BRAND CRUDE OIL EMULSION

properly applied, prevents the accumulation of insect and fungous enemies. It keeps the trees in better health, vigor and fruitfulness. It cleans the trees and disinfects bark wounds.

Crude Oil Emulsion is the best of the dormant sprays—made for this purpose. Place your order with us for your supply—today.

And send for your copy of our bulletins on deciduous spraying. A post-card brings it—today.

The **49**er says—
"the genuine **GIANT**
dates back to
1866"

"I remember well when we used black powder for stump blasting and mining. Just after the Civil War the first Giant Powder ever made in the United States was manufactured in a little laboratory in what is now Golden Gate park.

"Out of that beginning has grown The Giant Powder Co., Con., with its chain of great plants and magazine stocks throughout the entire West. And the Giant Farm Powders are being used for stump blasting, boulder blasting, tree planting, etc., by thousands of Western land owners. Giant Powders have always been so popular that some people have thought any ordinary dynamite was Giant Powder, but that is wrong. The only way to get Giant economy and efficiency is to get the genuine Giant Powders made by the originators of the name.

Just tell us "send me your book," and we will mail you our valuable guide to blasting, "Better Farming with Giant Farm Powders."

Fresno Vine Pruning Demonstrations.

Vine pruning demonstrations will be held in Fresno county by Prof. L. O. Bonnet and A. E. Way as follows: Caruthers, Dec. 15, 9:15 a. m. in N. P. Hammond's vineyard; Raisin, 1:30 p. m. in Hildebrand vineyard; Selma, Dec. 16, 9:15 a. m., Edward Dudley vineyard; Clovis, 1:30 p. m., Geo. A. Cate vineyard; Fowler, Dec. 17, 1:30 p. m., Cecil Feaver vineyard; Bowles, Dec. 18, 9:15 a. m., G. A. Pell vineyard; Kingsburg, Dec. 19, 9:15 a. m., C. E. Ericson vineyard; Reedley, 1:30 p. m., H. E. Wuerth vineyard; Easton-Oleaner, Dec. 20, 9:15 a. m., Thos. Rogers vineyard; Easton, Dec. 22, 9:15 a. m., J. A. Poytress vineyard; Kearney Vineyard, 1:30 p. m., 8 miles west of Fresno; and again Jan. 2 at 1:30 p. m.; Sanger, Jan. 12, 1:30 p. m., at Lef-fel's vineyard and 3 p. m. at Grand-raus vineyard. Sanger demonstration will be conducted by Prof. F. T. Bio-letto.

Barley Yield Doubled.

Alfalfa, beets, and irrigation made a difference of more than 25 sacks of barley per acre for W. J. Woodward & Sons of the South San Joaquin Irriga-tion district. He had three pieces of twelve acres each. One had never raised anything but grain. It pro-duced fifteen sacks per acre. Another

had been in grain until a year ago when a crop of sugar beets was raised. It produced between 20 and 25 sacks of grain following the beets. The other had been in alfalfa eight years, then in sugar beets one year. It pro-duced close to 50 sacks of barley per acre. This piece grew the heaviest straw and suffered most for water un-til it was irrigated while it was nead-ing. About one-third of an acre was lodged by the rush of irrigation water. But, say, even though it was not in very good shape for irrigation, that watering paid well.

Cantaloupes Netted \$1.17 per Crate.

Three hundred and eight thousand crates of cantaloupes were shipped this season by the Turlock Merchants and Growers, Inc., in the weekly pools which closed August 26, and about 40 carloads were shipped in later pools according to General Man-ager F. W. Hosmer. Prices on the first setting were the best, but the late pools brought better than the average which was \$1.17 net to growers f. o. b. Turlock. The second setting came in heavy while the strike was on in the East, otherwise the average would be much higher. The car shortage caused some loss.

Alfalfa Meal Favored.

Alfalfa meal seems to be increasing in local importance. One firm at Man-teca has sold about 1,500 tons this season. A great deal went to Peta-luma, some to San Jose and some to one of the big milling companies. The No. 1 meal has recently been selling at \$35 per ton with alfalfa hay at \$25.

Alfalfa Land in Big Demand.

There is an insistent demand for alfalfa land at high prices in southern San Joaquin county, according to W. J. Woodward. Alfalfa seed is so scarce that many who expected to plant this fall and next spring will be disappointed and some of them are looking for stands already established.

Outworn Truck Tires are Expensive.

Tires are worth more to a truck than they cost because they take the sharpness out of most shocks. Use of old truck tires too badly worn to take these shocks will jolt the ma-chinery of the truck and probably make repairs cost more than new tires. Mileage gained on tires after they have served their usefulness is most expensive gain.

Which is the best tractor? It de-pends on your conditions.

"A half a mile of post holes is no joke when you dig 'em by hand—but with the help of dynamite it's a different story. Blasting the holes is a cinch and it saves more than half the work on a job like this. We've saved hundreds of dollars and days of back-breaking work this year by using

FARMERS' UNION RESOLUTIONS.

(Written for Pacific Rural Press by Secretary Fred Millard.)

At the Farmers' Educational and Co-operative Union Convention in Oakdale, December 2-4, resolutions were adopted as sketched below, in addition to the resolution printed elsewhere calling for a special session of the Legislature to enact Japanese legislation.

Following the suggestion of Mr. Hecke, in his address the previous day, the convention voted unanimously to appoint a representative on the general legislative committee from the farm organizations. L. Woodward of Campbell, chairman of the State legislative committee of the Farmers' Union, was appointed to serve in this capacity.

A resolution, urging the membership to support all co-operative business enterprises that tend to shorten the road between the producer and consumer, was adopted. The preamble of this resolution cited the Co-operative Store at Riverbank, and the Stanislaus County Farmers' Union as examples of true co-operation.

The action of the Government in continuing permanently its war loan thrift movement in the sale of thrift and war savings stamps and treasury saving certificates was endorsed.

A resolution was adopted expressing disapproval of the custom of using the public schools of the country to collect money for various purposes. This custom has become so general and the calls so numerous as to become a nuisance, inasmuch as it causes embarrassment to those patrons of the school whose financial position does not warrant their responding.

Other resolutions adopted urged our representatives in Congress to work for the passage of the Capper-Herman Bill, known as H. R. 7783: The appropriation by Congress of sufficient funds to enable the department of Agriculture to compile data on the cost of production of all food products, and that the Secretary of Agriculture shall make them available for the same calendar year; the enactment into law of the Kenyon Bill (S. 2202), providing for control of packers. The convention voted unanimously to oppose the Chamberlain-Kahn Bill, providing for the establishment and maintenance of a large army and navy in times of peace.

Among several recommendations from the national convention of the Farmers' Union recently held in Memphis, Tenn., and endorsed by the California convention are the following: An amendment to the federal farm loan act that will enable a man without a farm, but having an established reputation for honesty, frugality and industry to secure loans from the federal land banks up to 75 per cent of the appraised value of the land; that the secretary of agriculture shall be a practical farmer and that the endorsement of farm organizations should receive due consideration in the selection of men for that office; continuation of the highest rates of taxes levied during the war, on incomes, corporations and excess profits until the full cost of the war has been paid, and that the government levy a tax on the value of land and other natural resources held for speculation; reclamation of waste lands of all sections of the country for the purpose of enlarging the area of agricultural production; the rigorous enforcement of all federal laws to prevent the immigration of undesirable aliens; application of principles of co-operation as solution of marketing and industrial problems.

RHUBARB WORK.

To the Editor: How should we treat rhubarb plants now?—M. M. L., Owensmouth.

Transplanting may be done any time now, but avoid transplanting to waterlogged areas. On old stands it is a good idea to plow a furrow away from as close to the rows as possible without injuring the plants and apply as much cow manure as may be available. Plow the furrow back over the manure. Cut out all seed stalks if this has not been done previously.

Clean Plowing for Clean Crops

CLEAN plowing is the only kind of plowing the E-B 102 tractor plow ever does. It is the plow for clean crops.

It buries every spear of stubble—even on the driest, toughest soils of California. For this plow cuts deep enough to make a clean furrow slice, and the moldboard is shaped so as to turn the land clear over in a continuous, smooth ribbon.

The E-B 12-20 tractor and 102 plow can turn over the heaviest as well as the lightest soils. Together, they make an unbeatable plowing combination for an economical quality job.

The E-B 102 Tractor Plow

The shares on the 102 tractor plow can be changed in 5 seconds, without tools of any kind. The clean plowing of sharp shares is the mark of the E-B 102.

The weight of the plow is all carried on the wheels. Their bearings are dust-proof and anti-friction. And the E-B 102 is a one-man plow, easily operated from the seat of the tractor.

SOME SUGGESTIONS ON ALFALFA SEEDING.

(Written for Pacific Rural Press.)

For good reasons a large new alfalfa acreage will be put out in California before real hot weather comes again, and as seed is scarce, it has to be used wisely. One good rule is to put on as little as can be, although enough to make a good stand. If two pounds of seed were planted evenly over an acre and every seed came up a perfect stand would be secured. Unfortunately, a perfect distribution can not be made and a few seeds of the finest lot of alfalfa seed obtainable will not sprout, so enough extra always has to be used to fully overcome faulty seeding and faulty germination. Twelve pounds of high-class seed ought to be ample for broadcasting on properly prepared, properly handled land. A drill will do good service with as little seed as it can be adjusted to plant with proper spacing.

Last season on a big California ranch there was a fine illustration of the wastefulness of using too much seed. The foreman provided 15 pounds per acre and examined the ground carefully when the job of broadcasting was done. Seeing what he thought was too few seeds, he had the same amount put on again, and in a short time the field looked like a young lawn, the plants were coming so thick. To prevent overcrowding he had to have the field spring-toothed to pull up a lot of the young plants. It then looked like a wreck, but in a week it was as nice a looking young stand as a man could find. The extra seed and extra work was just thrown away.

Some people advise keeping the water off young alfalfa as much as possible in order to force the roots to go down. It is surprising how young alfalfa can endure with almost no irrigation. People who figured that their seeding was a failure have found they had fine stands in prospect a week after an irrigation. Checks of young alfalfa that seemed almost like a road have looked beautiful in a month.

Although this is so, it is wasteful and foolish to keep young plants half dead from thirst. The alfalfa might better be growing and making a good top and root too. The roots will get thick and long quicker when they have moisture than when they are suffering from drouth. As fine stands as can be found have been sowed in early spring, mowed for a light crop in June, and given nearly as heavy and abundant later cuttings as adjoining old stands. A great deal depends upon location, soil and care.

Under any conditions as light a seeding as will fully serve is satisfactory, and as much irrigation as will bring the field along quickly to production and strong growth.

GAS TRACTOR COURSE, FEBRUARY 23rd TO 28th.

Do you operate a tractor? Are you thinking of buying a tractor? Do you wish to learn something about gasoline engines?

Attend the gas tractor short course at the Citrus Experiment Station, Riverside, California, from February 23rd to 28th. You will learn the principles of the gas engine, how the valves and ignition should be timed, how to adjust a carburetor, and many other things which will help you to be a better operator.

You will learn the advantages of the various types and styles of tractors and have an opportunity of studying and operating every one of the ten or more makes of tractors which will be used in the course.

Every minute of your time will be spent in absorbing tractor knowledge. Lecture-demonstrations are scheduled every morning from 8:00 to 9:15 and every afternoon from 1:00 to 2:15; practice work or demonstrations during the remainder of the time. Several evenings will be devoted to showing motion pictures of various tractors at work.

The only charge for the course is a registration fee of \$1.00. If you are interested, write to the Citrus Experiment Station, Riverside, California. The course is limited to 180 students."

Champion

Dependable Priming Plugs

Fires Cold Engine

Champion Dependable Priming Plugs are better than priming cups. The gas trickles down the core of the plug and directly over the points where and when the spark jumps. The explosion is instantaneous and sure.

For the hundreds of thousands of automobiles which have no priming cups Champion Dependable Priming Plugs are imperative.

For sale by all auto parts dealers.

Convention of Insurance Companies

The National Association of Mutual Insurance Companies held its 24th Annual Convention at Des Moines November 17-21. Over 630 delegates from 26 different states attended. A majority of them were representatives of state, county, or farm mutuals. The farm mutuals were reported to furnish sound protection at a cost generally running about 40% of the stock company rates. Better mutual service, inspection and improvement of risk methods to enable further decrease in cost were noted.

The 100% Americanism of mutual insurance was emphasized by the speakers. They called attention to the fact that the mutual companies are American institutions of and for their policyholders and are a potent factor in keeping insurance money in this country. That 25 foreign companies, doing only a reinsurance business, received more than \$50,000,000 in American premiums during 1918 was cited in this connection.

The Association was incorporated during the session under the laws of Indiana and the honor of being incorporators was accorded to Messrs. Rutledge and Heming of Iowa, two of the original members, and C. M. McMillan of Illinois, the retiring President. At the conclusion of the session W. A. Rutledge of Des Moines was elected President, and Harry P. Cooper of Crawfordsville, Indiana, Secretary.

Along with the National Association there was the annual meeting of the Federation of Mutual Fire Insurance Companies. This organization of 50 general writing mutual companies with an annual premium income of over \$13,000,000 took important action with regard to rating and fire prevention problems. These companies save their policyholders by reduced rates or refunds 25 to 55% of the usual cost of insurance in stock companies.

In a resolution, they took the position that rating bureaus are engaged in a public service and their services should be available to mutual companies as well as to stock companies. In certain parts of the country rating bureaus refuse to furnish their rates to mutual companies because of their dividend or premium refunds to mutual policyholders.

Both associations gave attention to the resolution of the September Convention of National Association of Insurance Agents at Louisville, in which the stock company agents denounced mutual insurance as a menace to their business in the following words:

Exterminate Mutual Insurance.

"The mutual and inter-insurer is a menace to our business. The time is at hand for a united and aggressive campaign on the part of the stock companies and agents against the socialistic mutualization of insurance.

"It is therefore resolved that this Association respectfully protest against the practice by any stock company of granting reinsurance to mutuals or inter-insurers and we are bound to regard the continuance of such practice as evidence that such stock companies fail in fidelity to their own corporate class.

"Further be it resolved that the National Association of Insurance Agents urges the stock companies to institute a campaign of publicity to the end that this common enemy may be combatted definitely, systematically, and in a spirit of patriotic determination, and that we pledge them our hearty co-operation."

Mutual Companies' Resolution.

Unnecessary loss of life and property by fire, accident, and other casualty, is a menace to the public welfare and constitutes an enormous loss that can by united action be prevented and mitigated in greater part, therefore be it

Resolved, that this National Association of Mutual Insurance Companies institute a campaign of education and prevention to the end that all preventable loss may be combatted definitely, systematically, and in a spirit of patriotic determination, and be it

Further resolved, that we invite all other interests both public and private to co-operate with us to the end that the continued loss of life and property may be reduced to a minimum and that all carelessness, waste, and extravagance may be eliminated as factors in the cost of insurance protection, and to accomplish this purpose we pledge our hearty co-operation.

SEED POTATO SITUATION.

At the meeting of the California Certified Seed Potato Growers' Association in the office of State Director of Agriculture G. H. Hecke last week, plans were laid for a campaign intended to show the advantages of growing certified seed potatoes under the law passed by the Legislature last spring. Some of the most potent arguments in favor of seed potato certification are indicated in figures given by W. V. Shear, as reported by R. E. Jones. Mr. Shear performed the inspection under the former cer-

tification law, and has been appointed for similar duties under the new law.

"California plants about 85,000 acres of potatoes each year. This acreage requires about 750,000 bags of potatoes for seed. Two-thirds of the seed used in California is grown in the state. One-third of the seed is imported, mainly from Oregon and Washington. In addition to its home production, California imports annually, on the average, 400 cars of potatoes from Idaho, 400 cars from Washington and 750 cars from Oregon. None of the Idaho potatoes are for seed, however. Some few seed potatoes have been imported from Wisconsin, but the major portion of the seed potatoes, approximating 250,000 bags, come from Oregon and Washington.

Pure Strain Needed.

"But most of the home-grown seed, which the growers have been forced to use, is undesirable because of disease and lack of uniformity and productivity. What is needed in seed is freedom from disease, uniformity and prepotency of the strain. In other words, the strain must be pure and

must be able to perpetuate itself. Seed potatoes are much like seed livestock; if they do not represent purity of desirable strain, they soon "run out." Quality and quantity of production is lost."

There is plenty of room and market for certified seed potato growers in California.

One of the finest frigation systems in the world is on the Bastanchury ranch at Fullerton. Although this ranch has been owned by the Bastanchury family for the last thirty years it was just a short time ago that Mr. Bastanchury decided to develop an improved ranch. He started these improvements with a \$250,000 irrigation system and about \$200,000 worth of the best and finest equipment he could buy. There are over 3,000 acres of land in this ranch, about 2,000 acres in oranges and lemons and about 500 in walnuts.

It is reported that the Conaway Ranch has bought the Coil Ranch just north of Woodland. This ranch has a large acreage of alfalfa, well equipped with silos and other buildings,

Built to meet the work—not to meet a price

Sowing Success

FARMERS who use the Twin City "12-20" are Sowing Success. This tractor is designed and built to work on schedule as dependably as a fine watch keeps time. For Twin City engineers have built into it every element of reliability.

The 16-valve motor, valve-in-head type, burns *all* the kerosene that goes into it, so complete is the clearing due to the double valve capacity. And the power delivered gives a surplus far beyond the rating.

Just as the 16-valve design guarantees its economy of operation, the construction assures steady service for a generation. The cylinder sleeves are removable—reboring never necessary. The "whip" of vibration is reduced to harmlessness by the finely counter-balanced crankshaft, drilled for force-feed lubrication.

The transmission, mounted on Hyatt roller bearings, runs in a bath of oil. It uses only 3 reductions to deliver the power at the drawbar. The gears are machined to absolute accuracy, and heat-treated.

On motor and transmission mainly depend the life and service of the tractor. But every part of the Twin City "12-20" is designed and built up to the same rigid standards of excellence.

HORTICULTURAL JOTTINGS.

The Reedley District figures on shipping more than 60 cars of navel oranges to market this year.

With approximately 1,045 acres in oranges in Kern county the estimated yield of the fruit is 114 carloads, which will be shipped to different destinations.

Plans for organizing the cherry growers of Santa Clara valley, who are said to produce approximately one-third of the annual output of the State, in connection with the California Co-operative Canneries, are being considered.

The Placer County orange crop is light and in some groves there are a good many splits. The fruit is well colored, better than shown in the plate of the 70 per cent colored orange issued by the Office of Standardization.

The grapefruit shipments from Florida for the season up to November were 1,600 cars—about the same as last year. The orange movement this year to the same date was only 627 cars compared with 1,124 cars to the corresponding date last season.

At the second annual meeting of the Central Valley Honey Producers Co-operative Exchange, held at Modesto recently, General Manager F. W. Burch reported a successful year with 4,000 cases of honey valued at about \$85,000 handled through that city. This was nearly half a million pounds.

Practically all the olive crop of Yolo county remaining on the trees was destroyed for pickling purposes by the recent high wind and is fit only for oil, according to the statements of County Horticultural Commissioner William Gould. Between 25 and 30 per cent of the crop had been picked and picking was in full progress when the storm came.

Frederick Maskew, in charge of the Plant Quarantine Division at Sacramento, says: "State Quarantine Guardians in the citrus producing counties should anticipate the requirements on export shipments of citrus fruits, and provide themselves with the necessary certificates required in such instances. A supply of these certificates in blank form can be obtained from the office of Standardization, Department of Agriculture, Sacramento.

According to the estimate of Horticultural Commissioner Jno. P. Coy, the orange yield of 1919 and 1920 in San Bernardino county will be approximately equal to that of the season just closing, which was one of the biggest crops on record. Last season this county produced 10,907 cars of oranges, or about one-third of southern California's total crop shipped to date, which was 35,320 cars. Mr. Coy's estimate is that the crop for the coming season will approximate 10,718 cars.

The raising of early table grapes is enlisting the interest of growers in the Imperial Valley. It has been known for years that Malagas and Thompson Seedless ripen in the Imperial Valley from two weeks to a month earlier than in other localities in the State, with perhaps the exception of the Coachella Valley, where the acreage is small. Years ago grapes were yielding as well as at the present time, but the growers were unable to market them.

HAY SHRINKAGE IN STACKS.

To the Editor: We sold 36 tons of alfalfa hay (scale weight) 30 days after it had been in the stack. The party who bought it claimed that we should discount the weight on account of its being in the sweat only thirty days. In your opinion, how much would it shrink in weight at the end of sixty days. How many tons of alfalfa hay will a stack contain that measures 29 feet wide, 37½ feet long, 61½ feet overthrow, 17½ feet in height?—P. J., Mendota.

Our estimate has been corroborated by hay men—in your district during summer, with hay that was fairly well cured before stacking, the shrinkage in weight should be less than ten per cent in the first sixty days—still less if cured as thoroughly as your climate

is likely to cure hay. With about a dozen variable factors in estimating the weight of hay in stacks, we estimate that your stack contained 41.4 tons. If you weighed 36 tons into that stack, our estimate shows the unreliability of figuring weights on measurements or your hay must have been extra dry.

BIG WHEAT YIELD.

Twenty-nine sacks of wheat per acre, each sack weighing 133 pounds, was the crop T. J. Crispin took from 65 acres in Stanislaus County in 1918. The land was rich, having been in alfalfa previously with a crop of beans following the alfalfa. The seed was of the "Salt Lake Club" variety furnished by the Government. It is the only kind that would have made grain on this land in the opinion of Mr. Crispin. It makes short straws, stooling very nicely. The heads are longer than "the old Club we used to sow." The kernels are small, so that 70 pounds per acre drilled in gave a good stand. The ground was well plowed in December. It was worked down and the wheat was drilled in January. Mr. Crispin has none of this wheat for sale.

Your Chance Now to MAKE BIG MONEY

Stephens' New Trappers' Book tells you how. Coyotes, Muskrats, Skunks, Wild Cats and all other Western Furs are selling in Denver this year at the highest prices ever paid.

DENVER COLORADO is the Closest for Western Trappers and Fur Shippers. Stephens of Denver is the largest exclusive buyer of Western Raw Furs in the world.

STEPHENS charges you no commission—saves you \$10 on express or parcel post and you get your money 2 to 10 days quicker—because Stephens is closer to your town than any other important Fur Center.

What has the Design to do with "Pull"?

At first thought, it may seem a simple matter to design a track like that of the "Caterpillar" Tractor, in such a way as to eliminate all the power-waste possible and reduce upkeep to the minimum. Actually, it has taken a quarter century to perfect the "Caterpillar" Track.

And so, throughout the "Caterpillar" Tractor, correct design is largely responsible for its almost unbelievable power and durability.

The secret of "Caterpillar" Tractor "pull" is, that correct design enables the power of the motor to reach the drawbar with minimum loss and friction. That's why the "Caterpillar" Tractor has always out-pulled other tractors of equal rated horse-power, and why "Caterpillar" maintenance expense is lowest.

Superior construction is not always evident to the eye. Results reveal more than appearance, and no other machine can duplicate Holt results.

Folder No. 413 explains other "Caterpillar" Tractor points of superiority. If you are interested in tractors you should send for it.

Mechanical Power on the Farm

BIG TRACTOR FOR BIG ORCHARD.

For orchard cultivation on a big scale, a big tractor is more economical, does better work, and experiences proportionately less upkeep cost and depreciation than small ones, in the opinion of the Manager of the Patterson Land Co. of western Stanislaus county. This company has about 200 acres of prune, apricot, and peach trees six or seven years old. They have three medium-sized tractors. The manager points out that for smaller orchards they would be most economical. But on the Land Company's orchards the smaller tractors were tried and found too expensive and unable to get the work done properly within the time limit set by Nature for the work to be done. This refers particularly to cultivation which, on this rather heavy soil, must be done within a short period. The smaller tractors had to be crowded and the engines developed trouble quickly on that account. It was also found, according to the Manager, that the big tractor required less space to turn than the others. Owing to its great power, it easily pulled cultural implements which worked the ground within six inches of the trees while the tractor ran well clear of the branches. The smaller tractors had to run too close to the trees or else do a poorer job and run over the ground more frequently. With the big tractor a heavy double disk a little wider than half the distance between the rows cultivated practically to the bottom of the plowing because it was angled to the limit and weighted in addition to its own heavy weight. Following the disk and hitched to it was a three-section clod masher, which smoothed the surface into a fine tilth. Thus at one operation moisture was thoroughly blanketed in the soil where roots grew undamaged by the summer sun; and while it was well conserved by quick action before it could evaporate much, the ground was also put into shape to take water most freely at the next irrigation. No "irrigation plowman" here during the summer as there is when cultivation is done less deeply with less power available. The fruit on this young orchard developed great size; and especially with cling peaches, the soft fine surface given by the double cultivation to the soil enabled a great deal of the fruit which dropped to be sent to market with unbroken skins and unbruised flesh. This counts up in profits when fruit is large.

While the big tractor has been used only for cultivation this season, many tractor users would expect a considerable repair bill after cultivating 200 acres to the bottom of the plowing three times. Repairs on this tractor have been only nominal because a good man was in charge of the tractor. The Patterson Land Co. manager believes that the greatest per cent of tractor troubles are due to negligence.

A TRACTOR FOR ALL WORK.

(Written for Pacific Rural Press.)

Fruit trees should have water when they need it. C. C. Turner's orchard in eastern Stanislaus county got the water, even though the 15 h. p. engine which normally runs the irrigation pump was out of commission. Fortunately Mr. Turner has a medium sized tractor. 'Twas no trouble to run it down to keep the pump going while the engine was being fixed.

Always until the past season Mr. Turner has used his spray pump engine to saw up the winter's wood. This season it was found much handier to hitch the tractor onto this job and a great many cords were sawed. Clarence Van Norman, who handled the tractor a great deal, tells of cutting 40 tiers of stove wood (a tier is a stove-length 4 feet high and eight feet long) in one job. Two men were kept busy putting the wood to him while he put it to the saw.

A neighbor had four tons of beans to thresh. The tractor operated the thresher all right, but curiously it

was not hard enough work to keep the engine warm enough to burn the coal oil for which it was designed. Distillate had to be used on that job.

A small house was wanted at a point about eighty feet away from where it was built. It was pulled there by the tractor in low gear and without any stopping for lack of power. It happened that a prospective tractor buyer came to the place just as the house moving started. He bought a tractor.

Ordinary double-disk cultivators are not suitable for the deep cultivation Mr. Turner and Mr. Van Norman give their 65-acre orchard. They figure that it works more like a packer and is not good for the trees. So they had a seven-foot single disk made of 24-inch disks—a whale of a machine which required five horses to pull it. This disk follows the tractor easily cutting to the bottom of the plowing.

The tractor was bought before plowing commenced in the bottom land last spring. It is rated at 12-20 horsepower, and it plowed 25 acres a day. In one place Bermuda sod had not been plowed for seven years. The tractor turned this seven inches deep with two fourteen-inch bottoms. Mr. Turner figures the engine can do the work of a dozen horses.

When he was planning to buy it, his wife being a great lover of horses, objected, but the answer was, "I can't afford to keep and use horses when I can plow 25 acres a day alone." Repairs have cost \$16, including labor, and the machine is in shape for the coming season's work.

DYNAMITE DOUBLED PRUNE CROP.

How a prune crop jumped from 3900 pounds to over 8000 pounds in the dry year of 1913 is told by Geo. N. Tyler of Santa Clara county, who did the dynamiting which resulted in not over 5 per cent dropping, as compared with 30 or 40 per cent in neighboring orchards. Dynamiting broke up the hardpan, accepted and saved what rain fell during the winter of 1912-13, pruned the roots and started new ones which actively fed the doubled crop in 1913. The orchard was dynamited in the fall. Trees were 16 feet apart and shots were placed in the center between each four of them. The mistake was made at first, of boring through the hardpan and exploding the shot under it. A pot-hole was thus made, but the hardpan, 12 to 24 inches thick and 18 to 36 inches under the surface, was not much affected. The successful system breaks up the hardpan, throws up the ground for ten feet around the shot, and cracks it 16 feet away, as shown where some of it had been uncovered that far from a shot. The successful way was to bore a test hole to see how far it was through hardpan, then bore another hole nearby but only two-thirds through it. A 1½-inch cartridge of 25 per cent dynamite was used in each hole.

PNEUMATIC TIRES FOR TRUCKS.

"The life of a motor truck is perhaps the greatest factor in determining the cost per ton-mile for hauling," says the representative of a well-known tire company. "Pneumatic tires certainly lengthen the life of a truck, besides reducing upkeep costs. Pneumatic tires will be adopted almost universally on trucks up to at least the three-ton size, as we figure it after three years' of investigation." Various trucks are already putting on pneumatics as standard equipment. Not only do they give greater mileage to the trucks and greater safety to the load, but they also permit heavier loads to be hauled on our highways. The state law fixes the weight to be hauled proportional to tire surface bearing on the roadway.

"Gowag" is the name suggested by G. W. Morrison to help the motorist make certain that he will have no troubles away from home. G—gas, O—oil, W—ater, A—air, G—grease.

Cletrac

TANK-TYPE TRACTOR

(Formerly known as the Cleveland Tractor)

It runs on tracks as a wheelbarrow runs on a plank

TRY to push a loaded wheelbarrow through soft plowed ground. You have to exert every ounce of your strength. The wheel sinks in deeper and deeper and you finally get "stuck" altogether and have to take off your load.

But lay a plank over the same soft ground and you can roll the same wheelbarrow over it with the same load—but with only a fraction of the effort.

It was the plank that made the difference. Its broad flat surface distributed the weight of the load so that there was very little pressure at any one point.

And right there you have the principle back of the Cletrac Tank-Type Tractor. It runs on broad flat

tracks in much the same way as the wheelbarrow runs on the plank. No power is wasted. You can pull a bigger load. Fuel and oil go further. And more work can be done in less time—at less cost.

Because you can work so efficiently on soft soil with the Cletrac you can go through with the entire preparation of the seed bed—a most unusual thing for a tractor to do. The Cletrac doesn't sink in and doesn't leave two hard trails of packed down soil behind it.

Order your Cletrac now. There is plenty of work for the Cletrac to do, like getting out wood, hauling logs, grinding feed, breaking roads, hauling manure, etc., during the winter months and when Spring work comes along you will be fully acquainted with your Cletrac.

Pushing a wheelbarrow through soft soil is almost an impossible job. The wheel sinks in and gets stuck.

Lay a track of boards over the ground and you can roll along easily enough. It is this principle that has made the Cletrac Tank-Type Tractor so marvelously successful. It doesn't push through the soil; it rides on top on its own tracks.

Tractor Book Free

We have an interesting 32-page book entitled "Selecting Your Tractor" that will be sent free upon request. It discusses tractor farming problems on a "brass tack" basis. Write for your copy today.

COULDN'T GET ALONG WITHOUT THE RURAL PRESS.

San Rafael, Cal., December 4, 1919.

Dear Rural Press:

I am positively ashamed to find that I am in default in the matter of the renewal of my subscription for your most valuable and interesting publication, which has been a vade mecum with me for more than a quarter of a century and which my bulky files indicate. Why, bless you, I could not keep house without you! Frequently the information contained in a single issue is worth many times more than the annual subscription price. I don't see how any Californian who is engaged in farming of any sort can get along without the Rural Press.

Yours very truly,

MAJOR CHAS. CHRISTENSEN.

WOOL IN THE MIDDLE WEST.

(Written for Pacific Rural Press.)

The last issue of the Breeders' Gazette says that the wool pooled in Wisconsin, Iowa, and Illinois, has been cleaned up at an approximate average of 58 cents. The results have been very gratifying this season with this method of marketing the crop, and is encouraging for the outlook in the future. Fine and fine medium staple sold for 78c; half blood clothing, 63c; medium clothing, 61c; half blood western, 62c; three-quarter blood western, 61c; and quarter blood western, 61c; these western wools being farm shorn. The market for fine and fine medium is strong, with coarse grades hard to move at any price. Foreign markets report strength in fine wools with prospects of further advances. This is for wool of good length with short clothing hard to move at any price.

The United States Tariff Commission is engaged in a systematic study of the sheep and wool industry, relative to future tariff legislation. They recently held meetings open to the public at Columbus, Ohio, and Chicago, Illinois, with the object in view of giving all those interested in any way a chance to present their views to the Board.

SANTA ANITA RANCHO LOSES W. H. TAYLOR.

(Written for Pacific Rural Press.)

When a livestock breeding establishment like the Santa Anita Rancho loses a manager like W. H. Taylor, the vacancy is not easily filled. Mr. Taylor has been with the rancho for several years, and during that time has had the honor of breeding, developing and exhibiting some of the finest stock ever seen in the great country west of the Rocky Mountains.

There has just been completed on the ranch a Club House for the benefit of the employees, that is complete in every particular, being equipped with every modern device for the comfort and entertainment of the help. This is the culmination of an idea of Mrs. Baldwin, and worked out and finished under the supervision of Mr. Taylor during his stay.

Mr. Taylor is going into the oil business, and if he makes as great a success of that as he has of the livestock business on the Santa Anita Rancho, he will soon be listed among California millionaires.

THE FIRST LIVESTOCK SHOW OF 1920.

Either the first of the year or the last of the season are two ways of designating the National Western Stock Show to be held in Denver, Colorado, January 17th to 24th, 1920. Some building and ground space have been added, but for all this, the number of cattle of the Shorthorn and Hereford breeds are to be limited. What might be called a "plucking" committee will inspect the entries and any found unworthy will be withdrawn. A unique feature will be that no free tickets will be issued, even the exhibitors will be required to pay admission. This experiment will be watched with interest by the rest of the stock show interests. The State of Colorado and city of Denver contribute \$5000 each toward the support of the show.

FARM BUREAU PUREBRED HOG SALE.

The first San Diego County Farm Bureau Purebred Swine auction sale, held at San Diego, December 4th, was a success from both the breeders' and buyers' viewpoint.

The consignors were Bellar & Borden, Carlsbad, Duroc-Jerseys; Cloverdale Ranch, Escondido, Poland-Chinas; Winsor Ranch, Bonita, Duroc-Jerseys.

This was really a promotion sale, and not a high average was expected, but the bulk of the hogs sold from \$70 to \$100. The top of the sale was a Duroc-Jersey bred gilt, consigned by Winsor Ranch, which brought \$265, going to Mr. Rudder of the Rudder Grill in San Diego.

The offerings went almost entirely to small farmers in San Diego county, which was the primary object of the sale. Almost every buyer expressed the determination to bring pigs to the San Diego Fair next Fall.

AGRICULTURAL NOTES.

Three squirrel inspectors, whose expenses are to be paid by the Santa Cruz county supervisors, will be stationed at Santa Cruz, Watsonville, and Davenport.

Insect pests injurious to cereal and forage crops are receiving exclusive attention from T. D. Urbahns of the U. S. Department of Agriculture, whose office is in Berkeley, but will be moved to Sacramento early next year.

A 30-foot channel for ocean vessels to Sacramento is to be the chief aim of the Sacramento Chamber of Commerce for 1920. They have been getting what they go after under the secretaryship of H. S. Maddox. Such a tidewater connection would mean cheaper transportation for California rice, grain and fruit.

Eastern politicians thought they did not need tariff protection for beet sugar from Cuba. But it transpires that the Sugar Equalization Board has recently moved 30,000 tons of beet

sugar from mid-western States to the East to partially relieve their shortage. Now let the Eastern politicians

take a hump and put through some measure to build up the beet sugar industry.

Is Alfalfa Meal a Concentrate?

(Written for Pacific Rural Press.)

This seems like a queer question to ask about a substance that has come to be one of the near-standard feeds of livestock throughout the alfalfa growing regions of western United States. Statements of approval, and otherwise are made regarding it, and now comes the query, "Is alfalfa meal a fattening ration for hogs?" There seems to be doubt in the minds of some feeders as to just what it is fit for, and just how it should be fed. Therefore, it seems best to discuss the question in a short article.

Alfalfa meal is alfalfa, ground more or less finely, and generally packed in large sacks holding 100 lbs. each. If (notice the "if") nice, bright, clean alfalfa hay is ground, and is ground properly, the meal has practically the same composition as wheat bran, although it is not as rich quite as the bran. It has more fibre, and its digestibility is not quite as high. In this form it is not liked by stock as well as wheat bran.

If the alfalfa has been damaged in any way, or has more or less foreign matter, like weeds, foxtail, etc., incorporated in it, then its feeding value is lessened, as well as its palatability. Animals, either fed for milk or meat, must like their feed, or they will not eat enough for maximum production. We often hear it said, and it is true, that a change, or variety, of feed produces better results than one or two feeds alone. This is because the one feed becomes tiresome, and there is a lack of appetite.

Alfalfa meal is not a concentrate, or adapted for fattening purposes. Hogs fed on alfalfa meal alone would almost starve to death. The hog's digestive apparatus is not adapted for handling large amounts of roughage; in fact, this is the reason why a hog will make such rapid gains. He lives largely on concentrated feeds like corn, milo maize, Egyptian corn, barley, wheat, middlings, etc. These may be profitably supplemented by alfalfa pasture, alfalfa hay, or alfalfa meal. Alfalfa pasture is the best way to use this great forage plant for swine, making them do their own harvesting, grinding, and feeding.

However, it is not always possible to have alfalfa pasture, and then the next best thing for the hog family probably is alfalfa hay or meal. Feeding work carried on with swine at various state experiment stations, proves quite conclusively that long alfalfa hay fed in racks, so that the hogs could not waste it, gave as good results as alfalfa meal, or at least the expense of grinding was saved. Again, where the long hay is fed, effort is made to get good hay for piggy, and he responds by eating freely of it and thereby saves considerable more expensive feed.

There is an old saying that "charity covereth a multitude of sins," and so-called alfalfa meal seemingly covereth a multitude of weeds and foreign matter in many cases. Piggy knows, though, and while he may eat it mixed with other things, the results will be lacking.

Alfalfa meal is not a concentrate or

TULARE HOLSTEIN FARM BREAKS RECORD.

Ruby Pietertje of Forest Hill 2nd, owned by Tulare Holstein Farm at Tulare, has broken butter production records of the Pacific Coast for 7 days. The amount of butter produced was 39.74 lbs. from 667.9 lbs. milk. The 15-day record is 81.7 lbs. butter, and 1451.6 lbs. milk. This record is the third highest in the world for 7 days. A six-year-old cow, Faye Tritomia Hengerveld, in the same herd, produced 30.55 lbs. butter from 560 lbs. milk in 7 days.

The first daughter by Prince Riverside Walker, first time freshening, has made over 17 lbs. butter in 7 days, 33 days after calving. She is milking over 50 lbs. daily, and is being continued on semi-official test.

W. H. Redd, the well-known herdsman at this noted farm, has so much testing work on hand that he has W. L. Kingsley as his assistant.

fattening ration, as it is simply good or poor hay ground more or less finely. Hogs do not like it when fed alone as a single article of diet, and would not do well on it. It has its place to feed with some of the grains, and will give good results when so combined, in promoting digestion, and helping to produce bone and lean meat.

HOLSTEIN SALE SUPREME.

The A. W. Morris & Sons Corp. sale of December 18th at the State Fair Grounds, Sacramento, will be an opportunity for Holstein fanciers to buy animals of supreme merit. They are selling 60 head of cows in milk, most of them under 6 years of age—among the younger ones are a number of undeveloped cows, all out of high-record dams, which have not as yet been given a chance to show what they can do. These naturally will not sell as high as the cows of record, and will present an opportunity seldom encountered for buying animals of great merit.

All the cows are bred to bulls of

unusually long distance record breeding, including the grand champion son of Tilly Alcartra, son of Miss Valley Mead De Kol Walker, the 1100-lb. junior 3-year-old that won the California State Dairy Cow competition, and a full brother of Aaggie Acme of Riverside 2d, a world-record cow.

All the serviceable aged bulls they have on hand will be sold, including a 2-year-old they had selected for their own use, whose 3 nearest sires are the best known bulls in the Holstein breed.

TAGUS RANCH SALE REMINDER.

One of the largest farm auction sales to be held in the San Joaquin valley this year will occur December 16-17th. The offerings are so varied and extensive that anyone wishing to do so could about stock a farm from tools to mules on the agricultural day, and Shorthorns, Milking Shorthorns, and Herefords on the cattle day. The Shorthorns of the beef strains are strong in Scotch blood, and present a stock that will not last long when the sale has once started. Those who want cattle that will produce milk, and are of a size and conformation that will grow good steers, should

be there when the Milking Shorthorns pass through the ring.

Anyone needing range bulls should find what they need in the Hereford offering. They are not registered, but are from registered stock.

The draft horse offering includes a fine lot of stallions and mares of three of the leading breeds—Percherons, Belgians, and Shires—just the kind that will breed the kind that bring the money in the markets of the world just now.

SPOTS DRIED-UP IN ALFALFA.

"When I started putting in alfalfa, I used to notice spots within a check where the alfalfa dried up after the second cutting," says M. J. Kline of eastern Stanislaus county. "I thought it was where we had scraped off the good dirt, but I've found those spots were where we filled-in. An irrigation would settle the dirt, water would stand there, the soil would bake on the surface and cement together underneath, moisture would evaporate too freely, and the alfalfa roots could not supply their tops. After the plants become old enough to pierce the sub-soil while it was still soft from the winter rains, they did not suffer so much on these spots during the summer."

HYATT

ROLLER BEARINGS

For Tractors

As Tractor Design Advances

The best knowledge of how to build a better tractor comes from actually building tractors and having their dependability proved year after year in actual farm work.

Whenever a manufacturer, after years of experience in tractor building, puts the unequalled value of that experience

into a new and better tractor, the decision to use Hyatt Bearings is practically unanimous.

Time has proved that for the better construction of tractors, plows, separators, grain binders, wind-mills, feed grinders, and all agricultural machinery, Hyatt Bearings should be used.

The Judging of Livestock

(Written for Pacific Rural Press by Thos. F. McConnell.)

Does any one ever really become an expert judge of livestock? If not, then the colleges of agriculture all over the United States had better revise their curriculum to some extent, and eliminate the large amount of time devoted to teaching this prominent part of animal husbandry. The writer would very much dislike to see this done, as he does not want to think the long hours wasted that he spent in the cold barns of the Wisconsin College of Agriculture, twenty-five years ago before they had their present elaborate and well-heated stock pavilion. There the late John A. Craig, Professor of Animal Husbandry, than whom there never was a greater, instilled in the minds of his students a love for farm animals and an ability to recognize at least the principal good and poor points of the different breeds. This was done then, and has been the constant practice in all other schools of agriculture teaching animal husbandry in the country.

Now has this time all been wasted? No, of course not, but when we see what has happened twice recently in the Extension Department of the California College of Agriculture at two widely separated points, we wonder what is wrong. Ever since, and somewhat before the time mentioned in the beginning of this article, people have been hearing about the "3 wedge shapes" of a correctly formed dairy cow, the distance apart of the vertebrae and ribs, the width of the hips, length of the rump, the size and shape of the udder and milk veins, with many other points to be taken into consideration in estimating the worth of the dairy animal. Another thing that we had to look out for, and that was the nervous or dairy temperament. This was an elusive proposition like a California flea in that we would think we had it, but many of us were never exactly sure about it after all. We have been sure though that we were pretty good judges of dairy cattle and other kinds of livestock, particularly sheep, as well.

Placing According to Production.

To illustrate what we are driving at. At the Los Angeles Livestock Show held this fall, after the judging of some of the dairy classes, the on-lookers, who were no doubt good judges of dairy cattle, were asked to remain a short time. Assistant Farm Adviser F. H. Scribner of Los Angeles County had led into the ring 5 cows that had been under official test for one year. The spectators present were asked to place the three best cows according to their economic production ability as evidenced by their appearance. After some discussion this was done. The five cows all had about an equal number of supporters with the grade Guernsey a slight favorite, and the grade Jersey having the least number of supporters. According to their net returns the grade Jersey was placed first with a profit of \$392.50, and the grade Guernsey fifth with a net profit of only \$23.50, with the others scattered along between. Of course, it will be said that all the crowd were not educated judges of livestock, but it is safe to say that a large proportion of them had received some instruction.

Kings County in Same Class.

Kings County dairymen took an automobile excursion through the county, stopping at many prominent dairy ranches, investigating methods and inspecting the stock. The last place visited was the Post Card Ranch of which Roy M. Filcher is manager. Here the dairymen were asked to place a class of 5 cows according to their merit as producers as indicated by appearances. Twenty dairymen participated, and after they had all made known their decisions, Mr. Filcher announced their production records. The best cow, according to her records, had but three supporters among the 20 dairymen working on the class. Here the best cow, according to the scales and Babcock test, was considered the poorest by the majority.

Would 20 so-called experts have done any better if they had been asked to pass upon the class? It is easy to say "yes" or "no," but there is no way of actually finding out except we take the evidence before us. No doubt many of the people asked to pass upon these two classes had imbibed some of the ideas of modern stock-judging, and were guided by them more or less in arriving at their decisions. Are we placing too much stress upon mere conformation? If we are, some must have mistaken ideas about conformation as in the Los Angeles classes the people placing the animals were about equally divided, and at the Post Card Ranch only 3 out of 20 placed the first cow.

Either we are placing too much stress on conformation in judging dairy cows, or only a few are real judges. If the first is true, then more attention should be paid to the dairy temperament or ability of the cow to turn feed into milk, to "deliver the goods" as the world says. This dairy temperament is an elusive thing for most individuals to determine, and the question is often in the writer's mind if there are enough physical indications of the qualification for it to be definitely determined by a physical examination. In the score cards there are a certain number of points allowed for this elusive qualification, but just how to recognize them is a hard thing for most people. Either we shall have to find out just what constitutes this dairy temperament, or say that it is not a safe thing to buy dairy cows without using the scales and Babcock test. The writer is frank to say that if he was going to buy a herd of dairy cows, that the Babcock test would be his main reliance with the reservation that in making the selections animals would be given the preference that had excellent production records and also good dairy conformation.

Records Count.

Therefore, the dairymen who are breeding cattle for sale should pay more and more attention to keeping records of performance. Records that are official, if possible, as they are of more value to the world at large, but keep records anyway. The cow-testing associations are the cheapest for the grade herds, and all purebred herds that are not doing official testing, should be in a testing association. It is very evident from the two cases cited that physical characteristics, as understood by dairymen generally, will not determine the highest producers, nor the most economical ones.

Judging Fat Stock.

So far it has been dairy cattle that we have had under consideration, and their ability to produce, as evidenced by physical conformation. This class is not the only one that has had its troubles in the past, as whenever fat barrows, wethers, or steers are judged and slaughtered, the placing in the ring seldom corresponds to the placing on the block. Why is this? has been asked many times. The answer lies in the fact that the man judging in the ring is governed by the outside appearances entirely, and on the block by the quality and percentage of salable meat.

Another phase of the meat-producing animal judging should be considered also. It sometimes happens that fat classes and carlots are judged by men trained in the stock-judging schools, and place the awards according to their best judgment, but when the animals are auctioned off, and bought by representatives of the meat-packing industry, the animals or lots placed "down the line" bring the highest prices. An illustration of this occurred in the carlot classes of fat hogs at the recent California International Livestock Show. The carlots of Poland-Chinas that were second in the heavy and light divisions respectively, sold for a higher price than the grand champion carlot of Berkshires. Were the judges who awarded the prizes wrong, or were the men buying for slaughter and consequent profit wrong? It is not for the writer to

say, but it is the business of the agricultural colleges and managers of the livestock shows to study these ques-

tions, and see if theory and practice cannot be brought so close together that they will finally meet.

Large Production and Fine Type

and backing of an unbroken line of great producing dams are hard to beat. Come and see the result of this breeding, or write us for further particulars.

Perkins, Calif.

CHICAGO INTERNATIONAL GREATER THAN EVER.

(Written for Pacific Rural Press.)

While we have no detailed report of the whole show, enough has come by wire to tell us that the above heading is no exaggeration.

Little Sweetheart, exhibited by T. S. Glide of Davis, the grand champion Shorthorn heifer of the Pacific Coast, was made grand champion Shorthorn female of the United States. This is a great thing for California Shorthorn breeders. We have known for a long time that we could raise the stock, but now the world is finding out that we can raise the top-notch cattle as well as the best oranges, prunes, and raisins.

The University of California won even more than in the past two years. The decision of the judge placing California Favorite Lady third in class, and therefore eliminating her chance of competing for the grand championship, was not popular with some at the ringside. However, U. C. Jock 3d was champion Angus steer and reserve grand champion. Their sheep winnings were also excellent, and the hogs were right up near the top in their classes.

Mark Bassett of Hanford, as usual, has as good hogs as almost anyone in the United States, as he had second prize pen of 5 Poland China barrows, all over 6 months, and under one year. It is hard for any one to see how there could be any better hogs than those Mr. Bassett had, but as there was only one pen better in the country that is something indeed to be proud of.

The grand champion Shorthorn female, Little Sweetheart, was bred by the Ormondale Company of Redwood City, and sold by them to T. S. Glide of Davis, who fitted and exhibited her at all the leading shows this year. The Ormondale Company have a full sister, Little Sweetheart 2d, that looks mighty good to Shorthorn men. She is liable to be heard from in the future if she should come along properly this winter.

ANDERSON BERKSHIRE SALE.

The rainy weather that California has been looking and hoping for reduced the attendance at the F. B. Anderson Berkshire sale, but for all this the average of the bred sows and gilts was \$120.71. The top of the sale was Natomas Beauty, out of a grand champion sow and by the sire of the grand champion sow of the world. This sow was bought by E. S. Train of San Francisco for \$240. The top of the boars was bought by George Meister of Sacramento, when he paid \$140 for Ames Rival Natomas. The sire of this boar was grand champion of the Berkshires at the California State Fair of 1918.

Among the prominent Berkshire breeders present were A. B. Humphrey of Escalon, H. C. Muddox of Sacramento, Geo. Murphy of Perkins, and R. C. Gruhlke of Dixon. J. Francis O'Connor of Santa Rosa drove all the way from his home in the rain in order to get one or two good ones.

Among new breeders present and buying some of the good ones were Ray Mead, Manager of the Whitney Estate of Rocklin, and E. Swift Train of San Francisco, with a ranch in Contra Costa County.

More activity in the importation is manifest in swine than in any other class of livestock, with Duroc-Jerseys, Poland-Chinas and Berkshires leading in the estimation of the swine breeders of the country. Where any of these breeds have been used in crossing on the native breeds, the results have been very favorably received and a continuance of the importation of these breeds can be looked for.

CLOSING OUT!

Public Auction Sale

Wednesday, December 17th

At 10 A. M.

Having sold my ranch and entered other business, I will sell to the highest bidders my entire herd of

REGISTERED O. I. C. SWINE

Together with stock, implements and miscellaneous articles.
My ranch is

Two Miles South and 3-4 Miles West of Wasco Union High School

HOGS

Herd of hogs consists of 12 brood sows that have just weaned their fall litters. These sows are all proven breeders and have raised an average of eight pigs.

Nineteen gilts from 6 to 9 months old.

All selected from the spring litters.

The sows and oldest gilts will be bred to my new herd boar, recently purchased from Oregon.

One hundred pigs ranging from six weeks to three months old. Some dandy sow pigs in this lot.

One 8-months-old boar; one 1-year-old boar; one 1½-year old boar.

Certificates of Registration given with all sows, gilts and boars.

Pedigrees furnished with all young pigs where requested.

Any stock purchased by buyers from a distance will be crated and put F. O. B.

TERMS CASH.

FREE LUNCH AT NOON.

 Mar. 13th—Haag & Bernstein, Poland-Chinas, Hanford.
 Apr. 6th—N. K. Horan, Poland-Chinas, Lockeford.

Dairy.

H. G. Ball of Tulare, a new breeder of purebred Holstein-Friesians, is about starting some of his cattle on semi-official test.

Gotshall & Magruder, Holstein-Friesian breeders of Ripon, have recently completed several excellent 7-day records in their herd, and expect several more later.

The A. W. Morris & Sons Corp., owners of Tilly Alcartra, are going to have one of the greatest offerings of Holstein-Friesians ever seen in the

United States at their sale in Sacramento, Dec. 18th. This herd is known all over the world, and the sale ought to be a record breaker.

Twelve high-grade Holstein-Friesians were shipped to the Hawaiian Islands from the herd of H. E. Vogel, of Fresno. These heifers are about the last of the grades from this establishment. In the future nothing but registered cattle will be bred at this well-known farm.

Jane Garden Farms, of Sacramento, are still getting good records from their Holsteins. Oakfield Adele 2d has 28.27 pounds of butter to her credit for 7 days; Mansel Frances Korndyke, a junior 2-year-old with over 18 pounds for the 7 days. Another junior two-year-old has just completed a 7-day record, but the figures were not available.

Beef Cattle.

The California Cattlemen's Association is having its annual meeting today. A further report of the Marketing Committee will be heard, and two amendments to the by-laws will come before the meeting. Methods of gaining new members will be considered.

Carruthers Farms have just sold a carload of Shorthorn bulls to stockmen about Fall River Mills. These bulls were a fine lot, sired by Count Glory and Hallwood Villager, two of the best Shorthorn sires ever brought to California, either from the standpoint of breeding or conformation. Also two heifers, sired by Hallwood Villager, to James Day, Fall River Mills.

A record Shorthorn sale was held at Anoka Farm, Waukesha, Wisconsin, November 29th. Fifty-four head sold for \$142,150, or an average of \$2,632. The attendance was very large, bidders coming from states from the Atlantic to the Pacific, and from the Canadian line to the Gulf of Mexico. There never, perhaps, was as strong a lot of cattle of the breed offered in a sale on the North American continent.

Swine.

Dr. E. J. Weldon, the Duroc-Jersey breeder, is getting 2 well bred sows ready for the State Association sale on Jan. 14th.

Clayton Slocum, junior member of the firm of H. P. Slocum & Son, expects soon to start on his annual Eastern trip, purchasing Duroc-Jerseys.

All the hog men, both Red and Black breeders, in Fresno, Kings, Merced, and Tulare counties, are evincing great interest in coming auction sales scheduled for January and February. They are already preparing their stock for them, and buyers can expect a great lot of animals from which to make their selections.

The red hogs come to perfection in the hands of H. M. Berglund, the Duroc breeder of Dixon. The recent sale of two bred gilts to Wm. Collins of Dixon, and a service boar to J. R. Jeffrey of Vacaville, shows that he stands well with the breeders at home. Breeders at a distance need not hesitate to send Harvey mail orders, as they will be treated right.

Canna Rose Farm, Riverdale, E. S. Myers & Son proprietors, report the sale of one of their finest young Poland-China boars, "Myers Wonder," to O. M. Myers of the same place; also the cracker-jack gilt, "Violet Girl," to (Mrs.) Helen Van Ness, Laton. This firm is coming right to the front with their hogs. They have bought several good ones this year, and now have an excellent herd.

Duroc-Jersey breeders from all over the State are taking keen interest in the coming consignment sale to be held at Davis, Jan. 14th. Consignments from the following noted herds are already in evidence: H. M. Berglund, Diamond Bar Ranch; V. F. Dolcini, F. W. Gardiner, J. Boyd Harrold, W. H. Hollingshead & Sons, Fred M. Johnson, H. P. Slocum & Son, Smith of Hanford, R. C. Sturgeon, J. E. Thorpe, W. M. Way & Son, Dr. E. J. Weldon, Hazel Louise Farm, Winsor

Ranch, H. C. Witherow. Collectively these breeders have consigned 40 head of bred sows. All those who desire Duroc-Jersey swine should attend this sale, as it will be the greatest collection of red hogs ever seen west of the Rocky Mountains in a sales ring.

The Inglewood Union High School has purchased from Geo. A. Stingle, Lark Meadow Ranch, Berkshire breeder of El Monte, an Ames Rival Brood sow and a young Masterpiece boar. The High School Boys' Pig Club selected seven bred gilts and four open gilts from the same herd. The boys originally intended getting grade pigs, but when they saw the

purebred Berkshire herd, the "grade" idea went glimmering. Mr. Stingle is donating a purebred gilt to the boy that makes the best record with his hog. The boys are planning to hold an auction sale of Purebred Berkshires in May when their agricultural term ends.

A three-months-old Model Defender Lady boar and three sows, one by Great Sensation, one by Great Wonder I Am, and one by Orion Fancy King, is a recent sale by the Winsor Ranch of Bonita to Walter H. Dupee, of the Edgemoor Farm at Santee. Mr. Dupee evidently means to have as good Duroc-Jerseys as he has Guernseys.

BUY YOUR BULLS
AT

MORRIS' SALE

STATE FAIR GROUNDS, SACRAMENTO

December 18, 1919

The sale includes all the serviceable aged bulls that we have in the herd and among the lot is the outstanding young sire—

KING CLORINDA SADIE VALE

whose seven nearest dams average 31.94 pounds butter in seven days. A wonderfully fine, growthy bull carrying the blood of the three great sires, KING KORNDYKE SADIE VALE, KING SEGIS PONTIAC and KING OF THE PONTIACS. He is ready for heavy service and will prove a winner for the lucky purchaser.

This sale includes many highly bred cows with good records and bred to great bulls, which we anticipate will sell far below their value. We do not anticipate a high average and believe it will be a bargain day for Holstein buyers.

In many cases the calves dropped by these cows will be worth more than their dams will cost you. We know of a number of instances where heifers dropped from cows purchased in our previous sales at \$200 to \$400 are now being held at \$500 to \$1500. Don't miss this opportunity, as it may not come again for some time.

A. W. MORRIS & SONS Corp.
Woodland, Calif.

Keep Them Fit
For
Winter Work

Are your horses always ready for heavy work, cows giving lots of milk on the coldest days, hogs putting on pork? It all depends upon their condition.

PRATT FOOD CO.

Sold
by 60,000
dealers

The Tulare County Poland-China Breeders' Association will hold another consignment sale of bred sows and gilts Feb. 6th, 1920. Secretary Shinn says that the quality of the stock in this sale will be even better than in their previous one. Mr. Shinn will have some gilts in the sale bred to his great herd sire, "The Californian," that is one of the leading Poland-China boars of the State.

H. C. Shinn, of Tulare, recently sold the Poland-China sow, Babe's Giantess, that was grand champion at Tulare, for \$500. She was sired by the \$10,000 boar, Harrison's Big, and was carrying a litter by "The Californian." Mr. Shinn also sold his junior herd boar, Fortuna Bob, to the prominent Poland-China breeder, W. H. Rough of Arlington.

The offering of Duroc-Jerseys by the Winsor Ranch at the Los Angeles sale of the 29th of January, is the best bunch of sows and gilts ever put in a public sale in the West according to those who have seen them. They will mostly be bred to Winsor's Giant Orion, the largest boar on the Pacific Coast, and a son of the world's champion, Orion Cherry King, Jr., and to Great Sensation 3d, a son of Great Sensation, the best big type sire in the world, and out of Unedda Lady, the highest priced sow ever sold at auction.

The Fresno District Duroc-Jersey Breeders' Association will hold a bred sow and gilt sale on February 4, 1920, at Fresno. There are many breeders of the popular red hog in this district, consisting of Madera and Fresno Counties, so that the sale will be one worth attending by those wishing Durocs. All popular blood lines will be represented in the offerings.

Merced County Duroc-Jersey breeders have organized for breed promotion and sales purposes, according to Jack Borge, the prominent West Side Duroc breeder located at Dos Palos. Mr. Borge reports a very good business, and says he will have a good show herd out next season. The new highway, slated for the West Side, will put the breeders of that locality "on the map" and boom their business immensely.

Nate Hauck, the well-known Poland China breeder of Alton, Humboldt County, reports a very good business last month. Among the sales reported are eight spring gilts to J. F. McSwain of Merced, two spring gilts to De Forest & Horr of Susanville, and an extra fine spring boar to William Westbrook of Smith River, California. Mr. Hauck has just received a very promising spring boar from Henry Fesemeyer, Clarinda, Iowa, sired by F's Big Jones and out of a daughter of Fesey's Timm. This young boar is from one of the most noted herds of big type Poland Chinas in the corn belt, known as the "Mastodon Type."

Miscellaneous.

California breeders have been liberal buyers of livestock at the Chicago International and American Royal. Romeo Jacks of Monterey bought Herefords at Kansas City; C. Harold Hopkins buying Shorthorns, and Butte City Ranch, Shropshire sheep at Chicago, are all those noted to date, but there are rumors of many more.

FOR SALE—25 head of bred sows, some of them have pigs; balance to farrow about February 1st. Also 2 fine boars. J. J. Flannery, Kifer Road, Santa Clara, Cal. Telephone S. C. 185F4.

Livestock Queries and Replies

(Written for Pacific Rural Press.)

Drying Up a Cow.

To the Editor: I have a cow that will freshen in 6 weeks. She is still giving nearly 6 quarts of milk daily, and does not seem to be failing in her flow. When fresh she gives nearly 6 gallons. How would you manage to dry her up, or would it be advisable to milk her until time to freshen? She is a high-grade Jersey, about 4½ years old, a good producer.—G. W. W., Modesto.

(Answered by the Livestock Editor.)

It is not considered good practice to milk a cow on through the period of freshening. It is thought best, by most authorities, for a cow to have from 4 to 6 weeks' rest. It takes a little clever management sometimes, with the most persistent milkers, to handle the animal in a way so that the elaboration of milk will cease naturally, and without injury to the udder of the animal. Remember that the modern dairy cow has been developed into what is termed a "milk machine," producing more or less economically from the feed consumed the lacteal fluid forming such a large proportion of human food. Some of the animals are such good machines that they will continue to produce milk as long as they are fed even a small ration of the best milk-producing feed, such as alfalfa hay, corn silage, wheat bran, etc. Stop feeding the cow everything except a small ration of grain hay, or better yet, wheat or oat straw. Also stop milking twice a day, soon after putting the animal on a restricted diet. After about a week of once-a-day milking, skip and milk only once in 48 hours, and then not at all unless too much distension of the udder is noticed. After the cow is dry, then a return to a better ration would be in order, with some green feed like roots or silage, to prevent constipation at this period. It may be necessary to mix a small handful of Glauber's salts with the feed once a day for two days. A little extra care at this time may save considerable trouble at freshening time.

Disposition of Tuberculous Cattle.

To the Editor: We are subscribers of your paper and like to read it as it contains much valuable information for the farmer and stockman. I would like to have you answer a question for me. I have read considerable in different papers about inspection of cows that have tuberculosis and have heard many different opinions expressed. Some say that milk cows that have the disease may be sold for beef provided they are fat and others say that such cattle are killed on the spot and burned. It is also said by some that cattle that are so killed and burned are paid for and others to the contrary. Please let me know if such cattle are paid for if they are slaughtered, and if meat from cattle so infected is fit for human food?—Subscriber, Vinton.

(Answered by the Livestock Editor.)

In the slaughter houses where there is government inspection of cattle slaughtered for human food all carcasses found infected with tuberculosis are condemned as unfit for that purpose. There is no law in California compelling owners of animals found to have tuberculosis to slaughter them, much less burn them after such killing. In fact, animals are

sold every day we suppose that have the disease. It is possible and has been done, to offer animals for sale at public auction that have reacted to the tuberculin test. Cows are not paid for in California that are slaughtered because they are diseased, and there is no law compelling such slaughter. Meat from diseased animals is considered unfit for food. No charge is made for answering questions from our subscribers through the columns of the paper.

Warbles.

To the Editor: I have a cow which has several sores on her back. These sores are open and running, and are about as large as walnuts. The cow seems healthy. Please let me know what this is, and what to do for it.—W. C. C., Waukena.

(Answered by the Livestock Editor.)

This trouble is caused by the larval stage of the "heel fly" or "warble fly." This fly cannot bite, but deposits its eggs on cattle, fastening them to hairs. Many of them are fastened on the hair just above the hoof, hence the name "heel fly." Cattle evince great terror when this fly is about, and staid, quiet, old cows will curl their tails over their backs and develop a speed that would attract the attention of a hardened motor "cop." The eggs hatch and gain access to the muscular tissues of the body in various ways, and finally show up on the backs under the skin, causing the "warbles" or sores mentioned. The best way to get rid of them is to squeeze them out by pressing with the fingers on each side of the open "sore." If the "warble" is old enough the larva will pop out, and should be crushed. If it cannot be pressed out, the hole should be enlarged with a small, very sharp knife, and then the larva will come out easily. After removing all that are in evidence, washing the sore spots with a coal tar disinfectant, strength 1 to 50, is advisable. Go over the backs of animals infested at intervals of 2 or 3 weeks during the winter months, or until no more appear. Cattle in small herds that are treated with fly repellants during the summer months are not apt to have many "warbles" in the winter.

"Putting Down Butter."

To the Editor: Will you please give me a receipt for putting down butter.—C. D., Arboga, Yuba County.

(Answered by the Livestock Editor.)

If by "putting down butter" is meant putting it in some form of jar or tub so it will deteriorate as little as possible, you should proceed as follows. In churning bring the butter to granules about the size of No. 6 shot. Wash thoroughly or until water runs clear from the churn. Salt 1 to 1½ ounces to the pound, and work so as to express as much of the water content as possible, and secure a perfectly even distribution of the salt. Have the tub or jar in which the butter is to be packed perfectly clean and sterilized with boiling water or live steam. Earthen crocks or jars are excellent in which to pack butter, for a long period, as they can be made absolutely clean and sterile. Select a size which may be filled at one churning. Pack or press the butter in the jar, so that it is one solid mass with no small holes or spaces left. Fill to

within one-half inch of top, cover with a circle of clean cheese cloth or parchment paper, and sprinkle over with clean salt, store in a cool, airy

place. Good butter in roll form may be stored for some length of time by immersing the rolls in strong brine, and placing in a cool, airy place.

Promote Pork Profits

With Better Poland-Chinas breeding

I have a few young boars by Joe's King just ready for service. They will make your spring crop of pigs profitable in spite of high price of feed and labor. They are the big type, with easy feeding and quick-maturing qualities. I have priced them very reasonably for a quick sale. Write at once for prices and particulars or call and see them.

Condemned Meat Sold as Food

(Written for Pacific Rural Press.)

H. C. of L. is responsible for much controversy in almost every walk of life just at present, and all people are complaining about it from the poorest to the richest. Is it probable that

this high cost is due to scarcity of the staple articles, or is it due to a great extent to "profiteering"? It would seem to a great extent to be due to the so-called "profiteering," and greed seems to breed greed. The human race is not content with ordinary profit, and has been adding on and adding on, until it seems as though the burden is greater almost than the people can endure.

A Criminal Practice.

How unjust and villainous the ordinary run of this excess profit taking really is, no one is prepared to say perhaps, but there is a kind that can not be condemned in too strong terms. This is selling condemned meats as pure and wholesome products. It is criminal in that it not only markets a food product for what it is not, but it actually threatens the life and health of young and old alike in a stealthy, secretive manner, when they are not suspecting an attack of any kind.

A recent copy of the Fresno Republican prints the report of the City Veterinarian in which sensational charges are filed against slaughter-house owners doing business in the city of Fresno. In this report this firm is accused of dressing hog carcasses condemned as cholera infected; the making into sausage carcasses that had been condemned, and placed in the digester tanks to be made into fertilizer, these carcasses being removed after hours, when the inspector was absent. The Veterinarian's report goes into detail, and mentions a number of instances of this gross infringement of ordinances, laws, and common decency.

"Eternal Vigilance" Necessary.

The above is not written for the purpose of condemning the particular firm mentioned in the report, nor the City of Fresno in any way, for all who know anything about this fair city, can vouch for the high quality of the food products on sale in the markets and stores there. A noted American once said "eternal vigilance is the price of liberty," and it is true also that eternal vigilance is the price of good food and clean food. The immense profits to be obtained will tempt the unscrupulous in other places, as well as Fresno, and it behooves the inspectors in other places to be on the lookout, and if they have no system of inspection in the slaughter-houses, to see that one is established.

How does this affect the farmer and stockman? Just in this way. If they do not want their reputations individually and collectively to suffer, then refuse to sell stock for food that is known to be diseased to any but reputable packers, who will use such animals only for fertilizer or tankage. Make the name "honest farmer" a true one, and not one of reproach. Do not think, and say, "Oh, well! Jones over the hill sold his sick hogs for a good price, why shouldn't I do the same?" When did two wrongs ever make a right?

NATIONAL FEDERATION OF CO-OPERATIVE LIVESTOCK SHIPPERS.

This organization, with headquarters in Chicago, but covering a large portion of the livestock country from the Rocky Mountains east, is certainly going after the business in a way that will put it on the livestock map of the United States for all time to come.

In order to put men of ability in the field as managers of the branch organizations, they are establishing Short Courses at the various stockyard centers. These so-called Short Courses extend over a period of about 3 days, during which time the manager students follow the buyers for the various packers, and get their ideas as to what constitutes the different grades of meat-producing animals. The buyers, at certain times, make special effort to communicate their knowledge to the manager students when animals exemplifying certain types are encountered. The chief fault with the method is the brevity of the course.

A CALCO feeder is a self-feeder

The Calco Hog Self Feeder allows hogs to feed at will—

Grain need not be carried for every meal. Container delivers it automatically into the feeding trough as used, and it never overflows. Hogs cannot root grain out on the ground.

Feeders are made of "Armco" rust-resisting Galvanized Iron with Cast Iron bases. Sanitary and clean. Strong and durable. Will last a life time.

Write today for folder and prices.

California Corrugated Culvert Co.

LOS ANGELES
417 Leroy Street

BERKELEY
406 Parker Street

01-28

The self-feeder system, which permits hogs to eat grain at will, either in pastures or dry lots, is becoming more and more popular in the corn-belt states, and more seems to be no valid reason why self-feeders should not prove equally successful in all parts of the country.

Poultry and Rabbits for Profit

WHAT IS GOOD EGG PRODUCTION?

More than 72,000 eggs were produced on the poultry farm of the University of Missouri College of Agriculture in the last year. Reckoning the entire flock, the average per hen is about 150 eggs. This doesn't sound so prolific when you recall stories of 200-egg hens and better, yet 150 eggs a year is nearly twice the production in the average farm flock and ninety eggs more than the average for the United States, according to the last census. If it were not for the fact that a certain proportion of the flock is kept for experimental work and that some of the uncommon varieties are kept for student judging work, the flock average would probably run close to 160 eggs.

The production of the Single Comb White Leghorns on the University Farm is excelled at one experiment station only. This is at Oregon, where Prof. James Dryden has developed an exceptionally high-producing strain. During this past year over ten per cent of the University Leghorns have produced two hundred eggs or more. One individual registered 226 eggs. Another has laid 225 to date and has until December 15 to complete her pullet year. One pen of eight White Leghorns has averaged more than 170 eggs apiece.

The high-producing strain of Leghorns on this farm is the result of nine years' constant selection and breeding by Prof. H. L. Kempster, chairman of the poultry department, who believes that his birds have reached a point in high egg production where a number of different family lines can be established and that production next year will be higher than ever before.

SOMETHING FUNNY SOMEWHERE.

(Written for Pacific Rural Press.)

About Thanksgiving week eggs were selling at about 95c in San Francisco retail stores and the wholesale, or dairy exchange quotation price, was approximately 85 cents. At the same time grocers in many interior California towns were allowing ranchers only 70 cents a dozen for eggs. They were good eggs, too, for the weather at the end of November is cool enough to prevent decay from developing in the ordinary journey from hen to ultimate consumer.

In other words, there is at present a full 25 cents a dozen difference in what the farmer (not the poultry farmer, but the general farmer), is getting for his eggs, and what the city resident is paying for them. Twenty-five cents is as much as that same city resident paid for eggs a couple of years ago. It seems to take as much to get eggs from the average farm to the kitchen door of a San Francisco flat, as it used to cost to produce those eggs three or four springs ago and to transport them to the same place, with everybody handling them getting a reasonable margin of profit. Can you beat it?

That is not the end of the funny facts. The interior grocerymen—in Visalia, to be explicit—were retailing the eggs for which they paid 70 cents, for 80 cents, which is 15 cents less than city stores were selling for, yet apparently that 15 cents a dozen difference would not justify the transfer from country store to city home. If not, the cost of doing business must be terribly high. Some wise man, figure it all out.

POWER IN PURE BLOOD.

(Written for Pacific Rural Press by D. J. Whitney)

Several months ago an article appeared in the Rural Press about the strength of pure breeding in poultry, showing how a pullet from a good Barred Rock rooster and a mongrel hen followed the Rock type strongly. This fact of heredity was verified when eggs, from hens of mixed breeding, mated with a fine White Rock rooster, were hatched. The rooster, though white, had, like all of his

breed, a lot of Barred Rock in his ancestry. The heavy hens, mostly colored, were enough to give some color to the chicks, especially since a large portion of the rooster's remote ancestry were colored also, but his type was so strong that practically every colored chicken had the color of the Barred Rocks. The others were white like him, and, presumably, like their mothers.

In other words the original Plymouth Rock blood, so strong in the rooster's ancestry, was strong enough to predominate in crossings with hens having no known Rock blood whenever any color showed at all. For example, in a hatch of 18, four were white and 9 colored like Barred Rocks. This might be worth noting as to the power of good blood lines if the rooster was a purebred Barred Rock. As a purebred White Rock derived only partly from the barred variety, the illustration is more striking.

THE LOS ANGELES POULTRY SHOW

The Twenty-second Annual Show of the Los Angeles Poultry Association opened last Saturday with more than 3,000 entries for prizes aggregating \$3,000. Included in the program was the eighth annual show of the Los Angeles Pigeon Club, the State meeting of the California Ancona Club and the annual convention of the International Single Comb Black Minorca Club.

A series of talks of interest to fanciers was delivered through the week, and the judging was done by competent experts and was instructive and satisfactory.

EARLY HATCHES MAKE BIGGEST RETURNS

In the State Egg-Laying Contest, conducted by Enoch Peterson, Poultryman of the Agricultural College, it is only the early hatched birds of both the general purpose and laying breeds of fowls that are giving any creditable return in eggs so far. This demonstrates the fact that any who are interested in having their chickens pay for their feed during the winter by laying eggs, should hatch them as early as possible in the spring, so they may get their growth and be prepared to start laying in the fall.

A CORRECTION REQUESTED.

Bert P. Ward, President Northern California R. I. Red Club, writes that a mistake was made in our report of the winnings in the Rhode Island Red class at the California International Livestock Show. He cites the winnings as follows: "M. E. Jeter won 1st cock; 3rd hen; 3rd pen. Oak Shadows won 2nd cock; 1st cockerel; 1st hen; 2nd pullet. F. M. Lail won 1st and 3rd pullet; 2nd pen; 3rd cockerel. Ward's Poultry Farm won 1st pen; 2nd cockerel; 2nd hen; Special for Best Display."

Do not overlook the fact that the chicks must have shade. If there is no natural shade for them to stay under during the heated part of the day, be sure and provide sufficient for their needs.

Infertile eggs will withstand marketing conditions much better than fertile eggs.

BIG BUSINESS IN EGG PRODUCTION.

Members of the Poultry Producers of California received \$283,881.70 for their eggs during the four weeks from October 1 to 29, according to auditor's condensed financial statement of the association, dated November 29. The concern handled for its members during the four weeks covered by the report 14,378 cases of henneries, an av-

erage of 3595 cases a week. During the thirty-nine weeks from January 29 to October 29, 265,728 cases of eggs were handled, for which a total of \$3,746,224.85 was received. Total cost of operation (per cent of sales) was 5.91 per cent for the four week period and 5.15 per cent for the thirty-nine weeks. The report of operation of business follows:

Operation of Business.

	Oct. 1 to Oct. 29 4 weeks	Jan. 29 to Oct. 29 39 weeks
Total eggs handled, cases	14,378	265,728
Total operating expenses (including legal expenses and depreciation)	\$9,760.49	\$75,025.65
Total supplies (cases, fillers, etc.)	7,043.31	118,035.20
Total all expenses	\$16,803.80	\$193,060.85
Operating expenses (see above) per case	.678	.282
Cases, fillers, etc., per case	.489	.444
Total all expenses, per case	1.167	.726
Income from selling cost (2c per dozen)	\$8,940.54	\$161,247.38
Income from other sources	328.50	7,627.02
Total income	\$9,269.04	\$168,874.40
Total expenses (as above)	16,803.80	193,060.85
October income fell short of expenses by	\$7,534.76	

Cost of Operation.

	October 4 weeks	Total 39 weeks
Total eggs handled, cases	14,378	265,728
Total receipts for eggs	\$283,881.70	\$3,746,224.85
Operating cost, per cent of sales	3.43%	2.00%
Cost of cases, etc., per cent of sales	2.48%	3.15%
Total cost, per cent of sales	5.91%	5.15%

CONTROLLED PRICE OF EGGS IN GREAT BRITAIN.

According to a cablegram from the Agricultural Trade Commission at London, dated October 1, 1919, the British Food Controller resumed the control of eggs and has set the following maximum prices, per dozen: Fresh eggs, domestic or imported, wholesale \$1.04; retail, \$1.14; preserved, wholesale 83c; retail 93c; small eggs, wholesale 56c; retail 62c.

POULTRY NOTES.

The annual poultry show, to be held under the auspices of the Kings County Poultry Association, is scheduled for three days, December 18, 19 and 20. It is believed that the show this year will be one of the largest ever staged by the association. Robert V. Moore, who has a national reputation among poultry men, will do the judging during the exhibition.

Poultrymen throughout the San Joaquin Valley are giving a new interest to the raising of rabbits, with indications that many thousands will be added to the total number of breeding animals. Students of the rabbit market declare prices will be high for a number of years and that for the present at least there is no danger of an oversupply.

IS IT ROUP?

To the Editor: Can you tell me what to do for roup where sores form in the ears? I have some fine Leghorns and this disease is spreading among them. Some of them seem to entirely recover, then take a second attack. Can anything be put into the ears? The discharge forms in hard, yellow cakes. I have worked faithfully with these chickens and so far have lost none; but seem to be unable to either control or cure the disease.—R. K. H., Pomona

Unless there is that unmistakable rouncy odor, and about the mouths of these fowls, we doubt if they are suffering from roup. We are inclined to the theory that they have been fed a ration too rich in carbohydrates and fats and may not have had a sufficient amount of green feed. This unbalanced feeding results in a condition of the blood favoring the development of a form of catarrh that is not contagious. Fall weather helps to develop this complaint. If our theory is correct we advise the addition of more nitrogenous material to the ration; or to reduce the amount of the kind of feed now supplied; and using every method possible to induce the fowls to eat an unusual amount of green feed. An application of vaseline to the ears to soften the solidified discharge may be advisable but not necessary. With the chief cause of the trouble removed the fowls recover rapidly.

NOT SO BAD!

At the recent poultry show held in the Auditorium, Oakland, Chas. H. Voddan of Los Gatos, who sent seven of his Barred Plymouth Rocks, made the following winnings: First, third, fourth and fifth on cockerels. First hen—second and fifth on pullets, every bird winning. Mr. Voddan has "swept the boards" at all the poultry shows this season with his superb "Rocks." Not so bad, Mr. Voddan thinks.

COMPARATIVE POULTRY RECEIPTS.

According to a statement issued by the Bureau of Markets under date of October 30, 1919, the receipts of poultry products since July to date, as compared with the same period in 1918, were:

	1919	1918
Eggs, cases	199,297	159,851
Poultry, lbs.	499,862	603,817

BLACK TURKEYS.

A correspondent inquired in our issue of November 22d for the address of a breeder of black turkeys. Such address has been furnished us, and if the inquirer will let us know where to forward same we will do so. His letter has been mislaid.

LIKES OUR POULTRY DEPARTMENT.

To the Editor: The weekly visits of your paper are appreciated by us. Especially in the poultry department

have we been concerned, and the hints there given have been very helpful.—Mrs. A. T. M., Herald

EGGS ALL WINTER

Mrs. Charlotte Green writes: "My hens have laid all winter since giving them 'TWO for ONE.'"

World's Greatest Egg Producer

"TWO for ONE" is the marvel of all egg tonics. It is the most remarkable producer of eggs ever known to the poultry world. "TWO for ONE" is making records every day in egg production that were never before believed possible. Flock owners all over the country are amazed with the results. The most experienced poultry experts say they have never seen the like of it.

"TWO for ONE" is not a mere food. It is an egg tonic in the truest sense of the term—a scientific preparation in concentrated tablet form—the result of scientific research and experiment. Every factor entering into the matter of egg production was scientifically studied.

As a result you have in "TWO for ONE" a tonic that conditions the hen for the utmost in laying capacity—that builds muscle and bone—that stimulates active functioning of the hen's reproductive organs—that insures fertile eggs and 100% hatchings—that makes the laggard lay and increases the production of active layers. A tonic that gets more eggs for you winter and summer than you ever thought possible.

\$5000 Egg-laying Contest

Enter our \$5000.000 egg-laying contest. It's free to all users of "TWO for ONE." You not only double your egg production but you can win one of the big cash prizes we are giving every month. Full particulars in every box of "TWO for ONE."

Money-back Guarantee

Don't take our word for it. Every box of "TWO for ONE" is sold under the distinct guarantee that if you are not entirely satisfied you get your money back. Take advantage of this offer and send for a box of "TWO for ONE" today.

Only \$1.00 a box, or, our special offer of \$2.00 for large box containing as much as three \$1.00 boxes—enough for an entire season. This costs you 1-15 of a cent a day, per hen, or less than 1c a dozen for the additional eggs you will receive from your flock.

Kinsella Co., 2349 LeMoine Bldg., Chicago, Ill.

Gentlemen:—I want to increase the egg-laying ability of my hens, make more money out of my chickens and take advantage of the high prices that will be paid during the coming fall and winter. So please find enclosed \$..... for a box of "TWO for ONE" as checked below:

(Check in squares opposite size wanted.)

Small Size (Including War Tax) \$1.00 []

Large Size (Including War Tax) \$2.00 []

This order entitles me to an entry in your \$5,000.00 egg laying contest, of which you are to send me full particulars, and my money is to be returned if I am not entirely satisfied with the tonic.

THE HOME CIRCLE

A PARENT'S PLEA.

My little boy is eight years old,
He goes to school each day;
He doesn't mind the tasks they set—
They seem to him but play.
He heads his class at raffia work,
And also takes the lead
At making dinky paper boats—
But I wish that he could read.

They teach him physiology,
And, oh, it chills our hearts
To hear our prattling innocent
Mix up his inward parts.
He also learns astronomy
And names the stars by night—
Of course he's very up-to-date,
But I wish that he could write.

They teach him things botanical,
They teach him how to draw;
He babbles of mythology
And gravitation's law;
The discoveries of science
With him are quite a fad,
They tell me he's a clever boy,
But I wish that he could add.

—Peter McArthur.

ANNUAL MEETING SAN JOAQUIN CO. FARM BUREAU.

(Written for Pacific Rural Press.)

To those unfortunates who have never lived in the country; who have thought that such a life meant a different attitude toward life in general; who have believed that the farmer's wife must have different interests and accordingly must of necessity be of a different type from the city dweller—to these with their narrow outlook, the annual meeting of the Farm Bureau of San Joaquin County at Lodi must have been a revelation. In addition to the officers of the Farm Bureau centers of the county and the County Home Demonstration Agent, Miss Doris Daniels, many guests were present, the most distinguished being Miss Harriet G. Eddy, of Berkeley, who has charge of the Home Demonstration Department for California, and Miss Frysinger of Washington, D. C., one of the agents of the Federal Home Demonstration Department.

Interested in the Millinery.

Except that the flush of the cheek was induced by nature's rouge, and the sparkle of the eye was in response to the great, shining out-of-doors, in appearance the gathering might have been any up-to-date woman's club of any city. When the two-minute reports from the various centers were given, in almost every case the millinery work done under the direction of an instructor from the University of California was reported. Involuntarily the eye of the outsider rested with critical gaze upon the headwear, first collectively, then individually. But no one would ever have suspected that many of these modish creations were the work of the wearers, and, in not a few cases were made from old materials, with just the needed touch to give individual distinction.

Topics Considered.

Among the topics which have been most generally adopted for consideration and study are those of landscape gardening, with an expert from the University as director; poultry-raising, under a nation-wide authority; and food, textiles and clothing each considered under various subdivisions, with the county agent as instructor.

Utilizing the home-made fireless cooker for making ice-cream and ices, operating iceless refrigerators, creating a home market through the sale

and exchange department, arousing the interest of the girls by forming cooking and sewing clubs, serving the social needs of the community—each of these was taken up in turn.

Miss Daniels stated that in the county eight centers are working on fly-control, five upon clothing projects, four upon food, four upon landscape gardening, and three upon community needs along social lines. "Of course," she explained, "each center is devoting some time to other work as well as to the particular feature upon which it is specializing."

At the Luncheon Table.

After the election of officers, which resulted in placing in the chair for the next year Mrs. C. Webb of Lodi, the men of the Farm Bureau and the women of the Farm Home Department met together at luncheon in the Hotel Lodi. Here the reports of the chairmen of the Farm Bureau centers were briefly made.

Mrs. Castle reported that over two thousand women of the county had been reached through the work of the Farm Home Department and had been awakened to the possibilities just about them.

Women Should Displace Orientals.

Miss Alice Phillips of the Woman's Land Service described the work of that organization and appealed to the farmers to allow women, so far as possible, to take the place of Orientals on the farm. She told of highly satisfactory results wherever the women have served.

Miss Frysinger was one of the main speakers of the afternoon. Some of her epigrammatic sentences follow: "The work of the Farm Bureau is to produce happiness in the people." "The Farm Bureau is not established for men or for women, but to help solve the problems of men and women." "Whatever affects the interests of the farm as a whole affects the women on the farm." "Women can get some things that men can't. In Nevada, after the men had given up, the women got the State engineer started on a dam." "Good roads are for the use of women as much as for men, and it is as much woman's work as man's to get them."

UNIVERSITY EXTENSION STUDIES ON THE FARM.

With the coming of the winter season, the indoor time for farming folk, the Extension Division of the University of California has selected a special list of subjects which may be studied by mail on the farm under the direction of the University instructors at Berkeley.

To the farmer's wife, the Extension Division of the University of California offers a number of excellent courses. Since a baby is nearly always an institution on a ranch, the course on the feeding of infants and children which the Extension Division offers, should be welcomed eagerly. The course deals with the diet of the expectant and the nursing mother and with the diet of children from birth to twelve years of age. Suggestions are also given on planning the family meal and making up the family budget. Special advice is offered on the feeding of school children. Another course given deals with the mental and moral development of children from birth to twelve years of age, a valuable study especially for the rural mother who has not the opportunity the city may afford for child study information.

California women have responded particularly to the opportunity of-

fered by the University for learning millinery and sewing by correspondence. These courses are particularly practical, the student working on model articles from which they can readily acquire the knowledge necessary to make hats and garments for themselves.

Other courses particularly for the men folks on the farm include Electricity for Rural Use; Elementary Hydraulics; Care of Gasoline Automobiles, and others.

The University of California Extension Division, room 301 California Hall, Berkeley, is always ready to give full information on all the study subjects to persons applying.

NO SUGAR FOR THIS SWEETENING.

No sugar is required to make a delicious syrup from apple juice for use on hot cakes this winter, or for beverages next summer, or to sweeten cookies or desserts.

Add 5 ounces of powdered calcium carbonate to 7 gallons of apple juice or sweet cider. Calcium carbonate is the chemical name of powdered chalk and can be obtained at drug stores. Boil the mixture in a kettle or vat vigorously for five minutes. Pour the liquid into vessels, preferably jars or pitchers. Allow it to stand 6 or 8 hours, or until perfectly clear. Pour the clear liquid into a clean preserving kettle. Add to this liquid one teaspoon of calcium carbonate; stir thoroughly. Boil rapidly (220 degrees F.) until the bulk is reduced one-seventh of the original volume, or about one gallon to each seven of the quantity first used. The syrup should then have, when tested in cold water, the consistency of maple syrup. Pour into jars or pitchers, and cool it very slowly.

Pour the syrup into fruit jars, cans, jugs, or kettles. Boil in water bath 10 minutes; in a steam-pressure cooker with 5 pounds 8 minutes.

Remove containers and tighten covers or corks. Invert to cool and test joints. Store for winter use.—United States Department of Agriculture.

Lights with Match!

NO torch needed with this new lamp. Just use a match as with the old time oil lamp. Gives a brilliant, steady, white light of 200 candle power, brighter than the brightest electric light, safer than the safest oil lamp, cheaper than the cheapest candles.

DREADNAUGHT
BLAZING AWAY IN COST-DEFENCE!

THAT PRIVATE ENTRANCE

You remember that there was considerable speculation in some localities, as to how a certain party could negotiate that "private entrance"—the chimney—without running his clothes? He simply couldn't, you know that; but we have put an end to the trouble in solving the heat problem for mother, with a Dreadnaught Oil-Gas Burner.

How about your home—have you corrected the old order of things? If not, better get mother's stocking ready for the greatest little package of cheering comfort ever put on the market, but you'll have to hurry, Daddy Boy—we will do our part and rush the order along the same day received.

Just remember that you and the whole household are going to enjoy a great big part of this cheer-inspiring present for mother dear. Want more information? Ask for our circular—it will be sent by return mail.

SOUTHERN HOMINY RECIPE.

Editor Home Circle: Will you please give a recipe for making lye hominy through the columns of the Press?—H. W. K., Napa.

The following is an old Southern recipe for lye hominy: Make a lye strong enough to eat a feather when boiling hot. Take dry corn well washed and looked over and put into the boiling lye. When the hull is eaten off and the eyes begin to come out, take it out and put into cold water. Wash in several waters to get the hulls off. Return to a clean pot, allowing room for increase in bulk. Boil till done. Salt. Eat in milk or fry in pork gravy.

How many cups per pound will Schilling Tea make?

How large is your cup? How strong do you like your tea? How long do you let it stand on the leaves?

Tell us all this, and we'll tell you how many cups.

We'll say this anyway: Schilling Tea costs less per cup than any tea we know of—and certainly less than any tea selling at a lower price.

There are four flavors of Schilling Tea—Japan, Ceylon—India, Oolong, English Breakfast. All one quality. In parchment-lined moisture-proof packages. At grocers everywhere.

A Schilling & Co San Francisco

HOME PICKLING OF RIPE OLIVES.

(Revised September, 1919, by Prof. F. T. Bioletti.)

These directions are suitable for preparing small quantities for home use.

1. Gather the fruit carefully by hand, without bruising. It is best when cherry red or just turned black. When green, it lacks flavor and oil and when over-ripe, it is too soft and the skin is tough. Soft, shriveled, or frost-bitten olives are unsuited for pickling.

2. Place the olives in an open vessel of glass or earthenware, or a wooden bucket or barrel. Metal vessels should not be used. A wooden cover to fit loosely inside the vessel on top of the olives will prevent the spotting of any olives which float.

3. Make a lye solution of three ounces (three tablespoonfuls) of soda lye to a gallon of water or approximately one pound to five gallons.

4. Cover the olives with this solution, keeping them submerged by means of a wooden cover. Stir and examine the olives every hour. As soon as the skin changes color, cut an olive occasionally to note by the discoloration of the flesh how far the lye has penetrated.

5. When the lye has gone through the skin but only a very short way into the flesh, pour it off into another vessel. This will be in from three to eight hours, according to the olives and the temperature.

6. Expose the olives to the air until the color is darkened and equalized. They should be stirred frequently while exposed. To make them all black requires from one to three days or more, but the flavor is better if not exposed too long.

7. When the desired color is attained, replace the old lye by fresh lye and leave with frequent stirring until it has penetrated to the pit. It must reach the pit or the olives will be bitter, but if left long after reaching the pit, the flesh will be softened and the color bleached.

8. Replace the lye with water which should be changed twice daily, until all taste of lye is removed—about five to seven days.

9. Then place for twenty-four hours in a brine of five ounces (five tablespoons) of salt to a gallon of water.

10. Then heat olives and brine to boiling and pour hot into scalded jars or cans. Cover and seal and place in a pot or washboiler sterilizer and heat for one hour.

N. B.—Certain olives, such as Manzanillo, darken easily when aerated even if they are somewhat under-ripe. Others, such as Mission, will not darken if under-ripe unless exposed for a very long time. Over-exposure injures the flavor. It is better to be satisfied with imperfect color than defective flavor.

Before sterilizing under "10" the brine may be poured out of the jars or cans which are then sealed immediately while still hot and sterilized as above. They keep quite as well without the brine.

Very large or over-ripe olives may soften or blister with this process. To prevent softening, add a little salt (about as much as the lye used), to the lye solution. If the olives commence to soften, remove them to a 3 per cent salt solution (1 lb. salt to 4 gals. water) for 24 hrs. To prevent blistering use repeated treatments with a lye solution of half-strength. Very bitter olives, such as Mission, Manzanillo and Sevillano, require more lye treatment than those with less bitterness, such as Ascolano and Columbella.

LEMON CREAM PIE.

Cream 1 tablespoon of butter with a cupful of sugar. Dissolve a heaping tablespoon of corn starch in a little cold water. Stir over the fire until smooth, then add the butter and sugar. Mix well and remove from the fire. When it is cool, add the juice and grated rind of one large lemon and a well beaten egg. Line a pie plate with good pastry dough. Pour in the mixture and bake. When done, cover with meringue and return to oven to brown. Cook slowly.

Market Comment

Citrus Growers Win in Rate Case.

The California Citrus League has won its case before the Interstate Commerce Commission examiner, sitting in Los Angeles, for a reduction in orange shipping rates. According to the text of the decision, a charge of \$1.08 is set for blanket territory between the Rocky Mountains and Buffalo-Pittsburg. East of the latter line the rate will be \$1.35. This compares with the former charge of \$1.15 and \$1.44 per box. The decision also awards reparation to the orange growers for all excess charges over \$1.08 paid for two years prior to March 23, 1919. These refunds, it is stated, will amount to about \$25 per car. The total to be returned will exceed \$1,000,000. The case is yet to be reviewed by the Interstate Commerce Commission in Washington.

Heavy Shipment of Emperors.

Twenty-two cars of Emperor grapes containing 12,000 drums which have been in cold storage for weeks, were shipped recently from Fresno by the Earl Fruit Co., destined for the holiday trade in the East. The Eastern markets are offering \$6 a drum now, f. o. b. Fresno, for Emperors of this quality. Fred J. Johnson, representative of the Earl Fruit Co. at Fresno, said: "There is a shortage of Emperors, and European grapes are not arriving to any extent on the Eastern markets, and by the time this shipment arrives in New York it will find the market practically bare of California fruits."

Rice Scores a Record Rise.

An advance in the price of rice to a basis of \$6.30 per hundred pounds for fancy No. 1 California sweet rice was the feature of the Sacramento Valley market news last week. The advance came when bids were received for 30,000 bags by the Pacific Rice Growers' Association. The advance is said to be due to the wants of Southern buyers and the demand for rice for export. The Southern rice crop was severely damaged by storms this year, and the shortage in the South is placed at 1,500,000 bags under the forecasted crop. The harvest is ended and all rice is under cover.

Pomegranates Pay Well.

The Tulare County Citrus Fruit Exchange shows that the 1919 pomegranate crop was the most profitable in the history of the industry. The exchange figures show that the high mark for this fruit was \$3.72 per half-box, about \$1 per box over the previous record of last year. For the season, returns were \$2.72 per box, the highest average to date.

Cherry Growers Organize for Selling.

As a result of the low prices in the East this season, the California Co-operative Canneries were induced to can cherries for the growers. An average price of 12½ cents a pound was paid to the growers for all the Royal Ann cherries packed. The growers are now carrying on organization work with a view to handling their own crop next year.

Peach Growers to Sell Surplus.

The manager of the California Peach Growers gives out the information that there is not to exceed 1,000 tons of peaches after filling orders on hand, and the board of directors is authorized to sell this surplus at prevailing prices.

Hops Contracted at 30c and 36c.

Contracts filed for record in Sacramento last week showed purchases of hops in the Sacramento County districts at prices ranging from 42 cents for 1920 hops to 30 cents for 1922 hops. The average shown by the contracts was 36 cents.

Celery Soars with the Rest.

Record prices are being obtained by the vegetable growers of Superior California this year. The California Vegetable Union reports heavy celery shipments from Walnut Grove and Antioch, and that prices are higher than those of last year.

THE MARKET REPORTS

SAN FRANCISCO.

San Francisco, December 10, 1919.

BARLEY.

Brewing and shipping barley, of which there are not large quantities on the market, advanced somewhat this week. The feeding description is unchanged with a fair demand for immediate delivery. Buying of feed barley, however, is mostly in small quantities.

Feed \$3.40 @ \$3.50
Shipping \$3.55 @ \$3.60

OATS.

Red feed advanced this week in sympathy with the continued strength in barley. There is very little of the seed description on the market at present, and a considerable demand would advance its quotations materially.

Red feed, per cwt. \$3.10 @ \$3.25
Red for seed Nominal
Black for seed \$3.25 @ \$3.50
Recleaned Red or Black for seed Nominal

CORN.

California yellow corn developed considerable weakness on account of the lack of demand. Continued rains and the development of green feed will probably send the price of corn to a lower level.

California \$3.40 @ \$3.50
Egyptian, choice \$3.40 @ \$3.50

HAY.

Receipts of hay this week were 1,002 tons compared with 874 last week. These receipts were about equally divided between water and rail shipments, but the rail shipments as for the past few weeks have been exclusively for Government account. The car situation throughout the State continues in a deplorable condition and there seems to be small chance for relief in the near future. The general rains which still continue have come in the nick of time and their value cannot be overestimated. This is especially true to stockmen, as all feed on the ranges was practically gone. It is believed as a result of the rains a considerable amount of hay which otherwise would have been used for feeding stock will be used for other purposes and an active market for this hay could be developed if cars were available.

No. 1 Wh. sk. or Wheat & Oat \$21.00 @ \$25.00
No. 2 Wheat, or Wheat & Oat \$20.00 @ \$22.00
Choice Tame Oat Hay \$23.00 @ \$26.00

Wild Oat Hay \$19.00 @ \$22.00
Barley Hay \$19.00 @ \$23.00
No. 1 Alfalfa Hay \$21.00 @ \$26.00
Stock Hay \$21.00 @ \$26.00
No. 1 Barley Straw, per bale 50 @ 80

FEEDSTUFFS.

The feedstuff market is stronger, although purchases have not generally been in large quantities. It is evident that consumers are buying from hand to mouth, while awaiting the development green feed on the ranges. The number of purchases, however, is large and prices of rolled oats and rolled barley advanced in consequence. In consequence, cracked corn quotations fell away in sympathy with the decline in California.

Roller Oats \$66.00 @ \$68.00
Roller Barley \$70.00 @ \$72.00
Cracked Corn \$79.00 @ \$81.00
Alfalfa Products \$38.00 @ \$45.00

POTATOES, ONIONS, ETC.

Potatoes are strong at higher prices. There is a shortage of both potatoes and onions in the State, according to dealers, due to a short crop, and this situation is not helped by the lack of transportation facilities in many places. While it is believed that prices of both may fall away somewhat about the holiday season, higher prices are predicted for after the first of the year. According to statements made the crop of root vegetables this year has not been up to normal, and this always influences the late winter and early spring prices of potatoes and onions. The tone of the general vegetable market has been quiet during the past week.

String Beans, lb. 12 @ 15c
Peas, lb. 15 @ 25c
Carrots, per sack 75c @ \$1.00
Celery, crate \$5.00 @ \$6.00
Cucumbers, box Nominal
do, Hothouse \$2.00 @ \$3.00
Lettuce, per crate \$2.25 @ \$3.00
Tomatoes, Stone \$1.00 @ \$1.50
Hubbard Squash, sack \$1.25 @ \$1.50
Pumpkins, sack 75c @ 1.00
Potatoes, River fancy, cwt. \$3.25 @ \$3.50
do, Choice, cwt. \$2.75 @ \$3.25
do, Salinas, cwt. \$4.00
do, Oregon Gem, cwt. \$3.75 @ \$3.90
do, Oregon Burbank, cwt. \$3.40 @ \$3.60
do, Idaho Gem, cwt. \$3.50 @ \$3.75

Special Livestock Market Report

San Francisco, Dec. 10, 1919.

CATTLE—The cattle market seems to be recovering from its recent somewhat alarming decline, and prices are reaching higher levels again. This week's quotations denote an upward movement. The bulk of the cattle now coming in is from Nevada and Northern California, and the supply is not overabundant. In the East the cattle market is somewhat erratic with an upward tendency.

Steers, No. 1, 1000-1200 lbs. 10½ @ 11½c
do, No. 1, 1200-1400 lbs. 10½ @ 10½c
do, 2nd quality 9 @ 9½c
do, thin 7 @ 8c
Cows and Heifers, No. 1 8½ @ 9½c
do, 2nd quality 7½ @ 8c
do, thin 4 @ 6c
Calves, Lightweight 12½ @ 13c
do, medium 11 @ 12c
do, heavy 8 @ 10c

HOGS—The hog market shows signs of recovering from the late decline, following unusually heavy receipts. With the exception of very lightweights quotations have been moved upward. Too much soft stuff is arriving. The Eastern market is unstable.

Hogs, hard, grain-fed, 100 to 150 lbs. 14½c
do, 150 to 225 lbs. 16c
do, 225 to 300 lbs. 15c
do, 300 to 400 lbs. 14c

SHEEP—The mutton sheep market is improving. Demand is better and supply continues to be limited to feed lots mainly. Quotations are fractionally higher.

Lambs, yearling 10 @ 11c
do, milk 12 @ 13c
Sheep, wethers 9 @ 10c
do, ewes 6 @ 6½c

Los Angeles, Dec. 9, 1919.

CATTLE—Steers are steady and in fair demand. Cows dull and quoted lower. Receipts only fair.

Per cwt. f. o. b. Los Angeles:
Beef steers, 1000 to 1100 lbs. \$9.50 @ \$11.00
Prime cows and heifers \$8.00 @ \$9.50
Good cows and heifers \$7.00 @ \$8.50
Canners \$4.50 @ \$5.00

HOGS—Prices remain unchanged. Receipts are good but market is weak with fair demand reported.

Per cwt. f. o. b. Los Angeles:
Light \$14.00 @ \$16.00

Heavy average 225 to 275 lbs. \$13.00 @ \$14.00
Heavy average 275 to 350 lbs. \$11.00 @ \$12.50
Rough docked 20 lbs. piggy cows 40 lbs. and stags, 40 per cent.

SHEEP—Lambs are in good demand and quoted lower this week. On sheep the market is dull.

Prime wethers \$8.50 @ 9.50
Yearlings \$8.50 @ 9.50
Prime ewes \$8.00 @ 8.50
Lambs \$12.00 @ 13.00

Portland, Ore., December 8, 1919.

CATTLE—Steady; receipts, 2317. Steers, best, \$9.50 @ 10.50; good to choice, \$9.00 @ 9.50; medium to good, \$8.00 @ 9.00; fair to good, \$7.00 @ 8.00; common to fair, \$5.50 @ 6.50; choice cows and heifers, \$8.50 @ 9.00; good to choice, \$7.00 @ 8.50; medium to good, \$5.50 @ 7.00; fair to medium, \$4.00 @ 5.50; canners, \$3.00 @ 4.00; bulls \$5.00 @ 7.00; prime light calves, \$12.50 @ 14.00; heavy, \$7.00 @ 12.00; stockers and feeders, \$8.00 @ 9.25.

HOGS—Lower; receipts, 2175. Prime mixed, \$15.50 @ 15.75; medium, \$14.00 @ 15.50; rough heavies, \$13.00 @ 14.00; pigs, \$12.50 @ 14.50.

SHEEP—Higher; receipts, 1488. Eastern lambs, \$13.00 @ 13.50; valley, \$11.00 @ 13.00; feeders, \$10.00 @ 11.50; yearlings, \$9.50 @ 10.00; wethers, \$9.00 @ 9.50; ewes, \$6.50 @ 7.50.

DRESSED MEATS.

M. & L. prices are:
Steers, prime small 16½c
do, heavy 16c
Cows 12½ @ 14c
Lambs, Spring, light 23c
do, heavy 19c
Wethers, light 18c
do, heavy 17c
Ewes 12 @ 13c

Western Meat Company prices are:
Steers, No. 1 15½ @ 16½c
2nd quality 15 @ 15½c
Cows and heifers 13 @ 15c
Calves (as to size, etc.) 15 @ 22c
Lambs, Suckling 22 @ 23c
do, yearling 19 @ 20c
Sheep, wethers 16 @ 18c
do, ewes 14 @ 15c
Hogs 23 @ 24c

Special Citrus Market Report

Los Angeles, Dec. 8, 1919.

There still remains on the market about 1200 cars of Valencia's yet to be shipped. Best grades are quoted at \$4.60 per box f. o. b.; other grades, \$4.10 down to \$3.85, according to quality and district. It probably will be a great advantage to the orange growers that the Valencia crop is late, as it places an available supply of California oranges at the disposal of the Eastern trade for holiday use. Up to date Central California districts have shipped 1,516 cars of navels this season, as against 1,181 cars to the corresponding date last season. F. O. B. California, quotations range from \$4.35 to \$3.85 for Tulare county navels, depending upon size. Shippers, principally from Hemet, Riverside, and the Redlands district, have been enabled to get out a good supply of fruit on holiday orders so far, due to the good refrigerator car supply. As the packers and shippers of Orange county are still busy with the Valencia's they will ship practically no holiday navels.

Foreign lemons are now arriving at Eastern ports in quantity, and it is reported that between 30,000 and 35,000 boxes will be available for sale during the next 30 days. The local market is good for medium-sized fruit.

The total shipments of cars of oranges from Southern California to date were 2,320 and 407 cars of lemons, while from Central California, 1,516 cars of oranges and 76 cars of lemons were sent out.

do, Sweets, new, lb. 4 @ 4½c
Onions, Brown, sack \$4.75
do, Yellow, sack \$4.50
Garlic, lb. 20 @ 22c

BEANS.

Although it cannot yet be called active there was a better demand for beans this week and prices for bayos, Mexican reds and small whites of the new crop were advanced. The Lima bean association also raised the prices of limas to \$14.75, although this variety was not in large demand at the former price. No local sales of limas are reported at the advanced price, which in comparison with the prices of other beans is considered too high by the local dealers.

Variety	Old crop	New crop
Bayos	\$7.00 @ 7.25	\$9.25 @ 9.50
Blackeyes	\$5.75 @ 6.00	6.25 @ 6.40
Crabapple	\$6.00 @ 6.25	7.25 @ 7.75
Pinks	\$5.50 @ 5.75	6.15 @ 6.40
Red Mexican	\$5.00 @ 5.75	7.50 @ 7.75
Tepary	\$2.50 @ 2.75	
Garbanzos		9.50 @ 10.00
Large Whites	\$5.25 @ 5.50	6.10 @ 6.25
Small Whites	\$6.00 @ 6.25	6.40 @ 6.50
Limas		\$14.75
do, Baby		13.00

POULTRY.

Receipts of poultry during the past week have been comparatively heavy. Prices have been well maintained and the demand has been excellent. On account of the rain it is anticipated that arrivals in this market will be comparatively light during the next week, and fryers, young roosters, ducks and geese are expected to sell at the top quotations given below. In fact the quotations on these varieties mentioned sold most of the past week at from 1 to 2 cents below the top quotations given and the use of these figures this week is more or less anticipatory of next week's prices.

The demand for turkeys has been light, but next week this will show decided increase in anticipation of the holiday. It is predicted that turkeys will not reach the high level for Christmas that they reached at Thanksgiving time, as the supply will be much heavier, and as there will be no general holiday following closely the stock must be sold or sent to storage, or the risk taken of holding for a higher market.

Broilers, 1½ lbs. under 36 @ 40c
do, 2 to 3 lbs. 32 @ 36c
Fryers, 2 to 3 lbs. 33 @ 34c
Hens, extra, per lb. 34 @ 35c
do, Leghorns 30 @ 33c
Smooth young roosters, per lb. (3 lbs. and over) 32 @ 33c
Old Roosters, colored, per lb. 22c
Turkeys, dressed, young spring, lb. 48 @ 50c
do, live 45c
Geese, young, per lb. 30 @ 32c
do, old, per lb. 28 @ 30c
Squabs, per lb. 60 @ 65c
Ducks, young 32 @ 34c
do, old, per lb. 30c
Belgian hares, live, lbs. 16 @ 20c
do, dressed 22 @ 25c
Jack Rabbits \$3.50 @ \$3.60

BUTTER.

The butter market was firm this week with practically no change, the week's fluctuation being only one cent. Considerable butter is coming out of storage, but balances on hand show nearly 400,000 lbs. more than last year at this time. This will last for about four months at present rate of withdrawal from storage.

Extra	Thurs.	Fri.	Sat.	Mon.	Tu.	Wed.
.....	63½	63½	63½	64	64½	64½

EGGS.

Extra eggs took another sensational tumble today reaching 73½ cents with the commission deducted. This is 11½ cents below the high for the season and 9½ cents below the close of a week ago. A peculiar thing about today's drop is that it is in the face of a steady to strong market in the east and light receipts locally. Another peculiar thing about the drop which extended to both extra pullets and undersized was that storage eggs still sold at 60 cents. The most plausible explanation of the decline in extra prices is the car shortage which is making it difficult to obtain cars for any purpose. With the settlement of the coal strike and resumption of normal railroad service it may be possible for points of production to make further eastern shipments, and in that event a rapid increase in price may be anticipated. Regarding present prices it will be noted at a week ago there was 14 cents difference between extras and pullets, while today there is 6½. This is more nearly the usual differential between the two descriptions than has existed for some time, and if shipments can not be made to eastern markets about this difference in prices will be maintained.

Extras	Thurs.	Fri.	Sat.	Mon.	Tu.	Wed.
.....	81	81½	80½	80½	78	73½
Ex. pullets 70	71½	70	71	71	72	67
Undersized, 66½	67	67	67½	67½	67½	67½

CHEESE.

Trading was light in cheese this week, although there were slight advances in both fancy flats and fancy Y. A. The Oregon descriptions showed no changes during the week.

California Flats, fancy 30c
do, Firsts 27c
Y. A. Fancy 35c
Oregon Triples 30½c
do, Y. A. 34c

FRESH FRUITS.

There was a fairly active market for fresh fruits with apples as the leaders. California pippings sold somewhat lower, but otherwise there were no changes. Pears were weak and sold at lower prices this week. There were also somewhat lower prices on grapes, persimmons and pomegranates.

Apples, Jonathan, Oregon \$2.50 @ \$3.00
do, Spitzenberg, Oregon \$3.50 @ \$3.50

do, Bellflower	Nominal
do, Pippins, Calif.	\$2.00@2.25
do, Lady, Calif.	\$3.50@4.00
Quinces	\$1.00@1.50
Pears	\$1.50@3.00
Grapes	\$2.00@2.25
Persimmons, box	\$1.25@1.75
Pomegranates, 1/2 orange box	\$1.50@2.00

CITRUS FRUITS.

The Valencia season is rapidly drawing to a close, for with an abundance of navel in the market there is later demand for Valencias. It is likely that a bulk of the stock in this city will be shipped east and disposed of. There was no change for the best navels, although some grades sold as cheap as \$3.50.

Oranges, Valencias	\$3.00@4.50
do, Navels	\$3.50@5.00
Lemons, fancy	\$5.00@5.50
do, choice	\$4.00@4.50
do, standard	\$3.00@3.50
Grapefruit	\$2.50@3.00
Mandarin, box	\$2.00
Tangerines	\$2.50@3.00

DRIED FRUITS.

The temporary activity of last week in dried fruits has passed and left the market quiet but firm at previous quotations. This is the usual quiet season in dried fruits and the present may be said to be a normal market.

Apples	17@18c
Pears	16@18 1/2c
Apricots	21@28c
Prunes	11@13c
Figs, Adriatic	12@18c
do, Calimyrna	15@21c

HONEY.

While there is a continued fair demand for honey in this market the association decided to lower the prices somewhat in light amber and amber. While these concessions range from 1/2 cent to 1 cent they give evidence of an effort to clean up the stocks of these descriptions.

Water White	18@20c
Light Amber (Mountain)	15 1/2@17c
Amber (Alfalfa)	14 1/2@15 1/2c

RICE.

There is little change in the rice situation. Probably more than half the California crop of clean rice has been sold and the mills are running full blast. For this reason it is expected that the millers' season will end earlier than last year, and the entire crop will probably be disposed of by April.

It is the fashion these days to kill gophers and squirrels with poisoned grain. This is a mighty good fashion, but those who have a surplus of the grain stored should be very careful to have it in a place that is safe. A Tulare County farmer recently lost two horses and 5 good brood sows by their gaining access to such poisoned grain. Be sure it is where children or animals cannot get to it in any way.

Nearly 600 acres of asparagus have been contracted to be planted on land recently sold to R. R. Bellingall by the California Delta Farms of Contra Costa county. The upper six inches of soil are to be run through a steaming machine to kill weed seeds and insects.

LOS ANGELES.

Los Angeles, Dec. 9, 1919.

BUTTER.

Prices steady and unchanged since last week. Market reports demand good and receipts slightly above those of a week ago, being 253,000 lbs.

Fresh, California extra creamery	67c
do, prime first	65c
do, first	64c

EGGS.

Case counts decline 2c on the dozen while pullets advance 2c. Fresh ranch unchanged. Receipts little under last week. Demand is very good. Receipts for the week, 463 cases. Fresh ranch, extras

do, case count	77c
do, pullets	64c

POULTRY.

Broilers show a decline in price of 6c. All other prices are the same as quoted last week. The demand is somewhat lighter on almost everything, and receipts are fair.

Broilers, 1 to 1 1/2 lbs.	40c
Broilers, 1 1/2 to 1 3/4 lbs.	40c
Fries, 2 to 3 lbs.	29c
Hens	31@33c
Roosters (soft bone), 3 lbs. and up	29c
Stags and old roosters, per lb.	19c
Turkeys	35@37c
Ducks	25@33c
Geese	25c

FRUITS.

Apples now make up pretty much the offerings and there is a splendid demand for them. Grapes, pears and quinces are now out of the market, except those remaining in cold storage. Prices are firm and receipts fair. Japanese Persimmons, lb. 8@14c. Apples—Bellflower, 4 tier \$1.75@1.80. do, Jonathan, packed box \$2.75@3.00. do, Red Parnell, packed box \$1.75@1.85. do, White Parnell, packed box \$2.00@2.25. do, Yellow Newtown Pippins, pkd box \$2.00@2.25. do, Spitzenburg, packed box \$3.00@3.50.

VEGETABLES.

String beans, lima beans and tomatoes will soon be off the market, frost having killed the vines. Potatoes and onions are higher and in very good demand. Cabbage and cauliflower firm and selling fairly well. Celery also in demand and prices steady.

Potatoes, Northern Burbanks	\$3.50@3.75
do, Idaho Russets, cwt.	\$3.50
Sweet Potatoes	\$2.25@2.50
Onions, Stockton, yellows, cwt.	\$3.85@4.00
do, White Globe, cwt.	\$3.75@4.00
do, Australian Brown	\$4.50@4.60
Cabbage, per 100 lbs.	\$2.50@3.00
Lettuce, crate	\$2.00@2.25
Rhubarb, per 30-lb. box	70c@1.25
Summer Squash, lug	\$1.50@1.75
Peas, per lb.	12@17c
Cucumbers, local, lug box	\$1.00@3.00
Peppers, Bell, lb.	6@8c
Casabas, lb.	1 1/2@2c
Celery, crate	\$4.00@4.25
Cauliflower, crate	\$2.00@2.25

BEANS.

Very little doing in this market. All prices the same as quoted last week.

Limas, per cwt.	\$12.00
Large white, per cwt.	\$6.25
Small white, per cwt.	\$6.50
Blackeyes, per cwt.	\$5.00@5.25
Tepary, per cwt.	\$3.00@3.25
Pink, per cwt.	\$6.25

HAY.

Receipts are light with good demand reported. All prices show sharp advance over last week's quotations.

F. o. b. Los Angeles

SANTA CLARA WATER CONSERVATION MASS MEETING.

At a well attended meeting of the Board of Trustees of the Farm Owners' and Operators' National Association (Santa Clara Unit), December 6, it was decided to hold a mass meeting of the growers of the valley Saturday afternoon, December 20, at 2 o'clock. Senator Herbert C. Jones has been secured to address this meeting and another well-informed speaker will be present to give information on the subject of irrigation and drainage as handled by the federal government. All farmers, whether members of the Farm Owners' and Operators' Association or not, are invited to attend this mass meeting, and any suggestions they may have to offer or questions they may wish to ask will be welcomed. The meeting will be held in the San Jose Chamber of Commerce Convention Hall.

INCREASE IN WOOL IMPORTS.

Imports of wool during the five-year pre-war period, 1910-1914, averaged 207,583,742 pounds annually, or something less than half the present imports, according to official announcement. As the population of the United States has been increasing so have the imports of wool. For the fiscal year ending June 30, 1918, this country imported 379,129,934 pounds. During 1919, the total importation amounted to 424,414,644 pounds, or more than double the pre-war average. From January to August, inclusive, of the present year (eight months) more wool was imported than during any of the pre-war years mentioned, and if the present average monthly imports of 36,238,982 pounds is maintained throughout the remaining months of this year, the United States will import more than 430,000,000 pounds during the present calendar year.

INCREASED STOCKS OF HIDES.

Total holdings of hides and skins in the United States for the month of October were 40,678,536, according to late reports received by the Bureau of Markets, U. S. Dept. of Agriculture, from packers, dealers, importers and tanners. This is a net increase of 3,308,558 over September. Holdings of goat and kid skins showed the largest total increases, while cattle hides and calf skins showed decreases.

BEST BUTTERS IN DEMAND.

The butter market rules steady both East and West, supply about offsetting demand. There is a steady call for the best grades, notwithstanding high price levels, and creameries specializing on high grade butter have no trouble in disposing of their output.

MISCELLANEOUS.

MAKE YOUR OLD ROOF NEW
SUPERCOTE & PROTEN
THE LEAK-PROOF TWIN

Absolutely guaranteed to stop all leaks in one application. Do it yourself. No need of an expert. Mail inquiries solicited. E. L. HUBBARD, Factory Agent, 175 Grand Ave., Oakland, Lakeside 2632.

CORY'S THORNLESS MAMMOTH BLACKBERRY—large berry, small seed; ripens early. The kind you have been looking for. Good, strong plants now ready. Write for descriptive price list. Wm. Mortensen, R. A. Box 209, Lodi, Cal.

ASPARAGUS ROOTS—Palmetto bright green, 40 cents per dozen; \$3.00 per hundred. Seed corn, Country Gentlemen, 10-lb. lots, 15 cents per lb; 12 1/2 cents per lb. in 100-lb. lots. Address R. M. Graham, R. F. D. No. 1, Box 83, Colton, Cal.

REMANUFACTURED PIPE.

All sizes standard pipe and wrought iron screw casing. All kinds of fittings. Guaranteed good as new. Write for prices. Wellesbaum Pipe Works, 180 Eleventh street, San Francisco.

SHORTHORN HERDSMAN WANTED—Married man with experience in care and feeding of beef cattle and fitting for shows. State references and wages in first letter. Fair Oaks Ranch, Willits, Cal.

WANTED A MAN to fill position as herdsman. Must be experienced and wide awake. Steady position. Call or write, stating references. Shoreacres Dairy, San Leandro, Cal.

MADE OF REDWOOD, Hawley's Perforated wooden well casing, the best and cheapest well screen made. Send for descriptive circular. G. M. Hawley, La Mesa, California.

ALL SIZES OF PIPE and screw casing, both new and second-hand, dipped and undipped. Guaranteed. Prices right. Shecter Pipe Works, 304 Howard St., San Francisco.

\$2,000 HOLT "30" FOR SALE—in good condition; tracks almost new; and a five-Disk Moline plow. Address: J. M. Nelson, 16 N. First Street, San Jose, Cal.

WANTED—Position as herdsman or superintendent stock ranch. Experienced A. B. O. work, showing, calf raising, and in growing alfalfa, corn and beans. Best references. Address 2932 Eye St., Sacramento.

WANTED—Layne & Bowler, Byron Jackson, or Johnston deep well pump, capacity 1,000 to 1,500 gallons per minute. Prefer the direct connected with electric motor. Geo. A. Smith, Corcoran, Cal.

TUBA TRACTOR with Diesels, Flows and Harrows in perfect shape at sacrifice. Owner, L. Jennings, 2904 Piedmont Ave., Berkeley, or Pengilly Clark, Stockton.

HOLT 30-CATERPILLAR—new tracks, engine recently overhauled. 5 disc plow, 8-ft. double disc harrow. A bargain. \$2,000. Fair Oaks Ranch, Willits.

FIRST CLASS DAIRYMAN, married, wishes position as herdsman or dairy foreman, lifetime experience; best of references. Box 1730, Pacific Rural Press.

WANTED TO LEASE on shares with option to buy 10-20 acres of bearing orchard or land suitable for an orchard. Box 1740, Pacific Rural Press.

FORDSON TRACTOR—Used very little and in good condition. Oliver tractor plow. A bargain. \$600. L. M. Utery, King City, Cal.

CROLEY'S BALANCED HOG FEED—The cheapest feed to fatten hogs. Write Geo. H. Croley, Townsend St., San Francisco, Calif.

BURBANK'S Thornless Blackberry plants. Price reasonable. Orders taken for spring delivery. Variety Farm, Clovis, Cal.

FOR SALE CHEAP—K handpower stump-puller. New complete outfit. Edward Haven, Morrisish Ave., San Jose, Cal.

SUDAN—We want to buy Sudan grass seed. Send us samples. Bomberger Seed Co., Modesto, Cal.

WANTED—Used 6-ft. Double Disk in A-1 condition. 142 R. B. Alum Rock Ave., San Jose.

COUNTRY LANDS.

An encore for Encore!

Tender, tempting, golden-brown pancakes—with that “come again” flavor—that’s Encore! It’s surprising how an Encore breakfast starts the day off right. For here are pancakes that are *uncommonly* delicious—that *really satisfy* the inner man!

What’s more—Encore Pancakes are the easiest and quickest to make. Because you have the right pancake mixture *to start with*. Everything you need to make good pancakes is all there, ready for you. There’s no fuss, no muss; you just add an equal quantity of cold water and bake on a hot griddle.

Ask for Encore Pancake Flour in the familiar Sperry Red Package—at the store where you do your trading.

SPERRY FLOUR CO.

GENERAL OFFICES, SAN FRANCISCO
U. S. A.

Ten mills and forty-four distributing points on the Pacific Coast

A71

Leave it to your men-folk to notice the difference! For Encore Pancakes are always light and tempting—never “flat” or soggy. The kind of pancakes that make ‘em hanker for breakfast time!

Grand Champion Comes Out of the West

Written for Pacific Rural Press by Thos. F. McConnell.

INCE TIME IMMEMORIAL the East has looked down upon the West, at least, "so long that the memory of man runneth not to the contrary." This, however, is due, not only to those in the East, but those who have gone West, that look back wishfully and think longingly of the good old times in the eastern home, even though these same good old times are only a figment of the imagination. It was thought nothing really good could come out of the West, no matter what it was—man or maid, horse or cattle beast.

"The world do move" in the livestock breeding and feeding business. Carpenter & Ross of Mansfield, Ohio, the great Shorthorn breeding and importing firm, on their return recently from England, report a scarcity of just the kind of bulls they wished to bring back. We will not say that bulls are not so good in England as they were formerly, but our standard of excellence is higher in the States, and it takes better bulls to satisfy the breeders in this country.

The University Farm at Davis has taken fat cattle, sheep, and swine to the Chicago International Livestock Show for the third time this year, and while they did not get grand champion steer or wether, they did get champion Aberdeen Angus and reserve grand champion steer, and many other top prizes as well. This is not because the stock is not as good in the East as in former years, but because the Western stock is better. Time was when California cattle produced nothing for the markets of the world but hides and tallow. Some change!

The veteran Poland-China breeder of Kings county, California, Mark Bassett, shipped a pen of five barrows, over six months and under one year old, to the Chicago International this year, and won second in class. Twenty years ago this could not have been done, although no hogs were as good then.

Seven miles southwest of Redwood City, California, there is a breeding farm that some years ago was devoted to raising Thoroughbred horses. Nestling in among the hills in a narrow valley, it raised good horses. None better. Times changed, and it was thought that a place that could raise good horses perhaps could raise good cattle. So some Shorthorns were bought. Not the long-legged, coarse kind, but those bred strong in the blood of the cattle of that peer of all beef Shorthorn breeders, Amos Cruickshank, the Scotchman, who did as much or more to popularize this breed as a beef animal than any other one man. They commenced to raise cattle in the usual Western way, although they fed better than most Californians. They knew plenty of good feed was necessary to raise winning thoroughbreds, therefore, the best-bred cattle in the world would not produce winners without plenty of good feed.

The Ormondale ranch, as said before, is situated in the foothills, but included in the land is some rich bottom land that grows as good silage corn as could be found anywhere. Given corn silage, good hay, and Scotch Shorthorns, with a manager who knows his business, and the result, sooner or later, is sure to produce something worth while.

We will see if this is true. The herd sire at Ormondale is Golden Goods, Jr., a bull that to look at impresses one with massiveness and constitution, without coarseness. This bull has great length and depth, with width

enough to be symmetrical. In a herd of thirty of more Shorthorn matrons, all of which are good, there is one cow called "My Sweetheart" that has plenty of quality and is a good mother as well.

Some three years or more ago she was bred to Golden Goods, Jr., and the result of this mating was a red heifer calf that bore such a striking resemblance to her dam that she was called Little Sweetheart. This calf early showed evidence of being better in conformation than either sire or dam. The sweet, nutritious grass on the hills, the corn silage, and fine oat hay of the region, while not making a scientific ration, perhaps, do produce milk and grow calves. It was no exception in this case, for the calf grew apace, and in the spring of 1919 there was a Shorthorn auction sale held in Davis under the auspices of the California Shorthorn Breeders' Association. The Ormondale Company consigned a number of heifers, but reserved Little Sweetheart, although at one time it was thought she might be put in and sold.

Among other breeders of Shorthorns at this sale was T. S. Glide of Davis, who noticed the high quality of the cattle consigned by the Ormondale Company, and remarked

about it to Jas. McDonnell, the manager. This conversation led Mr. Glide to visit Ormondale shortly afterward, and while there he saw Little Sweetheart and bought her. Taken to Hillcrest Farm, the home of Mr. Glide, and placed with the rest of the show herd, her fitting commenced immediately. Given the best of care she rapidly rounded into show form, and when seen by the writer the first of August, impressed him so favorably that he told Mr. Robertson, the herdsman, "that some one was going to be disappointed at the State Fair, but it would not be them." She was shown for the first time at the State Fair this fall, and won first in class, senior champion, and then grand cham-

Little Sweetheart, the champion Shorthorn cow of the world—and she looks it all over.

pion female of the breed in strong competition.

She was next shown at the Los Angeles Livestock Show, where she repeated her performance, but with hardly as strong competition as at the State Fair. With an interval of only a week she was in the ring again at the California International at San Francisco, and repeated her previous performances. Mr. Glide entered his herd at the Pacific International Livestock Show at Portland, Oregon, and Little Sweetheart in the Shorthorn sale at that place. In the meantime she had been entered at the Chicago International Livestock Show.

Some had their doubts as to her winning when she came to Portland, as that is a Shorthorn country with many good herds. However, it made no difference, and she was made grand champion female of the breed again in very strong competition.

Now came the sale where she was the top female, selling for \$2,200, and going to the Chicago Importing Company.

She then was shipped to Chicago, and while all breeders of the Coast hoped, some "took counsel of their fears" and did not believe she could win. Some thought they would not let a Western cow win, but she did, and became grand champion Shorthorn female of this greatest of all livestock shows. Thus we see that the "East" does not have a monopoly of the best ones. California, however, must not rest on her laurels, but in years to come excel the past.

DECEMBER RAINS.

DECEMBER IS demonstrating its right to be considered a good rainy month on its own account. There seems to be some doubt about this in the general farming mind and one is apt to hear that if the season is rather shy of rain in its earlier part there is no use of expecting rain until after the holidays. This assumption is unwarranted, as we shall presently show, and it is an unfortunate assumption because it is apt to mislead people into the idea that if conditions for sowing and planting have not arrived before December 1, they need not be expected until January—which experience has shown to be too late for some grains and forage plants in some parts of the State. The fact is that December may start planting activity by its own rainfall and therefore one should not throw the month into the meteorological waste-basket. December has done this on its own account this year, for the rains since our last issue have covered the State, have widely brought the soil into working condition and have piled up an unusual amount of snow in the mountains for next summer's water supply.

It is true that if the whole season runs dry December will usually be found as bad as the rest, but its record as a rainy month is good, nevertheless, for the normal December rainfall is about 4½ inches in San Francisco. What we are contending for at this time, however, is that there is much to be reasonably expected of December, although the preceding months may have shirked their agricultural duty. Here are nine years during which December went above its normal rainfall and four of them in which December made its greatest record ever, and in these very years the preceding rainfall was either light or almost absent, viz.:

Year	Before Dec. 1	In December
1851	3.38	7.10
1855	.07	5.76
1858	.07	6.14
1860	3.46	15.16
1866	3.05	10.69
1867	3.05	10.69
1871	2.90	14.36
1880	.38	12.33
1884	2.66	9.01
1906	1.96	6.90

These records ought to hush up the croakers who claim that if December comes in very dry there is no hope of an opening of the working season for a month or more. Of course the lesson is that prophecies of evil are apt to be false and that the only reasonable course for a wideawake California farmer to adopt is one of watchful waiting and readiness to jump in whenever the right condition arrives in the clouds and on the earth.

SPOTS AND PLANETS NOT IN IT.

There is a by-product of the little investigation we have made above which reaches farther than agricultural significance and that relates to those spotting and conjuncting prophets who are exciting people with forecasts of great storms this month, on the claim that the planets are combining to pull the sun's atmosphere away from him. Such claims are faked, and journals which make a specialty of publishing the gloomy forebodings of such fakers

ought to be prosecuted for disturbing the public mind to serve their own publicity purposes. There are at least two lines of attack upon these deceivers who "creep into houses and lead captive silly women laden with sins." One way is to demonstrate that heavy storms come of their own accord and from their own terrestrial causes when there are no relations of spots and planets which can be faked to account for or predict them. Stellar conjunctions did not exist when the storms brought an average of a third or half an inch of rain for all the days of the Decembers, as noted in the table. The other way is to demonstrate that such stellar conjunctions have often occurred before and no earthly disturbance has been caused. This demonstration is had in the declarations of Director Campbell of the Lick Observatory, who has said just that thing about conjunctions. The same thing is set forth by C. F. Marwin, Chief of the U. S. Weather Bureau, who has telegraphed from Washington denouncing "Alarming predictions of severe atmospheric and other disturbances, prophesied to occur between December 17 and 20." Mr. Marwin adds:

"The conjunction of certain planets and their consequent speed influence on the sun, on which the predictions are ostensibly based, have occurred before without any unusual conditions resulting, and there is no ground for expecting any extraordinary happenings at this time."

And that ought to settle all the cock and bull stories about the planets pulling away the sun's covering and leaving him spotted before the world.

The Spirit of Christmas is Good Will.
The essence of Good Will is Unselfishness.
The elements of Unselfishness are: Kindness, Fairness, Justice. & **These also are the elements of Democracy.**
May this Christmas be big with promise for Democracy.

—The Value World.

The fact is that the sun will keep his shirt on from December 17 to 20 just as he does at all other times, and we advise all timid people to do the same. They may get wet, though, for December is a month of storms as we have shown, unless they act like reasonable people and come in out of the wet!

WHEAT OR BARLEY, WHICH?

There has been printed widely in the country papers a statement by Dean Hunt of considerations involved in a choice between California's two great cereals, wheat and barley. Of course Dean Hunt does not definitely say which any man should undertake. No one but a positivist who can only see one side of a question (either because of his own short-sightedness or big-headedness) will ever undertake to tell another man exactly what he should do without exercise of his own judgment. Men who do that are most safely avoided. There are however other considerations than the economic and commercial factors which Dean Hunt presents. One is that a man in choosing between crops should take that which he best understands and which he knows his land, weather conditions and his equipment are best suited to handle. If he gets a good full product of that it may offset a possible deficiency in price as compared with another product of higher market value of which he may get less weight. This fact is of course involved in Dean

Hunt's suggestions; we are merely trying to emphasize it a little. It is largely on the barley side of the argument, because barley is less exacting and will make more crop with less time and water than wheat will, and if a man is sure of barley our advice to him is to get it. On the other hand, when a man knows his land and other conditions are set for wheat, let him get that. But in either case let him have a good reason for whatever he decides to do. It was one of the foolishnesses of war that farmers were specifically urged to do this or that to "win the war," and too many were thus led to lose money while the war was being won, because they were not protected and provided for when the product was ready to sell. The assurance which the producer must now seek is the best surety he can get that his crop will sell at a profit to him. We understand that future buying is now being indulged in to some extent and that contracts are being made for next harvest delivery—not "futures" but actual delivery. There are apparently some buyers who are sure enough of the future to contract now at prices which ought to yield the grower a good margin. We do not know how general or how available such contracts are, but so far as they go they may relieve some growers of risks which they may not wish to take and they may indicate to those who wish to take the chances of selling better next summer, that the buying interest is quite confident of the demand for the next crop. If then a man is equally well fixed for either wheat or barley he may get a side-light on his problem by conferring with millers and shippers on their offers for future contracts—whether he decides to take or leave them. We are aware that this is not a good academic suggestion, but it may be of considerable practical importance. The present grain outlook surely is that California may expect to get lots of it and to get also good prices for it.

HOW TO BE JOYFUL.

It seems too bad that every time conditions seem to baffle a great outbreak of Christmas celebration we should have to be chilled by proclamation of the fact that indulgence in decorative expression of such joy is undertaken only at the cost of desolation and denudation. This year, for instance, just as we are seeking some brief respite from the "red menace" by clothing ourself and our habitations in Christmas green, we are warned that Christmas trees and Christmas berries can only be had by poaching upon forest reserves, which the forest rangers are carefully watching, or upon public and private lands in other wild places whence the poacher can perhaps get away with the loot because no one is looking. But this is not a good way to get material to celebrate the birth of the Babe of Bethlehem who grew up to teach us not to poach upon what belongs to others and to render unto Caesar the things which are Caesar's. And upon this fundamental question of morals there comes an awakening of the public conscience from another point of view, viz.: that destroying trees and shrubs upon lands which are for the uses of posterity is a straight run toward future desolation and denudation of our large open areas. Therefore, it is almost impossible for any thinking person to look wholly with joy upon the beautiful greenery which is now gathered from year to year to express our holiday rejoicings and our good will toward all mankind. We have no doubt in our own mind that the old way of securing holiday greenery should be abandoned. Irrespective of ownership of the wild lands they should not be denuded, for the beauty of them in their natural condition belongs to every one who passes or crosses them; their water conservation as forested areas is a service to the whole population, because it guards the streams from overfullness or scantiness and because their natural cover keeps the idle lands in best form for settlement and culture as increasing population may require them. It is our conviction, therefore, that public sentiment should be aroused against decoration which comes through desolation and that we should get our greenery of all kinds through production planned to supply it—just as we get food, clothing, art-creations and other things which civilized mankind requires for its comfort and for the expression of its emotions and sentiments. In other words we believe that all organic materials used to express our holiday joy and good-will should be grown as

farm crops and men as a whole should no more revert to savagery to get their Christmas trees, garlands and festoons than they now turn to savagery to furnish them poultry, sucking pigs, cranberries, boiled onions and other culinary expressions of joy and good cheer!

LIFE A PROLONGED CHRISTMAS!

We are aware that these titular words would be an elegant propaganda-slogan for some sort of an emotional uplift, but we wish them to stand for something more tangible and concrete. We are thinking about a bunch of perfectly good jobs for young men of about twenty, each of whom is perfectly sure what girl he wishes to marry and each of these girls willing to sign the league covenant without reservations. Lacking either of these qualifications our scheme will not work as we intend it to, in both letter and spirit. Let each young man who is thus endowed and is able to finance the undertaking from his earnings, in addition to meeting his current cost of living, put in five acres of Christmas trees. The opportunity is of course widest open to young men whose lot is cast on the upper coast or in the Sierra Nevada, where rainfall is abundant and a little land is easy to get—a little flat or slope perhaps too small or too detached to figure in a greater enterprise, with perhaps a spring or other small source of irrigation—for safety or for pushing if affairs become critical. Gather seeds of the local conifer, which sells best for Christmas trees; grow seedlings in shallow boxes of the best local sand in a handy half-shade of tree or building where water is near for sprinkling; plant out these seedlings the following year four feet apart each way, after preparing well the ground for them; cultivate the patch about once a month at odd times during the summer. Two summers' growth from planting out will bring size enough for small trees for the following Christmas and half the crop can be harvested in December—leaving the remaining trees eight feet apart. Cultivate the ground as seems necessary to let moisture into the soil and to keep weeds or winds from robbing the standing trees of possession of it. In one or two years, according to the growth you get or the preference of the city retailers for sizes, cut part or all of the trees for shipment. As prices are now running it is possible that for half the trees you should gross 50c. each and for the other half \$1 each, and this would perhaps net you \$400 per acre for your four years' crop.

We make this calculation with some care and some regard for human nature. We prescribe for cutting half the crop at two years old, not alone to give the other trees a chance to get size and shapeliness, but to provide funds for better clothes, gasoline, movie-tickets and other courting supplies—which will be undoubtedly required to hold the honey to the terms of the league-covenant. But four years to wait for a crop, even if it does mean \$100 per year per acre from a little corner of good land, may seem a long time and four years may be long to wait for a girl, after the queen has really dealt herself to you by the covenant. We may be asked if we cannot speed up both, when the desires grow faster than the trees. We are no psychologist to prescribe for the impatience of youth, but we have a secret which may save a year in getting size on the trees. We give it not to the public but to those alone who comply with all the terms set forth above for our Christmas tree growing contest and enter thereupon—because to those alone who cherish a noble purpose in life and conscientiously strive to attain it can there ever be a really Merry Christmas; and to them it is not a joy of a day, but the prolonged joy of a lifetime! To those, therefore, who are prepared to press forward toward this attainment by way of a crop of Christmas trees, the Rural Press will reveal the secret of making the trees keep time with the heart-beats!

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

White Sweet Clover.

To the Editor: Is sweet clover a good summer feed for milk cows and will cows bloat if pastured on it when it is green? Will it grow well without

irrigation and produce lots of feed? Is it a good way to plant sweet clover seed to get right out when it is raining and let the rain beat it into the ground?—B., San Luis Obispo.

White sweet clover (*Melilotus alba*) is a nutritious forage plant. Cattle do not usually take kindly to it but eat it freely after they learn to like it, which they are apt to do quickly if they get it when other green feed is shy—otherwise, they are apt to let it grow up and eat other grasses and clovers. It is not likely to bloat—perhaps because cattle are not so apt to gorge themselves with it. The seed will catch well on firm land, but harrowing will help get a better stand unless there is constant moisture to prevent drying up of the tender seedlings soon after sprouting. The time to start the seeds is in the rainy season—the earlier the better. The duration and amount of summer growth will depend upon whether its deep roots can find moisture enough to keep it going.

Transplanting and Lawn Making.

To the Editor: I want to plant my hedge. When is the best time to do so? Also, I want to transplant some rose bushes—when should I do that? What treatment should I give my ground, which is a sandy loam, to start my lawn and when?—L. M. B., Sacramento.

We would not think of transplanting an old hedge; it is better to start again with small plants. If you mean to plant out a hedge, it is timely to do it during the next two or three months on such soil as you describe, because it will not hold too much cold water. On heavy soil it will be better to wait until February or as soon as the soil gets into good condition after the heavy rains are over. Plant out roses at the same time under the same conditions. You can dig a lot of stable manure into your lawn space now and let it lie through heavy rains. When the weeds appear rake them out and keep the surface loose. Sow the seed any time, now or later, whenever the ground is not too wet or too cold.

White Sweet or Red Clover.

To the Editor: Which is better for a peach orchard—white sweet clover, or red clover, and which is the best for feed? Is it better to inoculate the seeds?—J. T., Gridley.

Red clover is vastly better feed, but it is a summer-grower on irrigated land because it is shallow rooted and cannot stand much dry heat. For green manuring in California, sweet clover is better because usually we desire to get the growth with surplus water from rainfall, and red clover will not grow much in the winter. For green manuring, without regard to feeding off, yellow sweet clover is better than white, because the plant is hardier and the seed is cheaper, but if you wish to teach your stock to eat it you had better take the white. Inoculation is desirable if your land does not naturally grow any bur or other wild clover, or has never grown beans or peas. If it has, inoculation is unnecessary.

Common Fruit Tree Borers.

To the Editor: When do we look for borers, and what is the procedure against them?—S. A. M., Merced.

The common flat-headed borers generally go into trees with bark burned by the sun. The preventive is to whitewash the bark in the fall or early winter wherever the sun can reach it and a few inches below the surface where the hot soil may burn the bark. It will not do to wait until the rains are over because the bark is apt to burn with the winter sun before the leaves appear. If borers get in in spite of preventives, there will be dark spots on the bark in midsummer and the borers must be cut out by opening up such spots as soon as seen before August or September, so that the borers will not be working all the fall and winter until they emerge as beetles in the spring and lay eggs for another generation of borers.

For a Smutty, Anty Orange.

To the Editor: Can you tell us what we can use as a spray for blight on an orange tree, and also how we may keep the ants off the same?—T. M., Cupertino.

Your orange tree is infested with scale insects. The ants are going after their excretions and the blight or smut grows on what the ants do not get. The treatment is to kill the scale and that can be done by spraying with distillate or kerosene emulsion so as to reach all the twigs on which the scales are sitting. On commercial orchards in the citrus district this is done by fumigation with hydrocyanic

acid, which requires skill and quite an outfit. A few trees can be kept reasonably clean of scales by spraying from time to time as the ants and smut show you that the scales are busy.

Vines in 4-Year-Old Orchard.

To the Editor: My four-year-old prune trees are 24 feet apart one way by 20 the other. They are on strong, heavy, white ash soil, and the trees are very thrifty. Would it be all right to plant one row of Thompsons between the rows? I have a pumping plant and can water when necessary.—E. C., Kingsburg.

The land and water are all right for it, but with such growing conditions, your trees are too near together already and the vines are not likely to give you anything but interference and bother. It is too late to put in vines. If you had planted them both that way four years ago the vines might have helped you and it would now be time to be taking them out.

Winter Grown Silage.

To the Editor: Please advise me what kind of a winter silage crop barley or vetch or oats and vetch would make. Also how many lbs of each would you sow to the acre?—H. S., Modesto.

They are all silageable if cut-in short, spread and tramped well when the grain is in the soft dough, or "between milk and dough"—about as for hay-making. Heavy tramping is desirable with hollow-stemmed plants, which may otherwise carry too much air into the mass. Sow about 100 lbs. to the acre—one-third vetch and two-thirds grain.

No Preliminary Spray for Pear Blight.

To the Editor: Is it well to spray for pear blight before it has been found on one's trees? And with what?—M. A. T., Herald.

There is no preventive spray for pear blight nor any curative spray either. It requires surgery. It is not a thing to worry about, but to everlastingly watch, and when you see a fruiting twig which looks as though hit by fire, send a specimen to the Experiment Station at Berkeley and ask to be informed if you have the real thing and how to go to work cutting it out.

CALIFORNIA WEATHER RECORD

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending December 15, 1919.

A Plain Talk on Pruning the Vine

Written for Pacific Rural Press by D. J. Whitney.

THIS is not supposed to be a systematic description of the way to prune grape vines, but just the report of a few important points on the subject gathered from a talk by A. E. Way, viticulturist of the Kearney ranch experimental vineyard, before a meeting of the Exeter farm bureau—and the discussion following.

The first thing is to get a straight, clean, strong stem, whatever variety of vine is grown, and for this reason each vine, no matter what variety, should be staked at the start. If the first summer's growth is sufficient to provide a straight, strong cane that will be as thick as a lead pencil at 21 inches above the ground, a stake can be put in and the cane tied straight to it, and topped at the right height. If not, cut back to a couple of buds and wait another season.

These stakes as a rule can be short, if the right system of permanent pruning is to be used. A Muscat stake can be three feet long, 15 inches in the ground and 21 inches above. This stake is only temporary so any kind of wood can be used. Most people do not stake Muscats, but staking gives such a straight, clean stem that it more than pays.

Keep Stems Clean.

Whatever the variety, keep the stems clean of suckers. It used to be thought wise to remove all shoots from the lower stem the first season after the vine is staked.* Now it is believed best to just pinch back these temporary shoots very closely the first season, for that will give a thicker, sturdier stem. Then the following winter they can be cut off close.

Every year after that keep the shoots off the stem whenever they show up even if it takes six suckers a season, and in a couple of years you will have no more suckers and the vine will be clean and strong. Otherwise suckers may develop every year, and whenever they get a good start they will rob the vine of sap that is needed for fruit and for good canes. If the first summer's growth in the vineyard will give a cane that will make a stem for the plant, it can be used. Otherwise, and this is the rule, cut back to leave two good buds near the ground and make a head from the best of the resulting canes the following winter. Unless about half of the vines can be staked the first winter it probably will not pay to stake any of them, but cut them all back and give them all an even start.

Keep Down the Head.

With every variety, and whatever system of pruning is used, keep the head from getting higher than it is supposed to be. To do this always have the renewal spurs below the regular fruiting canes. Always also have more renewal spurs than fruiting canes. For instance, if there is four fruiting canes, have six or seven renewal spurs. As long as these spurs are below the canes the head cannot get high.

This whole proposition of the height of the head is very interesting and very important. In Thompsons grown on wires occasionally a grower will have a head at the top wire as well as the lower wire, or canes coming at each wire. He will possibly get very heavy crops for two or three years and think he is doing great, but in the first place he will weaken his vines by too heavy production, and in the second place, before long the top head will weaken the lower head until it is no good, and so he will have only one head after all and that at the top wire, where it should not be. The permanent head ought always to be at the lower wire. If a man has a double-headed vine, he can cut off the top head, provided the lower group of spurs is strong enough, and get along all right. If the lower spurs are too weak, they will gain plenty strength after the top head is cut off, but a year's crop will likely be lost.

Lowering High Heads.

Many old Thompson vineyards grown on the stake system are headed far too high. Try this plan of making a lower head. Bend the canes downward, loop shape. This will force sucker buds out on the trunk, and it will also make the bended canes set fruit heavily, so it will be a profitable

thing for its own sake. Rub off all the sucker shoots on the old trunk, except those at the height you want the new head, and in the next winter's pruning you may have a strong enough growth from them to make it possible to remove the old top and have a new head at the right height. In order to get these new shoots, though, it is necessary to bend over the fruiting canes. This plan works well with the Thompson.

Pruning Staked Thompsons.

A common practice in pruning staked Thompsons is to tie the fruiting canes upright on the stakes. Far preferable is the plan of looping the ends over so that the middle of the canes are the highest parts, making the ends point downwards or sideways. This bending over makes fruit wood and results in a very great increase in yield. This is positive and certain. However, the right way to prune Thompsons is on wires. The head should come at the first wire and the canes be tied along it, and the upper wire should serve strictly for the summer growth from the canes to climb upon.

Also, in tying the fruit canes in the winter pruning, do not tie them straight out, but loop them a little, twisting the end under the wire, which will make the laterals come out more evenly along the canes than when the canes are tied straight and level. There is no question about the benefits of this plan either.

Cordon System Seems Best.

The almost universal system of growing Emperors and Malagas is to have tall trunks and long canes. An emphatic recommendation of the cordon system for new vineyards is given with these two varieties, and also with the Ohanez, or Almeria, which is the leading Spanish grape shipped to the United States in winter. A detailed description of this system is required for a good understanding of it. The essential feature is to train the trunk something in the shape of an "L," with the short arm stuck in the ground and the long arm running along a wire parallel to the ground. Then the canes come out all along this arm, which usually is 4½ to 6 feet long. The upright part of the trunk is kept perfectly clean of suckers. The permanent branch, resting along the wire, is trained about six inches higher than the lower wire on a good Thompson vineyard. A second and higher wire runs along to hold up the canes that come from the spurs along the head of the vine.

In starting this permanent arm, a cane of the young vine is bent along the wire, trimmed to the required length and looped a little and the head tied under the wire. The tendency will be for the new shoots to come at the end and beginning of this cane, so these shoots are pinched back strongly, which will force other buds out evenly all along the top of the cane at the nodes. These shoots will later provide spurs for the canes to start from every year. They should be about 8 inches apart. Places for about 8 fruit canes should develop from a permanent top of 4½ or 5 feet long.

This system of pruning for the varieties named has proved a big success on the Kearney experimental vineyard. Five-year-old Malagas pruned on this system have run 10½ tons to the acre.

Saving for the short temporary stake at each vine, needed to get a clean, straight stem started, wires are what supports these vines and not many stakes are required. A good, strong, well-anchored post at each end of the row is the main thing, and strong posts for every three vines are about right. Likewise with Thompsons, it is better to make the wires support the vines and have occasional posts half-way between vines support the wires than to have a permanent stake at every vine.

Over-strong Vines.

If a vine is weak, it can be pruned very short to force vigor into it. Good cultivation, and abundant early irrigation, keeping the water on the ground until the soil is well filled with it, stimulates growth and vigor also. The other side of that rule will not work for overly vigorous vines, according to Mr. Way. That is, although vigorous vines fruit better when they are pruned long and have plenty

canes, an extremely vigorous vine (or vineyard), say on rich, strong soil, will only grow more vigorously than ever if more spurs are left than usual and more canes forced out. The only satisfactory way to make it substitute fruit for extra vigorous growth, is to handle it from the soil side, not from the pruning side. Plow rather late and hold off the irrigation water longer than usual in the spring; in brief, give it a little less favorable growing conditions and it will make more fruit than it will if it is permitted to grow as fast and strong as possible.

GOLDEN OPPORTUNITY FOR CHERRY GROWERS.

(Written for Pacific Rural Press by R. E. Hodges.)

What seems to be an ideal situation for the cherry growers of Santa Clara Valley was proposed at a mass meeting in San Jose December 11. The point was made that while many growers who shipped their cherries East last year received in return large quantities of red ink, and while growers who sold to the commercial canneries received about six cents per pound, and while growers who sold their fruit on the trees received three or four cents a pound, those who sold to the California Co-operative Canneries received eight cents per pound on delivery, and later co-operative dividends increased this price to twelve or twelve and a half cents.

Co-operative Cherry Shipping.

This is not all. Manager J. L. Nagle of the California Fruit Exchange offered Santa Clara growers the use of this long-established co-operative organization to ship their cherries East and get cash returns. He pointed out that the Exchange includes about 3,000 growers of deciduous fresh-shipping fruits who shipped 5,053 carloads of California fruit out of the State this season. These growers are organized into 40 local associations, operating 65 packing houses. Their fruit was during the past season sold in 256 markets, and they have regular representatives in the great auctions of eleven large cities in the U. S. Their marketing facilities are well-nigh perfect, being an affiliation with the California Fruit Growers' Exchange, whose citrus activities are least while the deciduous fruits are being shipped in largest quantities. Red ink on Santa Clara cherries was shown to be largely due to faulty individual grading, packing, and shipping, which would be standardized under Exchange auspices.

Ship What You Can and Can What You Can't.

The suggestion worked out at the cherry growers' meeting was that the cherry growers should organize definitely to send their shipping cherries East through the California Fruit Exchange and to affiliate with the California Co-operative Canneries to handle the rest. J. F. McCauley and Albert Haentze, representing the Canneries offered use of their facilities to the cherry growers to pack their shipping cherries and put the rest into cans all at the same plant and all co-operatively. The Exchange reserves seven per cent of gross selling prices until operating costs are paid; and distributes all except operating costs to its members. The operating costs last year were less than three per cent of gross selling prices, an efficiency characterized at the meeting as excellent almost, if not quite, all other shipping enterprises. The Canneries' voting trust agreement provides that all proceeds from sale of products shall be distributed to members after the expense of canning and marketing and not to exceed 8 per cent interest on the capital invested in the cannery have been paid.

Investigating Committee Appointed.

A growers' committee was appointed to investigate in detail the desirability of such an arrangement. This committee consists of H. G. Stelling, J. G. Ridley, R. S. Streeter, E. K. Johnson, R. M. Butcher, F. C. Willson, J. D. Joseph, and Herbert Pash. They were given access to the records and plants of both the Canneries and the Exchange, and will probably have a report ready very-soon.

The Co-operative Canneries and Armour

Written for Pacific Rural Press by R. E. Hodges.

IS THE California Co-operative Canneries co-operative in fact or is it controlled by Armour & Company? That is the question in the minds of many growers; and it should be answered satisfactorily before growers invest in the capital stock the Canneries are about to sell, and before growers tie up their crops with the concern.

The Pacific Rural Press is jealous of the word "co-operation." We will fight against the use of that word in any project which pretends to be a growers' organization, but which is controlled by parties interested in exploiting the growers and increasing the profits taken out between producer and consumer.

When we see a great deal of smoke, we may be pardoned for investigating to see if there is a fire before we cry out that "All's well." This lays us open to the charge of suspecting and injuring co-operation; but it is really the only course that can benefit true co-operation when attacks are being made on it under a smoke barrage.

We hold that co-operation can succeed only as democratic government can succeed—by making its benefits felt by people enough to enlist their active support, and by keeping the people fully informed as to what is going on. Ignorance breeds distrust, and distrust disrupts. No project has a right to ask support from growers as a co-operative concern unless it is willing to keep the growers informed regarding its accomplishments and methods. This is why we were greatly pleased on a recent occasion when the manager of the California Co-operative Canneries told us point blank that we were at liberty to inspect anything that concerned their outfit, its accomplishments, and methods of operation.

Until that occasion, we had been at loss to form any sort of judgment in this case where it seemed that two or more sets of supposed co-operators were claiming that the others were not co-operators at all.

It is claimed that the California Co-operative Canneries is an Armour institution, intended to work Armour into control of our ranchers' fruit crops for a period of ten years at prices determined not by the growers, but by the California Packing Corporation, whose interests are the opposite from those of a real growers' co-operative cannery.

It is charged that the Co-operative Canneries have a contract with Armour covering those points, that Armour loaned them \$250,000 to help build their plant at San Jose and took a mortgage on the plant; that Armour has advanced money to make first payments to growers on delivery of fruits at the cannery, and that Armour's engineer supervised construction of the San Jose plant. They also point to what seems to have been treachery of officers in the Co-operative Canneries when the attempted deal was recently exposed whereby two of the directors came near accomplishing the sale of the plant and contract to a San Jose canning concern with the understanding that these directors would get a rake-off on all the fruit sold through Armour, for the next ten years. This attempt failed. It never was countenanced by the management or stockholders, or creditors. Opponents also charged that Armour until recently had acted as a chief distributor for the California Fruit Canners' Association, and later for the California Packing Corporation; but when the latter company recently decided to do their own distributing, Armour had to seek other fruits. This he did by attempting to organize growers' so-called co-operative canneries, handling their fruit at a five per cent discount, rather than the ten per cent discount they had been receiving from the Packing Corporation. They claim that the Packing Corporation got wise quickly, and offered them the ten per cent discount again.

These charges really look shady if you look at them alone; and uninformed growers could well withhold support until they could see the other side. The Pacific Rural Press has seen a great deal of the inside of the other side recently.

We have seen the Armour contract, and the

financial statement of assets and liabilities of the California Co-operative Canneries as presented December 11 to the California Corporation Commissioner. We have read their by-laws and voting trust agreement. We state facts and conclusions below as they appear to us.

Co-operative Canneries to Sell Stock.

It was last Spring that the California Corporation Commissioner gave the California Co-operative Canneries permission to sell \$200,000 of their authorized \$500,000 capital stock, knowing the existence and nature of the Armour contract. They sold part of this, but got busy on the canning which became an emergency measure to save apricots, peaches, cherries, and tomatoes, particularly, as will be related later. Recently the same parties who attempted to sell the plant without the consent of General Manager Vernon Campbell, or the growers, went before the Corporation Commissioner with a list of charges which led him to hold up temporarily the permission to sell the rest of that \$200,000. This was just at the beginning of an active campaign for sale of that stock. The Corporation Commissioner investigated, and has given permission to sell not only the rest of the \$200,000, but \$200,000 additional. Of this amount \$150,000 will be used to build a cannery at Visalia. The other \$250,000, or so much as may be necessary, will be used to complete the big plant at San Jose and provide working capital for next season's operations.

The Armour Mortgage.

The Armour mortgage is not to be paid off until due, as its terms are much more favorable than could be obtained from banks. It runs for ten years, and none of the principal on it is to be paid during the first two years. Armour cannot bring any pressure on the Canneries on the basis of the mortgage. Provision is made in the Voting Trust Agreement for five per cent or less of gross returns on all products sold to be paid to growers in the form of stock in the Canneries, and cash thus received is to be used in repaying the Armour and other loans, and in factory operations and permanent improvements. This will automatically pay the mortgage if the Canneries operate on anything like the scale of their 1919 operations.

The Armour Contract.

The Armour contract is considered the most valuable asset of the Canneries. Mr. Campbell has been before our readers more or less for several years. It was an article in the Pacific Rural Press giving his figures on the costs and great profits of canning, which led to the organization of several co-operative canneries in the San Joaquin Valley and Southern California some years ago. While some of these canneries achieved success others failed through lack of a market for their output to meet the competition of the established commercial canners. Mr. Campbell learned through his seven years' efforts along this line in this State, that a sure market must precede successful co-operative canning. So last May he made this contract with Armour who sells direct to retailers. Armour agrees to buy all of his requirements of canned goods from the California Co-operative Canneries as far as said Canneries are able to supply said requirements, at prices based on the announced California Packing Corporation prices. It was realized that no fixed price would do for a term of years. Many growers are today selling at half price under long-term fixed-price contracts. The only way to fix the price in the Armour contract seemed to be on the basis of the one outfit whose prices are considered basic by the entire trade. This involves higher or lower prices as each year's crops and demands justify. But if these prices do not provide a fair price for the fruit the Canneries may withhold delivery. The amount of each kind of fruit and vegetable needed by Armour is to be specified early in each year. This contract probably involves more fruit than any contract ever made before and its value to the growers can readily be seen. Because of the enormous amount involved, and the difficulty of financing such huge operations soon enough for the last crop, Mr.

Armour was told it would be necessary for him to furnish the money on the terms discussed above. Of course, with so much money risked, Armour would naturally have his engineer see that the plant was properly constructed to make money to repay the loan.

Assets and Liabilities.

The financial statement shows assets and liabilities amounting to more than a million dollars each. Fixed assets including the factory, etc., amount to more than half a million. This estimate is at least twenty per cent under the present value of the plant, according to the contractors who built it. They claim on the basis of their experience building a score or more of canneries, that the Co-operative factory is arranged for the most economical handling of fruit. Current assets readily convertible into money amount to more than \$600,000, but this includes a lot of canned tomatoes which they do not expect to sell until prospective better markets and better car situation materialize in the first half of 1920. The Armour contract provides that he must pay on December 31 for all canned fruit in the Co-operative warehouse. The liabilities represent among other things the Armour mortgage and a loan of cash, which was paid to growers on delivery of their fruit. They also include a little less than \$100,000 of capital stock already issued. Owners of this stock are liable for the present liabilities; but growers who buy stock hereafter are not subject to those liabilities under the law.

This is a remarkable case of doing a big vital legitimate business on a very small capitalization. It is possible only by the liberal terms of the Armour loans. Those loans constitute a claim against the plant and its products, until they are paid off; but they represent no other control. Nevertheless, it is sound finance to have as few creditors as possible, and the current assets will be used as promptly as possible to pay the liabilities. Armour owns no stock, and he could not vote it if he did, because all stock is tied up in a trust agreement similar to those of the California Associated Raisin Company, the California Peach Growers, Inc., and the California Prune and Apricot Growers, Inc.

In view of these facts it would appear to be of vital importance to the success of the Co-operative Canneries movement that this issue of stock be promptly taken up by the fruit growers of the Santa Clara Valley and the Visalia District and the valuable properties which have been created, including the Armour contract itself, be maintained in the interests solely of the growers of California.

PEAR ASSOCIATION FRUIT TO CANNERIES.

Of the 110,000 ton pear crop produced in California in 1919, about 30,000 tons were canned. About 14,000 tons of the cannery pears were handled by the California Pear Growers' Association for its 450 members, according to President-Manager Frank T. Swett. These were sold at \$85 per ton. From that \$85, 90 cents per ton was deducted by the Association to cover its costs of operation, inspection of the pears, shipment to the canneries, collection from the canneries and distribution of money to the growers, and the payment of insurance against failure of canneries to make payment in full. No losses were encountered.

"Why don't you handle pears for Eastern shipment?" Mr. Swett was asked.

"Because there is already the efficient California Fruit Exchange which ships pears to the East co-operatively. It would be a useless duplication of effort for us to ship, and it would weaken co-operative marketing," was his answer.

"Why do you not handle dried pears?"

"Because only 5,000 or 6,000 tons of dried pears are produced annually, and even if we could control the whole crop, the overhead might make co-operative marketing too expensive to hold the growers. But a large proportion of the dried pears are grown for a big packing concern on long-term contracts which would prevent our getting firm control at present.

HORTICULTURAL JOTTINGS.

A large acreage will be set out to grapes this season in the Imperial Valley.

Selection by the California Land Settlement Board of a tract of land in Merced county for colonization pur-

poses has been announced by Prof. Elwood Mead, chairman of the Board. The tract comprises 8,000 acres and was purchased from Edward M. Wilson of San Francisco for \$92.50 an acre. The settlement will be devoted exclusively to ex-service men. There will be room for 300 families and

1,000 applications already are on hand for allotments on the settlement.

The late cold wave and rain did little damage in the Corning citrus fruit crop section.

The Fresno Chamber of Commerce announced that "Black Raisins" are in heavy demand and that 17c is the price quoted.

The peach harvest of Yuba City for the year 1919 is more than \$2,000,000 in value, it is said by farm adviser C. E. Sullivan of Sutter county.

Libby, McNeill & Libby are to locate another large cannery in the Sacramento Valley. It will be a \$335,000 structure on a 13-acre site in Gridley.

A lemon growers' excursion has been organized by the lemon growers in the Oroville District and they recently visited the Mills Orchard at Maxwell in Colusa county.

Orders for workers in the rural district through the State free employment bureaus have been brisker since the rain, as this has enabled work to be started in the orchards.

Announcement is received from Valparaiso (Chile) of an advance in prices, of nitrate to ten shillings, six pence per ton, owing to the increase in wages recently granted, and to higher railroad rates. It is estimated that 500,000 tons will be sold and shipped this season.

A new ruling has been announced by Commissioner Collins of Tulare county in which he classes all split oranges as "seriously damaged" within the meaning of the standardization law and has instructed all inspectors to prevent their sale for food.

C. E. Campbell, manager of the Stewart Fruit company's packing interests, says that "incompetent" and "impractical" methods of shipping, enforced during the grape season by the United States railroad administration, caused an aggregate loss of over \$5,000,000 to the vineyard men of Tulare and Fresno counties.

W. M. Giffen, president of the California Associated Raisin Company, testified before the Federal Trade Commission recently that out of 10,000 growers and 123,000,000 consumers of Associated raisins, there was "not one appearing here against us." The packer complainants, he said, did not have the interest of the public at heart.

The Rubyhill Vineyard Company, Pleasanton, has completed its wine shipments to the California Wine Association. Wines valued at more than \$100,000 were shipped from there. The wine is to be exported to Europe, as is allowed by the Government, in an effort to assist the wine makers in getting rid of their rare vintages.

Placer county fruit growers were last week promised water by General Manager John A. Britton of the Pacific Gas and Electric Company. The complaint has been that the large acreage between Auburn and Colfax was lying undeveloped for the reason that the P. G. and E. Company, which owns the irrigation system for Placer county lands, could not and would not guarantee any more water. Britton gave them the assurance that all those now planted and within the next three years would be cared for.

Word comes from Porterville that some investors from the northern part of the State, and especially from the raisin district, who recently invested in Poplar district land with the intention of planting raisins on a large scale, are understood to have placed their property on the market again. Their action is said to have been taken after they learned the unanimous and

determined sentiment in this section—one of the few where Japanese have never been allowed—against the employment of Oriental labor.

Legal transfer was made last week to the California Prune and Apricot Growers' Association of property for the site of the proposed new packing plant for the corporation.

Twelve hundred Eastern black walnut trees have been received in Woodland to be transplanted and prepared for planting along Yolo county's new \$1,000,000 highway. It is estimated that it will cost about \$125 per mile to plant and maintain the trees the first year, but they will be self-supporting after 1921. The trees will be grafted with the English walnut.

Canneries at Hemet are working full capacity on the olive crop. The Cooperage Cannery expects to handle considerably more than their output last year, which was 120 tons. The Golden State cannery expects to handle 200 tons before the season is over. Prices are much higher than last year, ranging from \$70 per ton for oil olives to \$350 per ton for the jumbo grades.

Supervisor F. L. Roehr of Butte county has secured from the Bidwell Park Commission a ten-year lease on a three-acre tract west of the Hooker Oak tract. The consideration for the lease is that Roehr will plant the ground to prune trees and return the same to the Park Commissioner at the end of the tenth year. The commission will thus secure a developed orchard in ten years, and Roehr will receive about three crops for his efforts.

According to figures just made public by agents of the Southern Pacific, Tidewater Southern and Santa Fe railroads, 3,214 carloads of cantaloupes were shipped out of Tulare during the past summer. These figures do not include large quantities of the fruit shipped out in small lots by express. Reports made by the Turlock Merchants and Growers, the Turlock irrigation district's biggest shippers, show that growers shipping through them received an average of \$1.17 for each standard crate shipped.

There will be a greatly increased demand for all kinds of berry juices during the next few years, according to Fred Seiberger, county horticultural commissioner of Alameda. He says that orchardists who are putting out young fruit trees can make their land do double duty by planting berries in the center of the rows on a single trellis. In this way, he points out, a good crop of berries can be harvested each year until such time as the trees get too large.

TOP DRESSING TALKS, NO. 3 DOES IT PAY TO TOP DRESS GRAIN?

"Considering the state as a whole, it (the College of Agriculture) feels reasonably safe in saying that by the use of 100 pounds of Sulphate of Ammonia*** an increase can be made of 6 bushels of wheat or 10 bushels of barley per acre, provided it is applied to land adapted through climatic and soil conditions to the crop in question." (Professor Thomas Forsyth Hunt in California Circular No. 169.)

ARCADIAN Sulphate of Ammonia

Arcadian Sulphate of Ammonia is the safest and most economical carrier of nitrogen for California soils. In addition to supplying quickly available nitrogen in a non-leaching form it supplies an abundance of sulphur, a plant food element often lacking in California soils. It is "The Great American Ammoniate."

Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past.

Arcadian is the kiln-dried and screened grade, made fine and dry for top dressing purposes. Ammonia 25 1/4% guaranteed. Made in U. S. A.

"I save two to two and one-half hours daily on a 22-mile milk route with Goodyear Cord Pneumatic Truck Tires and find milk travels in better condition than in my solid-tired truck. Three teams would be required to do the same work done by the pneumatic-tired truck."—Frank Leibel, Farmer, Newbrighton, Minnesota

MANY farmers, like the one quoted above, know that a pneumatic-tired truck saves much time, drudgery and expense.

They know that this is a very valuable saving in these days of high labor costs and when markets must be reached more promptly than ever.

For pneumatic tires free a motor truck from the handicaps imposed by solid tires; they give it utmost traction and cushioning for all-round utility.

Rural users of Goodyear Cord Pneumatic Truck Tires load in the fields, reduce market hauls by hours and get

top prices for perishables and livestock, sometimes injured by slower, harder transport.

By helping other power-driven farm machinery to work to capacity, Goodyear-Cord-equipped trucks enable farmers to secure the full benefit of motorization.

While pioneering the development of pneumatic truck tires Goodyear has widely investigated the benefits secured by farmers employing them as above.

Consequently, further information concerning the use of pneumatic-tired trucks on farms may be obtained from The Goodyear Tire & Rubber Company, at Akron, Ohio.

GOODYEAR

The **BLASTER** says—
*"I use **GIANT**
 It gets them out
 cleaner"*

Professional blasters know explosives. They have tried all the different makes. Many of them say "Giant gets the stumps out cleaner." John Zurr of Santa Rosa, Cal., writes:

"From the beginning of the time I have been using powder for stump blasting and other agricultural work, I have found the powder made by The Giant Powder Co. to be the most satisfactory. Each certain percentage of Giant Powder is exactly what it is represented to be."

Tell your dealer you want the genuine Giant Farm Powders—Giant Stumping or Eureka Stumping. The Giant trademark on every box is your sure protection against imitations.

It will pay you to write today for our book, "Better Farming with Giant Farm Powders." It tells scores of money-saving ways of doing farm jobs—land clearing, ditching, tree planting, etc.

Oranges Yield \$500 per Acre

(Written for Pacific Rural Press by D. J. Whitney.)

A person growing oranges, or about to grow oranges, naturally desires to know what is the best way to attend to various details of orchard culture. Conditions differ, and what will be best on one place may not be best on another, but the practice on the best groves is a good practice to look into.

From the H. P. Taylor grove of slightly more than four acres, almost adjoining the town of Exeter, being only a part of a 20-acre ranch, there has been harvested consistently during the last four years almost the largest crop per acre of the whole district. However, in addition to mere yield the quality has been superb, almost unsurpassed.

Splits and other serious defects make the cull pile large at almost every packing house. From this orchard the culls run from six to seven boxes a year, or as near nothing at all as can be imagined. Considering the heavy loss from splits and overgrown oranges in most places, this fact is significant.

That is not all. Mr. Taylor's proportion of fancy to second grade fruit, which latter includes good merchantable fruit, thrip marked or rubbed by adjoining twigs, runs about 7 or 8 to 1. (Ordinary packing house run may be only 50 or 60 per cent fancy.)

During the past four years the proportion of fancy to second grade fruit has been 5% to 1; 6% to 1; 7% to 1, and 8 to 1. As the trees grow older it can be seen that the quality improves. The grove will be 13 years old next spring.

The yield for the last four years has run approximately 1000 boxes from the 445 trees; last year the crop was lighter than usual with 812 boxes of good fruit and only 3 boxes culls. Packing house returns have averaged \$500 per acre for the four years.

Conditions that bring about this result are worth noticing. The soil is a rich, deep, uniform chocolate loam. Some one has said that in every case he investigated of great success in fruit growing he found the trees growing on naturally very rich soil. There is a good deal of truth in it.

In this orchard, 25 pounds per tree of commercial fertilizer are applied every year. To supply organic matter,

or humus, natural cover crop is permitted to grow as rank as it will and is allowed to get three-fourths ripe before being turned under.

Disking but No Plowing.

This work is done with a disk. No plow has been used in the orchard for a number of years. First a harrow is driven over the orchard north and south to flatten out the vegetation; then a disk is driven east and west to get the stems square on the side to cut them up. This is followed by cross disking, then diagonal disking until the former cover crop is cut up so fine that it is quickly incorporated in the soil. The fine condition it is chopped into makes it rot far quicker than whole stems which had been turned under bodily by the plow possibly could decay. Mature cover crop is far more benefit to the soil than soft, green stuff, and there is not the check to the orange roots that early plowing would give. The best judgment of the district is getting to be that late spring working of an orange grove is best.

This disking is always put off until late in the morning, giving the straw a chance to dry out. Moist litter will only bend when the disk runs over it. If it is dry and crisp the disk will cut it.

The condition of the grove can be partly attributed to cover crop and tillage. Doubtless irrigation has a great deal to do with it. Usually about nine irrigations are given per season, against an average on most groves of about five. There can be no question in the mind of the writer but what too long periods between irrigations has much to do with causing splitting of fruit, and the practical absence of culls on this place is doubtless due to the trees never getting dry. Always when the furrows are run through, moist soil will be turned up. As to cultivation between irrigations, not a great deal is done, only enough to keep a nice mulch.

Rich soil, fertilization, a heavy mature cover crop, disking and not plowing, with frequent irrigation, seems without doubt to be responsible for consistent heavy production and almost unrivaled quality.

Caterpillars from Intercrop

(Written for Pacific Rural Press.)

People starting a young orchard frequently want to grow catch crops between the trees while they are getting a start. The proposition is all right if the right crops are grown, but there are disadvantages many times to the system. The owner of a nice young plum orchard in the San Joaquin valley planted barley for hay between his trees and sold \$2500 worth of hay as a result. Now, barley, as a money crop is not a very good thing in an orchard, though \$2500 will justify some delay in getting tree growth. However, as a direct result, it seems, of that barley crop, severe injury from caterpillars occurred the next season.

After the barley was off, the ground was too hard and dry to work as deeply, with available tools and power as it should be, unless it was first flooded and there was not enough

water for that, so it was disked, furrowed out, irrigated and cultivated in a way that kept the trees growing nicely.

This shallow working and hard ground seemed to provide a good place for the caterpillars to winter over, as they could not do if the ground was worked deeply, and next summer the caterpillar injury was far worse than it had been before or has been since. The blame is put on the barley crop, for the way it left the soil.

Summer cover crops like beans have done well and have not hurt the trees. Beans did worse in the plum orchard than in other orchards as the plums had red spider on them that spread to the beans and hurt them. This rancher advocates beans only between trees that the spider does not live on.

A MISTAKEN EMPEROR POLICY.

(Written for Pacific Rural Press.)

This fall, as in other falls, a number of Emperor growers cut off a number of leaves and soft shoots to let the sun and air in on to the bunches, upon the theory that it would hurry up the ripening. Then the weather played a joke upon them for the frost came, got in easily to those exposed bunches and spoiled them. In other words, they tried to hurry and get ahead of the frost by opening up the vines, and that very opening of the vines allowed the frost to spoil the fruit when it would have had a good chance to escape frost injury if

a lot of leaves had been sheltering it. The theory worked backward; the cutting did just what it was not supposed to do.

According to the best vineyard authorities it is hard to hurry ripening by letting in air and sunshine anyway. Weather and natural conditions, including irrigation, seem to control. Furthermore, it is positively and without question an injury to a grape vine to remove leaves and growing canes. Leaves gather and digest the food needed by a vine. To remove them at any time robs and injures the plant. The only kind of summer pruning permissible is to pull off suckers and to pinch back those shoots whose growth needs to be checked.

Why the Wallis Endures

THE most important thing you can buy in a tractor is long life. A tractor must *stand up* to be a profitable investment. Only by serving faithfully year after year can it prove a definite economy.

In the Wallis—America's Foremost Tractor—durability is an established fact. Over 12 years of experience has proved that the Wallis principle of combining power, light weight, simplicity and durability is the one outstanding tractor achievement of the day.

In this remarkable tractor many original ideas have been proven. We now know that heavy weight and bulk are not essential to great power and long life! That tractor efficiency and long life depend largely upon the quality and finishing of the vital wearing parts—the gears—the bearings—the transmission—the combustion chambers, etc.

Wallis has *proved* that the gruelling strains a tractor must withstand demands even finer materials, finer workmanship and more accurate machining than a motor car.

In the Wallis the finest materials only are used. The most expert workmanship is employed. Machining is carried to the thousandth part of an inch. Innumerable inspections eliminate inaccuracy.

In the Wallis Valve-in-Head Motor the combustion chambers are completely machined; Wallis gears are cut and hardened steel. All gears and working parts are enclosed in a dust-proof housing and run in a constant bath of clean oil. Bearings are all oversize.

And these are some of the reasons why Wallis service is constant—why owners have utmost faith in its performance—its dependability—economy and long life.

Naturally Wallis durability, combined with its tremendous power, light weight and simplified construction, results in a new standard of economy. Everywhere the Wallis has established remarkable records in "low-cost-per-acre"—and in "low-cost-per-year-of-service." These are the true tests of tractor economy.

If you are tractor buying, the Wallis deserves your interest. Not alone because it is America's Foremost Tractor but chiefly because it offers you *power, durability and economy*, which are the factors absolutely essential to a profitable tractor investment.

The demand for Wallis Tractors is naturally great. Our capacity is taxed. It is not too early *now* to order for Spring delivery. See the Wallis dealer or write us for literature without delay.

Preparing for Wheat Planting

(Written for Pacific Rural Press by Geo. R. McLeod, Sperry Flour Co.)

As we have indicated in a previous Bulletin, the problem of growing wheat in California, is not so much one of soil fertility, as it is of soil preparation.

There are several factors that influence wheat yields. Among them:

Plant Food Must Be Available.

Probably the most successful California method of rendering the insoluble ingredients of the soil available for wheat, is by summer fallowing.

The land should be plowed in the fall after the first rains, and allowed to stand rough through the winter. In the Spring it should again be plowed and also harrowed to make a covering to retain the moisture.

If in the following fall there are early rains, it is best to allow the weed seeds, etc., to germinate and get a good start, and then plow these under and seed before November 15th, if possible. If no early rains come, then the seed should be drilled in the dry ground so that it will be ready to germinate, when the rains do come, and thus have a chance to get ahead of the weeds.

Soil Must Be Finely Divided.

The principles of dry farming are very applicable to California wheat production. The conservation of moisture by so plowing the soil that it will hold the moisture and by so harrowing, and sometimes mulching the top dirt, that the moisture will be retained, is of vital importance.

Plowing loosens up the soil so that it becomes like a sponge, and retains great quantities of water. Then, by forming a blanket or covering of finely pulverized dirt, over this reservoir, sufficient moisture is retained to assure plant growth during the months of April and May, which are so often without rainfall.

Certain clay soils have a tendency to form hard top crusts when this blanket is too finely divided. Especially is this true when the winter rains are very heavy. In such cases it is necessary to harrow the land, in the early spring, and even if some of the wheat plants, three or four inches high, are destroyed, the remainder of the plants are so much benefited that the yield is very materially increased.

The Plow Sole Must Be Broken Up.

On many farms, the plow sole, formed by plowing at the same depth for several years, becomes such an established condition that one does not realize the damage it does to his land. Practically all the plant food and moisture that the grain receives must be obtained from the soil above this pan—neither the plant roots nor water will readily penetrate it.

The proper procedure is to break this plow sole up so that a larger reservoir of moisture can be formed, and more plant food become available.

This has been successfully done with a Killefer cultivator, which is made up of a number of chisel-shaped teeth set at an angle of forty-five degrees and which can be run at any depth desired.

By this means the pan is broken up, without being brought to the top, where it would interfere with the formation of a covering that would effectively hold the moisture.

Drainage.

Too little attention is given the subject of drainage in California. Large open ditches should be provided to quickly relieve flood conditions. The repeated flooding of any wheat lands means the loss of that much wheat. Drain tile are almost if not entirely unknown to the wheat rancher, yet in these times of high-priced grains, every low spot should be properly drained so that a maximum yield could be obtained.

The building of highways and railroads has seriously affected the natural drainage of California grain lands. And until systems of drainage canals and ditches are developed, our lands will have many wet non-productive spots that otherwise are very fertile.

Elimination of Weeds.

To eliminate most weeds—Black

Oats, Sweet Clover, and Morning Glory—requires continued and earnest effort.

1st—Seed wheat must be thoroughly cleaned.

2nd—The method of summer fallowing outlined above is helpful, especially the spring plowing and harrowing.

3rd—Pasturing summer fallowed land with sheep so that the undesirable plants never develop beyond the blossom stage is often very necessary. With Morning Glory and some weeds this must be continued for two years before the land is in good shape.

4th—Black Oats can be plowed under when they have grown three or four inches high in loose soil after the fall rains.

5th—Cutting the wheat with a binder often makes it possible to also cut the weeds before their seeds are mature and thus prevent the infection that is caused by late cutting with a combined harvester.

6th—Every precaution should be taken to see that the combined harvester deposits none of the weed seeds that go into the machine, back onto the land.

Alfalfa Seed

That Produces a Heavy Growth

What kind of land have you? Irrigation not possible? Is your land heavy? Is it sandy? Is it exceedingly wet? Then be careful to select seed adapted to your particular conditions.

Our new booklet tells you what kind of alfalfa seed to plant to get the best results on any kind of land.

It is a compact compendium of valuable information for the alfalfa grower, and points the way to alfalfa success. The booklet is sent free on request, and may save you hundreds of dollars. Send for it today.

BEAN Sprayers

are leaders in many money-saving ways. Dependable, reliable, efficient, furnishing high pressure at small cost.

Valves will not rust out and they can be cleaned in less than two minutes by one not experienced while the engine is running. This is a Bean feature worth investigating.

Write for our sprayer catalog. It explains 10 points of Bean Supremacy.

SULPHUR

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for

bleaching purposes, LEAVING NO ASH. VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Sulphur.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this Sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out in labor for spraying your orchard, even if you pay your men \$4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100% pure. This has increased various crops up to 500%.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur Mixtures, etc., and "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 deg. Be. Fungicides and Insecticides. Carried in stock and mixed to order.

Send for "ILLUSTRATED BOOK-LET"; also booklet "NEW USES FOR SULPHUR." Price-list, and Samples.

THE BEST SOURCE

of Nitrogen
for Citrus Fruits is
NITRATE OF SODA

because of its instant availability as plant food. Growth is promoted immediately after the application is made.

It is taking chances to apply any Nitrogenous Fertilizer which is not immediately Available as food for plants, because of the tendency to unduly prolong growth and to delay maturity. It is also fatal to apply high-grade fertilizers too late.

In California, on alkaline soils or soils having alkaline tendencies, apply Nitrate of Soda with an equal quantity of acid or superphosphate. This combination will tend to diminish any black alkali present.

CHILEAN NITRATE COMMITTEE
231 Douglas Bldg., Los Angeles, Cal.

Place Your Order Now for

Nitrate of Lime

Guaranteed not less than 13 per cent Nitrogen—almost 100 per cent Pure. Nitrate of Lime supplies Nitrogen in the most available form. Packed in solid wooden casks about 240 pounds.

NEWS NOTES FROM NEVADA.

A movement is on foot by the stockmen of the state to immediately eradicate the rodents of the state. Some of the ranchers venture the statement that fully as much forage is destroyed by the rodents as is consumed by the livestock of the state.

The snow in Central and Eastern Nevada last week was quite heavy for this period of the year. Ranchers are now assured of water for irrigating and stock water for the next season. Sheep began to move to the desert ranges immediately, as is the case each year after the first heavy snow.

Farmers near Fallon are elated over a lower freight rate to Utah and Idaho, recently granted by the Rail Road Administration. A rate of \$6.00 per ton is in effect to Ogden. A great many thousand tons of hay will be baled and shipped out of the project at prices ranging from \$20.00 to \$21.00 per ton.

Land in the Rebel Creek section located in Humboldt section is being rapidly filed on. Within the past year no less than seventy-five filings have been made. No less than twenty-five homes will be built this year and wells sunk for irrigation. In many places an abundance of water is to be found at 20 to 25 feet.

The cutting season of the Verdi Lumber Company was brought to a successful close on account of the recent heavy snow. General Manager Nash reports 19,000,000 feet cut during the season, which is the high record for the company. The season opened March 23rd and ended December 3rd. The entire force comprises some three hundred men.

Next year will be one of great prosperity for the Nevada flockmasters, for fully two-thirds of the wool clip has been contracted at prices from 50 to 51 cents. In some instances a substantial advance in the purchase price has been made without interest. One wool grower with 14,000 head of sheep sold the entire clip at 51 cents.

FARMERS' LEGISLATIVE COMMITTEE.

The Agricultural Legislative Committee, representative of producers' organizations of dairy, livestock, poultry and eggs, deciduous and citrus fruits and dried fruits and nuts, has been organized as the outgrowth of a suggestion advanced during the recent producers' convention at Chico. Organization of the committee was effected last week at a meeting in San Francisco, at which representatives of agricultural pursuits were present. The purpose of the organization is to secure legislation favorable to the agriculturists of the state. Each industry will have one member on the committee.

C. C. Teague of Santa Paula, president of the California Walnut Growers' Association, was elected president of the committee, and G. N. Pierce of Davis, president of the California Almond Growers' Exchange, was made vice-president.

An executive committee was selected, consisting of the president and vice-President and five others. They are F. B. McKeivitt of Sacramento, president of the California Fruit Distributors, H. G. Coykendall of San Jose, manager of the California Prune and Apricot Growers, Inc., G. Harold Powell of Los Angeles, general manager of the California Fruit Growers' Exchange; F. H. Wilson of Fresno, president of the California Peach Growers, Inc., and L. A. Nares of Fresno, representing the livestock interests. Permanent headquarters will be established at Sacramento.

The committee as named is representative of fruit and cattle interests. As remarked in our issue of November 22, this committee was designed to represent co-operative organizations in all lines of agriculture and livestock, as well as general organizations for the benefit of ranchers. Apparently such organizations, aside from those handling fruit, were not in at the December 12 meeting. Our bean growers, alfalfa growers, honey producers, poultry men, dairymen, swinemens, and grain men are not represented at all on the executive committee, but it is probably their own fault.

[This is one of a series]

Clean and Safe

These are requisites in spray materials, They are practical details of manufacture and technique.

ZENO

Is clean to handle, safe to apply. It will not hurt the hands or face of the operator, Or the skin of horses. It has been used for years in parks, On tough and tender trees and shrubs, Much more difficult to spray than orchards. It is used to control scale, aphids, mealy bug, Red spider—to clean the tree of black smut, Moss and lichen.

ZENO

Is an internationally used Miscible oil spray, and these are reasons why It has proved the best by years of test.

Organized Farmers Protect Themselves

(Written for Pacific Rural Press.)

The Farm Owners' and Operators' National Association (Santa Clara Unit) is making preparations to increase its already large membership by launching an "Every Farmer a Member" campaign. The trustees have been quietly getting their plans perfected for a systematic canvass of every neighborhood.

Organized as the Farm Owners' and Operators' National Association the farmers will never engage in politics, but they will, so far as lies in their power, demand that in the matter of farm legislation and farm regulation the industry that feeds and clothes the country, state and nation; that pays a larger share of the cost of government than any other single industry; that directly engages almost half the nation's population, must be given a full and fair representation.

Farmers on State Commissions.

Of all the various commissions in the state of California—the Railroad Commission, the Highway Commission, the Harbor Commission, or any of the various other commissions—there is not a farmer on one of them, and as for legislatures, (the men who constitute our law making body), the farmer has nothing to say. Organized capital controls our finance. Organized professions control our laws. Organized business controls our market. And organized labor is seeking to control our employees. For all these the farmer furnishes their only visible means of support. They represent outside of the cities approximately one-half of the nation's population, one-half of the nation's wealth, one-half of the nation's production and pay one-half of the cost of county, state and national government. The farmers feed and clothe the nation and yet, through lack of organization neither the farming people nor their interests are given consideration or representation in business, social or governmental affairs. Therefore it is vital that farm owners and operators should have a county, state and national organization, or a clearing house along broad lines that they may resist the encroachments of other powerful business, financial and industrial, county, state and nation-wide organizations that have properly formed to promote their respective interests, but neither do they know the problems nor are they greatly concerned as to the welfare of the farmer.

Farmers' Reserve Bank.

Organized, the farmers may discover a means of placing themselves on a credit parity with the city borrower. It is a long and expensive journey for the farmer's paper from the country bank to the federal reserve bank, and the borrowing farmer pays the fare at every banking station.

Organized, the farmer might persuade the government to convert the federal loan bank into a farmers' reserve bank, and through the country bank deal directly with the farmers as the federal trade bank through the city bank deals directly with the city borrower.

Road Taxes for Roads.

Organized, the farmer might be able to convert California's annual twelve million dollar county road tax from its present use in building political fences into its proper use of building permanent and modern roads under the supervision of an experienced commissioner.

The farmers are entitled to respect and consideration, and intend through the Farm Owners' and Operators' National Association to demand and command such respect and consideration.

Organized, the farmers might be permitted to participate in the discussion and settlement of the farm labor question, a matter that so far has been handled and "man-handled" by academic agriculturists and city labor leaders, with one exception as noted recently in Pacific Rural Press.

The Farm Owners' and Operators' National Association is not a buying or selling organization. They are organized for the protection of property

rights. It makes no difference whether a man is a fruit grower, grain grower, alfalfa grower, dairyman, gardener, cotton grower, cattle raiser or any other of the various farm industries.

The Farm Owners' and Operators' National Association is not opposed to labor organizations or any other lawful organizations. Their interests are one with every farmer in the country. Farmers are organized to protect their interests as labor unions are protecting their interests by organization.

Deciduous Fruit Experiment Station.

One of the first questions the organization took up at its first meeting in March of this year was the securing of a \$150,000 appropriation for a deciduous fruit experimental station. This station is to be located in Santa Clara County, and it is expected to be in operation by January 1st.

More Taxes on Fruit Trees.

The next question was the increased assessment of 100 per cent on fruit trees by our county assessor. All know that this tax must be paid this year. Through the efforts of the Farm Owners' and Operators' National Association this assessment has been changed for next year to a more equitable basis.

The Tomato Growers have asked the Farm Owners' and Operators' Association to take up the Tomato Growers' grievance to see if they can collect the many thousands of dollars yet due the growers for their 1918 crop.

Water Meeting December 20.

The next step of the association is to take up the matter of water conservation in Santa Clara County. This will be discussed at a mass meeting of all farmers to be held at 2 o'clock Saturday afternoon, December 20th, in the San Jose Chamber of Commerce building. All farmers are invited.

Farm Labor Bureau.

Another way in which the Farm Owners' and Operators' National Association is protecting property rights, especially of the farmers, is through the Farm Labor Bureau, which it is conducting in the San Jose Chamber of Commerce building. Last season this bureau supplied to the farmers in the various parts of the county between fifteen hundred and sixteen hundred workers to help harvest the fruit. This alone is a big item along the lines for which the association is organized. Plans are now being made for conducting the bureau on a larger and better scale next year.

All these things show the association is accomplishing the object for which it is organized.

Several of the other counties have organized with a large membership, and all the counties are in stages of organization. It is the hope of the Farm Owners' and Operators' National Association that before next harvest all the counties in the state will be organized.

U. S. GOVERNMENT LOAN FUNDS.

To the Editor: Is there a fund controlled by the United States Government from which loans, not to exceed eight hundred dollars, for the purchase of live stock, will be made to former soldiers?—R. W. F., Colusa.

[Answered by Chairman Elwood Mead, State Land Settlement Board.]

"The U. S. Government has not provided any fund of the kind referred to. The Mondell Soldier Settlement Bill now before Congress provides for the purchase of land in large areas so as to create community settlements of not less than 100 persons. This land is to be sold on long-time payments. The settler is to be loaned \$1200 to build a house and make other permanent improvements, and \$800 for the purchase of livestock and implements. The bill has not yet come before Congress for action, and there seems to be considerable opposition to its passage in the central and eastern part of the country."

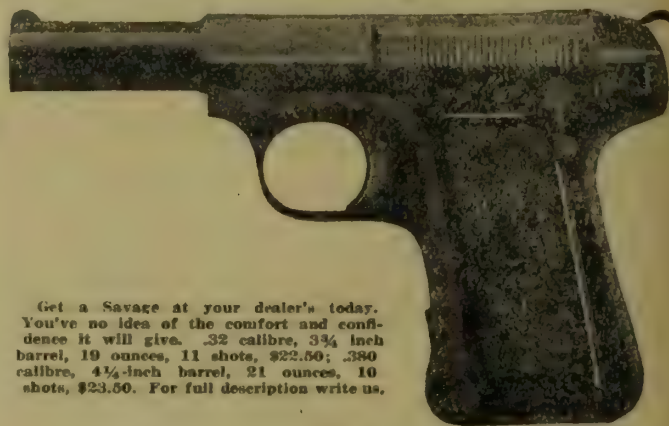

SAVAGE

THE MONEY THEY THINK YOU'VE GOT

All the newspapers say all the farmers have all the money. And all the yeggs and all the gangsters and all the other thugs believe them.

They think you've got it, whether you have or not. And good roads and gasoline—and flivvers waiting to be stolen at every curb—have put the farm in easy striking distance of every city slum.

Have you learned the war's great lesson—preparedness? For you—and your family—that means the ten-shot Savage Automatic Pistol. Ten shots—ten. Its length of barrel and locking of breech give greater penetration and accuracy than other pistols of the caliber. And the original Savage grip makes you point it and shoot it straight as instinctively as you point your finger—makes you shoot it straight in the dark.

Get a Savage at your dealer's today. You've no idea of the comfort and confidence it will give. .32 calibre, 3 3/4 inch barrel, 19 ounces, 11 shots, \$22.50; .380 calibre, 4 1/4 inch barrel, 21 ounces, 10 shots, \$23.50. For full description write us.

PURE ANIMAL MATTER
AMMONIATES

CONSERVE THE MANURE PILE.

[From the State Department of Agriculture.]

Even in California, with its wealth of rich fruit and farm lands, annual losses are suffered through the improper care of manure, waste, and bedding from the stables and pens. I say improper care, but in too many cases there is no evidence of any care whatever.

If the farmer could be shown just how much he lost in actual cash every year, it is possible that more attention would be given this important adjunct of successful agriculture. However, it is not possible to compute the loss in cold dollars and cents, but it is possible to show, in a way, how these losses operate to his detriment.

First we must get down to the hard fact, that no matter how rich your particular holdings may be, there comes the time when you must renew the soil, exhausted of its elements, by your fruit growing or farming operations.

Barnyard manure cannot be duplicated chemically as a restorer of wasted energy to renew the soil or build up the orchard. Hence, you are as dependent on fertilizer to make your farm and orchard "go" as you are on oil or gas for your motor truck.

Why not enjoy the maximum 100 per cent of value from your "compost" instead of permitting a large part of it to become misapplied through leaching and fermentation?

There are large items involved in the improper care of manure which contribute to losses in money, sickness and death from typhoid on the farm, and which are the prime factors in deliberately putting the most destructive insects into your farm and orchard.

The open manure pile in its processes of fermentation, by heat and odor attracts all manner of unwelcome insects that instinctively seek its warmth to deposit their eggs, with the foreknowledge that their brood will be perpetuated.

Within the exposed manure pile may be found the housefly, carrier of typhoid fever, the white grubs, the larva of the fig-eating beetle, the wire-worms and countless others, whose careful parents have placed them there in the form of minute eggs. In a single square foot of soil, where an exposed manure pile had rested, the writer counted as many as 300 minute white grubs (Lachnosterna sp.) and possibly many more that the eye did not detect.

On the average ranch or farm the open manure pile is largely responsible for the entire infestation of houseflies that carry the filthy germs to pollute the milk and food and spread sickness and death that with ordinary care might be avoided. Why not store your stable litter and manure in a tight bin, box, or pit? Wood, metal, or concrete will answer. Much of the value of stable litter is lost through the dissipation of gases and through leaching. This may partly be avoided by providing proper storage receptacles. Our boats go to far Chile for guano in bat caves, and to the bird reservations for phosphates. Almost pure nitre! The experiment station will show you that every chicken on the farm produces approximately twenty pounds of waste high in nitre content each year. That, mixed with five times its bulk of earth, is a valuable dressing, but who conserves it properly. There is an old saw that "money makes the mare go," and we know that "fertilizer makes the farm and orchard go."

SAN LUIS OBISPO 1920 CROPS.

To the Editor: There will be a very small acreage of small white beans in San Luis Obispo County next year on account of the low price this year. The warehouses are full of beans, many sacks of which were left over from 1918. There will be a large acreage planted to alfalfa and Melilotus alba.—Harold E. Alley, County Commissioner of Horticulture.

AGRICULTURAL NOTES.

Demonstration plots of Mariout barley are being laid out throughout San Diego county.

The 1919 corn crop of the United States is valued at \$3,934,234,000, with a total production of 2,917,450,000 bushels.

The total volume of important farm crops for 1919 was \$14,092,740,000, the crop reporting board of the U. S. Agricultural Department has announced.

A campaign is being waged in Imperial county for the keeping of farm accounts and household accounts, which is meeting with considerable favor.

The estimated acreage of peas in the Imperial Valley is as follows: Brawley, 460; Calipatria, 200; Westmoreland, 165; Kimura, 40; total, 865. The estimated production is 85 cars.

One thousand dollars a day was expended in the campaign for eradication of ground squirrels in California during the past year, says G. H. Hecke, head of the State Department of Agriculture.

The country's wheat crop for 1919 is valued at \$2,028,522,000, with an acreage of 73,243,000 and a total production of 940,987,000 bushels. The total production of wheat for 1918 was 921,438,000 bushels.

The production of sugar beets in the United States this season is 6,396,860 tons, worth \$68,750,000, as compared with a production for 1918 of 5,948,798 tons, valued at \$59,494,000. The production of sugar is 6,396,860 tons.

Imperial county voted \$1,500,000 for building cement highways. The Farm Bureau has appointed a committee of one director from each supervisory district to confer with the County Highway Commission for the location of these.

The supervisors of San Bernardino county have appropriated \$1,000 to secure an assistant farm advisor in the county. The farm home department held a series of eight hat-making demonstrations during the month, with an attendance of 128.

The Tulare Register says the biggest crop in the San Joaquin valley is being harvested at the Tagus ranch. For the past month pickers have been gathering the fluffy white bolls. The 860 acres of cotton will make nearly a thousand bales, judging from the yield already picked.

Figures on some important United States crops this year are: Oats—production, 1,248,310,000 bushels, valued at \$895,603,000; barley—production, 1,657,190,000 bushels, valued at \$200,419,000; potatoes—production, 357,901,000 bushels, valued at \$577,581,000; cotton—production, 11,030,000 bales, valued at \$1,977,073,000.

The following is the revised estimate of onion acreage by shipping points in the Coachella valley: Coachella, 1,200; Thermal, 1,160; Indio, 300; Mecca, 40, making a total of 2,700 acres, as compared with 790 for the season 1918-1919. Weather conditions are more favorable than last year and practically no thrips are present. Crop is in fine condition.

The United States Grain Corporation has released for milling a large quantity of California soft wheat to make bread available at lower prices. Millers have promised to co-operate in putting on the market what was known as "Straight Flour" at a price fixed to the consumer. The prices named are \$3.00 for a 49-pound sack, \$1.55 for a 24½-pound sack, and 65 cents for a ten-pound.

Japanese are gaining control of some of the most fertile and largest ranches and farms in Yolo county, according to figures given out by Deputy Assessor C. W. Crutcher. He estimates that the Japanese control 9,000 acres in the county, and of this acreage they have actual title to 320 acres. The records of the assessor's office show that 3,114 acres have been leased to the Japanese, which does not include 5,000 acres owned by the Alameda Sugar Company, also leased to the Japanese. The average price paid for the leased land runs from \$18 to \$35 per acre.

"It Digs Cellars"

"Look at that blast! There's a day's work done with a bang. How long do you reckon it would have taken you boys to loosen all that dirt with

pick and shovel, eh? There's no use talking—when you've got a heavy job of digging, no matter whether it's for tree planting, post holes, ditches, or cellars, there's nothing in the world that'll beat

HERCULES DYNAMITE

"I never knew a tenth of the things you could do with explosives until I sent to the Hercules Powder Co. for their book, 'Progressive Cultivation'. I'd tried dynamite before and it was saving me money but there were a lot of tricks in the game I didn't know until I'd read that book.

"No matter how simple blasting seems, boys, there nothing like knowing the best methods to use—the methods that give you the maximum result with a minimum of expense for material and labor—and this book tells you all about them.

"And the best part is that any farmer or orchardist can get 'Progressive Cultivation' free if he signs the coupon and mails it to the Hercules Powder Co."

Mechanical Power on the Farm

TRACTOR DID RUSH JOBS.

(Written for Pacific Rural Press.)

In plowing subirrigated land, such as may be found in all irrigation districts, the furrow horse frequently mires down while the others have good footing. Geo. Kemp of Stanislaus county had horses last summer trying to do a rush job of putting in beans after an oat crop was off. Water to irrigate after the oats was late in coming, so it was necessary to plow soon and fast after irrigating. Mr. Kemp seemed unable to get horses enough to get the plowing and seedbed preparation done in time; but in his efforts, one of the horses bogged down to the hocks in the furrow. Mr. Kemp got a 12-20 wheel tractor in July and pulled two fourteen-inch plows four inches deep, running one wheel in the same furrow without bogging in.

Foolish to Mire a Tractor.

Three times, however, he has bogged the tractor. It is not a question of power, but of traction. The engine can spin its wheels and then of course digs in where footing is soft or sandy. Experience has taught Mr. Kemp that "digging in" is unnecessary. It is foolish to get a tractor mired down. In almost every case where the machine gets stuck, the implements have "sucked in," thus making too much of a pull. Just as soon as he feels the load getting too heavy on soft footing and before the wheels begin to slip, Mr. Kemp stops. He unhookes from the implement and attaches a long chain which he always carries. The tractor is run a few feet forward to better fresh footing, the implement is adjusted for less depth, and the tractor pulls it out.

Having plowed 69 acres in a hurry this summer soon after irrigation, Mr. Kemp's idea is that in such cases, or in subirrigated fields where some spots will always be too wet when others are dry enough, a light weight wheel machine fills the bill. He has had no experience with track-types. Having worked down the 69 acres with the tractor and an eight-foot double disk going over some of it three times, he says that a six-foot double disk would be better on account of the soft and sandy places. There, time would be saved by having a lighter load. That hot summer work which involved long days, leads him to say that he could not have done the same work in the same time with 20 horses.

Dry Seeding of Grain.

Since the beans were taken off, Mr. Kemp plowed the 69 acres and double-disked it all, before the recent rains. He followed the double-disking closely with an eight-foot grain drill so that sixty acres were planted when the rain came. Without the tractor, the rain would have cut his work in two and would have delayed seeding; or else it would have prevented any of the dry plowing, and all of the seeding would be still to do.

After all of this work, repairs have cost practically nothing, all repair work and adjustments having been done by Mr. Kemp himself.

PUMP DOUBLES ALFALFA YIELD.

(Written for Pacific Rural Press.)

While some ranchers waste half of the alfalfa growing season for lack of pumps to supply water after gravity irrigation gives out, R. M. Diggs, whose ranch lies above King City in Monterey county, had alfalfa fields green and growing the last of October, and other green alfalfa fields were being browsed by his cattle. He gets the equivalent of two or three cuttings of alfalfa per season more than others in the same county whose irrigation plays out earlier. That means something right now with alfalfa land selling at high prices and alfalfa in stiff demand. It means that the pumps pay their first cost and cost of operation, and help Mr. Diggs pay the high cost of living in town. He has

about 225 acres of alfalfa solely for his beef cattle.

The pump system which keeps the alfalfa growing consists of two out-fits and two reservoirs. The big out-fit pumps 3500 gallons per minute, according to James Perry, who has tended it for the past three years. A single centrifugal pump set in an excavation draws water from half a dozen wells through pipes which radiate like spokes from the pump. Since suction lift is considered to require more power than the push lift above the pump, it is located about ten feet below the reservoir water level. 'Twas a good thing this season, for where the suction should be only two or three feet at this location, it pulled down to 22 or 23 feet during the past summer.

A difficulty is frequently experienced in starting the pump, however. Its being below the reservoir water level makes necessary a foot valve in the pipe line above the pump. With pressure on the valve from the reservoir, the pump churched fruitlessly trying to open it sometimes, and has to be speeded up "to beat the band."

After it is open, no more trouble is experienced because it floats in the stream. The pump is kept running almost constantly from April to October, inclusive.

SIERRA POWER OUTFIT LEASED.

In accordance with the announcement made recently to the effect that the Sierra and San Francisco Power Company contemplates the leasing of its operating properties to the Pacific Gas and Electric Company, the Railroad Commission was recently asked to approve the leasing of the plant. The Sierra Company claims a value of \$17,500,000 for the property involved in the lease.

The terms of the lease are as follows: Rental for the year ending December 31, 1920, \$50,000; rental for the year ending December 31, 1921, \$50,000; rental for the year ending December 31, 1922, \$100,000. For each of the remaining years covered by the lease, \$150,000.

AUTOMOBILE IGNITION.

An automobile ignition system having a number of separated units is

just that many times more likely to get out of order. Therefore, one made up of a single unit is most desirable. It must be reliable and provide an intense, penetrating synchronized spark under all conditions. It must be sturdily made and be simple in design. It must require little or no attention.

Naturally it must be unaffected by atmospheric changes, chemical reactions, and the rack and jar of contin-

uous and rough service. The only ignition system that meets these requirements is the magneto. The latest 1920 passenger car designs provide for "optional ignition."

The Mohawk Rubber Co. is making certain sizes of pneumatic motor truck tires, and will have a complete line as soon as the present increase in factory buildings and equipment is finished.

Turlock District to Develop Power

(Written for Pacific Rural Press.)

Petitions were put out December 3 in the Turlock Irrigation District to obtain the 500 signatures required to call an election regarding a bond issue of \$4,108,000. Part of this is to help build the proposed Don Pedro dam on the Tuolumne river about 20 miles above the present La Grange dam, which diverts water for the Turlock district but does not store any considerable amount. The dam is to be built jointly with the Modesto district, Turlock's share being \$2,570,000. The proposed Turlock bond issue covers this and \$510,000 for drainage work and Turlock's share of \$420,000 in the power plant to be located near the dam, and a power distribution system for the Turlock district, which will cost about \$608,000. The dam will be one of the highest in the world, and all water used for power will fall about 100 feet, as pointed out in a report by Chief Engineer R. V. Meikle. All of the power possibilities of the dam and its 250,000 acre-feet of water storage will be required for future needs of the district, which will include pumping for both irrigation and drainage. Temporarily there will be a surplus to sell. Consulting Engineer A. J. Wiley proposes a power plant, which will develop a maximum of 16,000 horsepower during the first nine months of the year when power demands are greatest, and a minimum of 1,000 horsepower during October, November, and December by holding back

a reserve of 22,500 acre feet in low years. Power development of the Hetch-Hetchy project will add 4,000 horsepower to this minimum. Development of foothill districts eventually will require 3,000 horsepower, practically all of which will be used during the period of maximum capacity. There are 300 wet spots in the district covering 50,000 acres where the water level is less than four feet from the surface during the height of the irrigation season. Drainage canals are being provided to receive this water and power will be required to get rid of it. It is safe to assume that 2,000 farmers would use electric power if they could get it at reasonable cost. Irrigation and drainage pumping will require power continuously for six months.

For an irrigation district to thus take to itself the development of electric power with its water before using it for irrigation was made possible by the passage of a law introduced in the Legislature last spring by Assemblyman Miss Esto B. Broughton of Modesto. The Irrigation District directors will control the power development, and bond issues will be made as heretofore made by irrigation districts. The bond election will probably occur in January or February as the 500 signatures are virtually assured. A hundred copies of the petition were taken by farmers and members of the Farm Bureau.

Why Change Oil in Engines?

A campaign to call attention to the necessity of changing oil in motors every so many hundred miles has been advocated by M. L. Pulcher, vice-president and general manager of the Federal Motor Truck Company, Detroit, Mich. He contends that failure to change oil frequently is the main cause of the deterioration of motors. Mr. Pulcher points out that there is so much kerosene in gasoline today that it has a tendency to run down past the pistons, get into the lubricating oil and thin it. The kerosene cuts the thin film of oil on the wearing surfaces of the pistons, piston rings and cylinder walls.

With the film of oil on the wearing parts of the motor broken, friction, the bugbear of motor efficiency, starts in. The pistons work up and down through broken films of oil in a lubricating substance that has lost considerable of its richness and thickness.

There is little chance of changing the quality of gasoline. Therefore, to prolong the life of the motor the only thing to do is to change the lubricat-

ing oil frequently, possibly every 500 to 1,000 miles, he advocates.

An experiment witnessed by Mr. Pulcher recently is instanced by him as proof that it is the non-lubricating qualities of the oil that damages motors.

A motor was brought into a shop with almost .015 inches wear. The motor was ground to .020 inches oversize, fitted with new pistons, put on the block and filled with good, clean oil. The motor was then run continuously for 60 hours and during this time the oil was changed three times.

When the motor was taken down it showed no wear.

The motor was again put together, oil was taken from an old truck and the motor put through the same 60-hour test without any change of oil. It showed .005 inches wear, indicating that it is the non-lubricating qualities of the oil resulting from the kerosene working past the pistons and mixing with it that cause the deterioration of motors.

The age of a motor may almost be said to depend upon the number of times the oil is changed in it.

Novel Uses for Gas Engines

[Written for Pacific Rural Press by Thos. E. Browne, Stockton.]

A novel use for gasoline engine of the light weight type (4HP) is shown in its use for power on a silo-packer at Meister's Dairy in Sacramento. It is said to save \$30 a day in labor costs. This engine can be used also for chore work on the farm.

Byron Bearce of this city is mounting light weight engines for power on a machine for boringholes to prepare for blasting in preparing the ground for planting.

Miller & Lux of Los Banos are building a tule-cutting machine for use in their canals and ditches, mounting a light weight engine on a small barge and operating cutting knives to clean the ditches for a better flow of water. Similar machines have been used by them and others with much success.

The Staten Land Co. are digging potatoes this year with several machines drawn by horses and driven by auxiliary light weight engines. It is claimed that they can harvest three times faster than by hand and also avoid the great losses experienced every year through leakage caused by

careless diggers running forks through potatoes.

The high prices of wheat and barley served to induce some to plant their grains in light soils, where it has been difficult to harvest their crops with the ordinary machines. The light weight engine used as an auxiliary drive on binders, reapers, and headers has enabled these growers to properly harvest their crops in a most satisfactory and profitable way. There are some who are mounting these engines on mowers, making it convenient to cut at any period of even the hottest weather, and to cut the heaviest crops with a reduced cost for wear and tear on machines and team.

A tractor user who is always working while two of his neighbors are frequently fixing their tractors says their troubles are largely due to overloading.

In buying a tracktype tractor it is well to satisfy yourself that the track will not run off its sprockets in turning corners. Some do and some do not.

Float a Ford

SHOCK ABSORBER

Makes a Ford even Better

On Front Springs

On Rear Springs

\$18.50 Per Set

Desirable territory open for live dealers. Write for our proposition.

You know the enjoyable, thrilling sensation of gliding over the ocean swells in a graceful power boat—it seems as if you are just floating thru space with no abrupt jerks or sudden jolts. Your car equipped with Float-a-Ford Shock Absorbers will ride with that same ease of motion—no jolts, no bumps, no side jerks—will glide along “like a boat riding the swells”—every road a boulevard.

Two tested steel valve springs check the downthrust of bumps, while the third absorbs the upthrust of the rebound. They are adjusted to eliminate side jerks. They are attached to the Ford springs, both front and rear, without boring a single hole in frame or axle.

Try a set—convert your Ford into a “land yacht.” If they’re not entirely satisfactory, we’ll cheerfully return your money.

PREPARING YOUR BEANS FOR MARKET.

(Written for Pacific Rural Press.)

It is the writer's privilege to eat beans about five times a week on the average. These beans do not have adobe in them. It is our privilege also to see the beans harvested, and in the warehouses. There is usually more or less adobe in them. This is generally a matter of careless handling. The dirt must be taken out on the road to the consumer and somebody pays the cost. Fortunately, a machine is in use that does this part of the work rapidly. All beans have to go through it because of the careless harvesting of some of them.

Such a machine is part of the equipment of the T. M. & G. warehouse in Turlock, Stanislaus county, as shown the writer by C. W. Kinney, who has charge here. From a hopper, the beans slide over sloping rollers placed close together so they catch the dirt while the smooth beans slide over and off.

There is always more or less chaff and light straw among beans as they come from the thresher, and many of the beans are split into halves. To clean these, they are elevated to the top floor and dropped onto shaking sieves after an air blast has blown over the falling beans. Light stuff separated by the screens is disposed of through a separate chute. The beans then drop into another more complicated sieve cleaner and grader which takes out the splits. Those that go through the various screens are run by separate chutes to half a dozen sackers.

Bean Polishers.

Red Mexicans here and white beans elsewhere are improved greatly in appearance by running through a polisher, of which there are two in this plant. The polisher is a cylinder through which a screw forces beans and sawdust upward until the beans are well polished. The sawdust drops away through a screen and the beans drop to a portable sacker and weigher. This is rolled under whichever bin is to be packed and the beans are dropped first onto the scale. This trips into the sacker any weight for which it is adjusted, so the packed sacks are of uniform weight. Any beans which need recleaning can be turned into other elevators to be run through additional cleaners.

Preventing Weevils in Beans.

The writer once raised a crop of beans which turned out to be buggy. The weevils showed up bad before we found prices showing up good, so we couldn't sell any of them. There are others to this day who lose in a similar way. The best insurance policy against such loss is fumigation as soon as possible after threshing. Mr. Kinney showed us the T. M. & G. fumigator. It has three compartments, each with a capacity of a carload. The sides are double boarded with building paper between and roofing paper overhead to make it airtight. The sacked beans are piled up, not too tightly together, and about seven gallons of carbon bisulphide are poured into as many earthenware crocks distributed over the pile. The door is locked for 24 to 36 hours and the carbon bisulphide evaporates. The beans are then safe for the entire season. Growers are charged \$2.75 per ton for the service and extra handling. Some growers do not have beans fumigated at all, and others fumigate just before shipping, but neither course is as safe as immediate fumigation.

Thirty-four Tuolumne county farmers have asked the Railroad Commission to order the Sierra and San Francisco Power Co to pay them in irrigation water for work they propose to do in repairing the Columbia Canal, so it will supply enough water for their lands.

Rice land near Nelson, Butte county, is selling low. An estate of 2272 acres is being sold at \$110 per acre through the court.

Heavy rains in Arkansas and Louisiana sprouted as much as 20 per cent of the unthreshed crops in some cases.

Remember This Trade Mark
as Well as the Name of

CASE

The world-famous trade mark of the Eagle on the Globe identifies all machinery manufactured by the J. I. Case Threshing Machine Company.

Now, here's a straightforward, heart-to-heart statement of why you should know what this trade mark means to you—why you should give preference to farm machinery on which it appears.

You know the advantage and value of experienced, reliable farm help—the kind you can depend on through "thick-and-thin;"—the kind that "sticks" the year round if you need it!

That's exactly what you get—in mechanical form—when you buy machinery built by this company and bearing the good old trade mark of the Eagle on the Globe.

This company has been building superior machines for farmers for 77 years—probably long before you were born! Often our machines have been a little higher in price than others; but you could bet your bottom dollar on their dependability in "a pinch;"—on better work and more of it and over a long period of years.

Fertilizers and Fertilization--VIII

(Written for Pacific Rural Press by Dr. C. B. Lipman, Professor of Soil Chemistry and Bacteriology, University of California.)

[Note.—The article on "The Importance of Sulphur," page 286 of our issue of August 30, was No. VII. of this series, though proper caption was omitted.—Editor.]

Relation of Lime to Soil Activity.

When the chemist speaks of lime, he means calcium oxide; when the farmer speaks of lime, he means burnt lime or quick lime (calcium oxide), hydrated lime or water-slaked lime (calcium hydrate), ground limestone, oyster shells or similar material (calcium carbonate). Frequently the farmer also includes gypsum under the head of lime materials, but that is indefensible for several practical reasons which we need not discuss here. It will be noted that the materials included by the farmer under the term "lime" not only contain in common the element calcium, but they all furnish, when mixed with the soil, smaller or greater quantities of hydroxyl ion, which is the alkaline factor in chemical substances. It is the factor which neutralizes acid, and hence, is the opposite of the hydrogen ion or acid-producing factor.

Reasons for Lime Materials.

In the literature on soils and fertilizers, you will find the following reasons given for the importance of lime materials in agriculture:

First—They contain the element calcium, which is essential to plant growth.

Second—They contain the alkaline factor above described, which neutralizes acidity in soils.

Third—They exert a coagulating effect on the colloidal components of soils, tending to make them form aggregates, and hence, to give the soil a looser and more friable character. This is of importance principally in heavy clay soils which need physical improvement.

These reasons are generally predicated on the fact of the rapid leaching of calcium from soils and on that of the growing tendency toward an acid condition which characterizes them. In connection with the first reason given, of course, only calcium salts can be considered. The other two reasons, however, do not necessarily imply the use of calcium compounds, since many other substances can displace them for the purposes in question. The fact of the matter is, however, that lime materials are the cheapest and most abundant of any of the materials which might comply with the requirements of the second and third reasons; and among the calcium compounds which might be effective from the point of view of the first reason, they are likewise the cheapest and most feasible to use.

The text books usually add that nearly all soils contain enough of the essential element calcium for all plant needs, either in available or in insoluble form; and that therefore lime materials, agriculturally considered, are important chiefly because of their tendency to neutralize soil acidity and to improve the physical condition of heavy soils. It is chiefly because of the assumption that sufficient calcium is found in most soils to satisfy the needs of plants, that lime materials are not classed with fertilizer materials. In any event, the specific effect of calcium or of its absence on the appearance and quality of plant growth, if such exist, is not known any more than that of phosphorus and potassium, which are discussed in more detail in another memorandum.

Soil Acidity and Lime.

A soil is acid when there is a preponderance of acid over alkaline substances in it. Or to put it in the language of the chemist, a soil is acid when the quantity of hydrogen ion in it exceeds that of the hydroxyl ion. A soil is alkaline, of course, when the opposite is true. Acid soils are widely scattered in all parts of the world, but are much more numerous in humid than in arid regions. Acidity is usually accumulated in soils due to the removal of alkaline materials from them through leaching processes, assimilation by plants, and through the

addition of soil amendments or fertilizers which leave acid residues (like ammonium sulphate).

It has been shown to be true by experiment that calcium bicarbonate disappears rapidly from soils through leaching, that the acidity under these conditions keeps increasing, and that with such increase of acidity plant growth on such soils becomes poorer and poorer as year follows year. Moreover, the application of lime under such circumstances improves the soil as a crop medium in nearly all cases. Superficially, therefore, it appears that acidity as such or the acid ion is the factor in acid soils which is injurious to plant growth. This, indeed, will be found to be the view expressed in practically all soils literature. As in everything else in soil problems, however, the obvious explanation for soil acidity is not necessarily the correct one, as recent investigations by Hoagland, Couter, Hartwell, and Truog, among others, have demonstrated. Hoagland has given the most careful and painstaking consideration to the planning and execution of an experiment to determine the effects of alkalinity and acidity on plants. The results of his experiments were briefly as follows:

Using the barley plant and employing solutions whose acidity and alkalinity were ingeniously adjusted through the employment of series of acid to alkaline phosphates, he showed that the barley plant remains uninjured by much larger amounts of acid than those found in very acid soils in which the growth of the same plant is inhibited. On the other hand, and of less direct interest here, Hoagland found that relatively slight excesses of alkalinity or hydroxyl ion were very injurious to the barley plant.

Acidity Considered.

These results indicate that acidity itself is not the cause of injury to plants; and we are obliged, while recognizing as we have for a long time the method of ameliorating soil acidity, to seek some other explanation than the commonly accepted one for the injurious effects which accompany it. Some of the investigators above named and others have put forward tentative explanations for the cause of the trouble. One explanation is that soluble aluminum and iron salts are found in considerable quantity in acid soils and that they are toxic to plants, hence the undesirable nature of soil acidity. The reason for the presence of soluble aluminum and iron salts in acid soils and their absence in harmful quantity in slightly alkaline soils, probably is that those substances are precipitated in the hydrate form in the presence of free hydroxyl ion and hence rendered inactive. Another explanation is that the calcium of the soil solution is rendered unavailable by the acidity present, or an actual lack of calcium may characterize such solutions. A third explanation is that other elements besides calcium and including nitrogen may be rendered less available in the soil solution in the presence of acidity and that may be the cause of the injurious nature of soil acidity and of its amelioration by lime applications. It can readily be seen that a lime application might induce any or all of such changes and possibly others besides. Until one of these explanations proves correct or some other explanation is advanced which will explain the problem beyond question, we must simply regard the lime and soil acidity situation as follows:

- (1) Soil acidity accompanies or is accompanied by conditions in the soil solution or soil which are inhibitory to the best growth in such soil of many common crop plants.
- (2) The inhibitory factor is probably not the acidity or free hydrogen concentration itself, but side effects induced by it.
- (3) Whatever the nature of the inhibition induced indirectly by acidity, it seems clear that liming of such soil with sufficient lime will largely or wholly overcome the difficulty.

We Manufacture Levelers for Any Power from 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler

WILL WORK WONDERS ON YOUR FARM

Moving immense amounts of dirt daily, and working on ground too tough for horses and Fresnoes to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners' time, labor and money.

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

A GREAT ROAD MACHINE

Every road district should own one of these machines for constructing roads. They will cut down the high places and make fills quicker and cheaper than by any other known method.

YOU SHOULD

send for our latest catalog, J-600, which is full of interesting information on Labor Saving Devices and machines for moving the earth.

Mohawk Is a Quality Tire Through and Through

A little quality in anything is better than no quality at all.

But quality clear through is best. Mohawk tires do not provide you with quality just "here and there"—they are quality-built throughout.

The extra ply of fabric you find in most sizes of Mohawk Tires is one evidence of quality. The pure rubber used in Mohawks and the generous quantity of it is another.

The total absence of "fillers"—rosin, whitening, glue, shoddy, reclaimed rubber—is still another.

But not only are the materials in Mohawks quality materials—the

building of them is based on quality, too.

Mohawk Tires are hand-made. They are made by veteran, expert tire builders. Machinery and less skilled workmanship would be less expensive—but would also lessen the quality and Mohawk builders will not lessen quality.

Eighty-five out of a hundred motorists who use Mohawks will buy no other make of tire. They know that Mohawk Tires are quality tires clear through—and consequently show no deterioration and give longer, more faithful service.

Plain or ribbed Cord or fabric Tires and an extra ply hand-made Ford size, too. Good dealers everywhere carry Mohawks.

MOHAWK RUBBER COMPANY, AKRON, OHIO

Branch: 1436 Van Ness Ave., San Francisco, Cal.

MOHAWK "Quality" TIRES
HAND MADE

With the benefits of liming thus clearly demonstrated for many of our crops on acid soils, the question of the amount of lime to use arises. This question cannot as yet be answered definitely. For practical purposes from two to four tons of ground limestone may be considered a good application and even one ton and less may be used with profit where soils are distinctly acid. Practical measurements of soil acidity are qualitative merely and are made with litmus paper, a test which any county agent or intelligent farmer may employ without difficulty. The only scientific way to determine soil acidity is by means of the hydrogen electrode, which gives a measure of the free hydrogen ion present in a soil. Calcium oxide or calcium hydrate containing equivalent quantities of calcium to those in the tonnages of calcium carbonate above recommended, may be employed on acid soil whenever prices warrant it. This question is almost wholly one of cost of the application, and science shows no other necessary qualifications.

If one of the explanations above given for the effects of soil acidity and liming is correct, calcium may have to be considered on a par with nitrogen, phosphorus, and potassium in its importance as a plant food element, and is a substance necessary as an application on many soils. The differences in cost of these different materials constitute a minor factor in this connection.

In connection with the use of lime for improving the physical condition of heavy soils (clay), calcium oxide and calcium hydrate are best, because they act more quickly than calcium carbonate, but the latter in large quantities may be used advantageously.

LARGE BARLEY ACREAGE WILL BE PLANTED.

The recent seasonal rains have given farmers the opportunity they have waited for to plow and put the land in shape to seed to grain. Before the rains set in about Thanksgiving time, plowing had been more or less spodic over the State. In the Livermore district some of the land had been cultivated. Instead of plowed, while in the lower San Joaquin little work had been done. In the upper San Joaquin, notably Tulare county, large acreages were plowed before the rains. In Monterey county considerable land had been turned over, but much of it was waiting for rain.

The question as to what annual crop to plant has been solved for many growers by the high prices paid for the 1919 barley crop, now selling for about \$3.50 per sack, and the unprecedented advance prices being offered for the 1920 crop. During the past week a large tonnage of barley for next August delivery has been contracted for in San Francisco at \$2.80 per sack.

When one takes the average farm price of August barley of about 80c, which prevailed for ten years prior to 1914 and compares it to the \$2.80, now being paid for this lot, it looks like there would be a heavy planting of barley this winter and that it would pay well if most of it can be sold around the prices recently offered for the lot mentioned.

As a consequence of the heavy seeding, barley for seed may run short. There are many locations in California where barley is a surer crop than wheat. But with the upward trend of barley also comes the insistent demand for wheat the world over and at any price that may be necessary to pay. So we maintain that where wheat is a reasonably sure crop it is the safest bet.

Cotton planting, in addition to giving the San Joaquin Valley an important crop, is developing lands heretofore planted to grains or pasture. The increased revenue, it is pointed out, will reflect in increased land value, and the creation of new communities. Facilities for ginning are to be found in Fresno, Bakersfield and Corcoran. The California Products Company has agreed to maintain loading stations in any community where there is a sufficient acreage to warrant.

100 Cents on the Dollar

THE tractor that is really a 100-cents-on-the-dollar investment for the farmer is the tractor that can be used practically every day of the year, one that is 100% efficient, both on the belt and the drawbar.

The International 8-16 kerosene tractor meets the above specifications. The drawbar has a wide range of adjustment both up and down and sidewise so that the tractor will pull any machine or implement on the farm with equal advantage. The 8-16 pulley is so placed that the tractor can be backed into the belt quickly—so placed also that the belt doesn't rub against any part of the tractor nor drag on the ground. And 8-16 power is just right—neither too heavy nor too light—it fits practically any drawbar or belt power task on the average farm.

Aside from its adaptability for all-year-round farm work, the International 8-16 tractor is a 100-cents-on-the-dollar investment because of its exceptionally efficient and economical (kerosene) operation; because, too, you can always secure repair and expert service without delay through the 92 branch houses scattered over the United States. Your dealer—wherever he is—has a Harvester branch in easy reach.

If you are interested in a 100-cents-on-the-dollar tractor investment just write your name and address along the margin of this advertisement and mail to the address below so that we can send you full descriptive information of the International 8-16.

Carey-ized

Animals Condition Themselves

All animals crave Carey-ized Stock Tonic because it contains the vegetable and mineral salts which they must have to thrive and in which the average ration is deficient. Composed of Powdered Gentian Root, Sulphate of Iron, Bi-Carbonate of Soda, Carbonized Peat, Sulphur, Quassia, Charcoal and Pure Dairy Salt. A guaranteed worm destroyer and conditioner. Approved by leading veterinarians, used for years by thousands of successful stock raisers with satisfactory results. Let us give you the evidence.

Carey-ized Stock Tonic is more than a substitute for the old, troublesome, costly and uncertain method of dosing or drenching. It represents nature's own method of preserving animal health—applies the method of prevention under the guidance of animal instinct. Just place it where your animals can have free access to it all the time—they'll do the rest. They lick it because they like it and it's good for them—a little at a time, every day—as nature dictates.

Cows and Hens on Five Acres

A farm flock of several hundred hens and a flock numerous enough to occupy all a person's time are two different things.

(Written for Pacific Rural Press by D. J. Whitney.)

SOME TIME ago a correspondent wanted to know about starting a five-acre poultry ranch in the Sacramento valley and asked about methods near Tulare, where the Co-operative Poultry Association has succeeded so well that it really has boomed the town and all the country round it.

Henry Wattenberg is one of the directors and first member of the poultry association. Not long ago he sold his ranch and poultry plant and moved on to five acres close to town, where he is operating a small scale dairy and poultry ranch that illustrates a very satisfactory line for any one who is interested in the prospects from such a location.

On the place are kept three well-bred Jersey cows, a horse and 300 Rhode Island hens. There is alfalfa for the stock and it also supplies green feed for the hens. The cows provide a nice little income from their butter fat and the milk is a very important feature in the diet of the hens, which also provide a nice, steady income. Fertilizer is very abundant from both henyard and stable, and the home vegetable garden can produce heavily. The work is light and pleasant, well within a man's capacity, for one man could easily attend to more cows, land and hens than this and do justice to them all.

Ranch Arrangement

The hens are yarded, but have a regular half-acre run that is kept seeded to barley for green stuff. They are also let out a good deal on the alfalfa. This run is more than large enough, as the grass is not eaten down nearly as much as it would be if the run were smaller or the hens more numerous.

In summer the cows are kept in the corral and fed hay and green-cut alfalfa. In winter they have the run of the alfalfa field. They also are fed beet pulp to make a soft, green feed, to keep them in prime condition and to keep the milk flow at its best. The place is large enough under the system described to provide all the alfalfa needed for the stock. The feed for the hens, except for grass and milk, is all purchased.

The cows average \$22 a month each for about nine months for butterfat, or approximately \$50 a month for the three the year round. The feed bill for the hens runs close to \$40 a month. At present with a large number of the fowls too young to lay, the income is \$75 a month. When all are laying the egg production will be much heavier and the feed bill little, if any, more. By making an effort it will be clear that far more hens could be kept on a place like this, and one man could still take care of them and milk more cows. The ranch, however, is not planned for big profits, but to make a fair, steady, well-balanced income without too much toil or confinement. It is Mr. Wattenberg's method of retiring from heavy work, to lighter, pleasant work that will still provide a good living.

No Breed Rivalry.

Rhode Island Reds are selected in place of Leghorns, mainly because on such a small place they can be confined easily without building too high fences. As to a breed argument Mr. Wattenberg says that he does not see a hand-breadth's difference between the two types of fowls in the long run. The advantages of one breed are balanced to a nicety by advantages of the other breed. Leghorns lay earlier and lay more eggs, and do not cost as much to feed. Reds lay better during cold weather when eggs are high and they bring far more for meat when their laying days are over. Pay your money and take your choice.

The combination of eggs and cows is a good one, not only because the alfalfa grown for the cows supplies green feed for the chickens, but because the skim milk is exceptionally

valuable for the chickens. One Jersey cow will provide enough skim milk for 100 hens. A Holstein cow would balance up far more hens and on the other hand would need more land to supply her with feed.

Hen Feed.

Every poultry journal talks a lot about the need of wheat for hens. Here, as on nearly every ranch in the district, milo maize is the standby in the grain line. This is fed on this ranch in straw at the rate of 10 pounds a day per 100 hens, a third of it in the morning and two-thirds at night.

In addition to this and the milk and green food, a dry mash is kept before the fowls all the time. "If you want eggs," says Mr. Wattenberg, "be generous with the mash. If you have only an ordinary farm flock and expect only an ordinary amount of eggs, you can get along with grain and whatever else the hens will pick up, but if you want lots of eggs, feed a lot of mash too."

This advice and practice is universal in the district. People might expect that in a fine country district like this, where so much stuff was raised, nothing from the outside would need to be purchased, but carload after carload of mash and other special poultry feeds are received by the poultry association and sold to persons who, almost without exception, are ranchers who have fowls only as a side line.

Another Farm Flock.

F. P. Storms, a prominent fruit rancher of the district who has a flock of Reds of the approximate size of Mr. Wattenberg's and who raises all the milo maize they eat, purchases half of the poultry feed outside. Purchased feed is mash and rolled barley. Almost no wheat has been fed for quite a time. Both flocks are used to provide eggs for hatching in the hatching season, so there is plenty of vigor from the feed named.

According to Mr. Wattenberg it is the variety in the mash that gives it its value. No meat scraps have to be fed, owing to the skim milk, though there are meat scraps in the mash.

For curiosity's sake the things used in making the mash can be named. One brand contains bran, shorts, middlings, flour, corn grits, bean meal, bone meal, meat meal, coconut oil-cake meal, oat meal, charcoal. Another contains wheat mixed feed, meat scrap, wheat shorts, rice bran, rice middlings, ground oats, ground grain screenings, ground blackeye beans, coconut meal, corn feed meal, ground milo, bone meal, salt.

Raising the Chicks.

Although various details of poultry raising are almost unanimously agreed upon in the district, the best way to raise the young fowls seems to be a matter of personal opinion. Day-old chicks are popular in the section, largely, no doubt, owing to the fact that people in the district want to have good-sized flocks and to the fact that the greatest proportion of those flocks is composed of Leghorns, which are poor setters and poor mothers. The poultry association handled 75,000 chicks last season and one local hatchery supplied 50,000 to customers, to say nothing of what were hatched in incubators here and there.

Mr. Wattenberg's taste runs toward using hens for mothers if one's flock is not too large. Mr. Storm, with an equal number of hens, buys baby chicks and states that it means work and care to have success with chicks whether they have mothers or not. Last year they gave the chicks to hens which they had allowed to set until they were very broody. They bought 500 chicks and put them with 27 mothers. A big trouble was that the chicks selected favorites and every evening they would want to pile up with just a few hens, so to prevent crowding it was necessary to go out

early every evening and make an even distribution.

In both of these flocks the general rule is to dispose of a hen when she has finished her third year. That is, if she is three years old in spring, she is sold when she stops laying in summer or fall. A good deal depends upon the merit of a hen whether she goes to the market earlier or later than this. Since good heavy hens are worth about \$1.60 when sold through the Poultry Association, the meat side of poultry farming pays well. Counting money received from both egg and fowl sales, Mr. Storm's gross poultry income from a flock of about 300 hens as a rule has run not far from \$100.00 a month. Not bad for a side line.

A True Poultry Farm.

A few words may be said in closing about the idea of a big poultry plant in a true farming district. L. S. Fisher has a ten-acre ranch planted to alfalfa and grain in regular farming style, but keeps 800 hens and has a big flock of young fowls coming along, making a poultry plant equal to that of a regular poultry farm in real poultry centers. He also keeps several cows and considers the skim milk of each cow worth \$5.00 a month to the hens. The alfalfa feeds the cows and helps with the hens. The other five acres, by irrigation, produces a crop of wheat in the winter and a crop of milo maize in the summer to cut down the outside feed bill.

Barley is sown in the family orchard in August or September, and by the time that the cold weather has stopped alfalfa growth, it supplies green stuff for the fowls.

According to Mr. Fisher, the proposition of a farm flock of several hundred hens, and a flock numerous enough to take up all a person's time are two things utterly different. A farm flock, he says, ought never to run over 500 or 600, and 300 hens will do better in proportion than 400; but with any kind of care or suitable free range 300 hens are none too many.

With his large plant he has divided his hens into several flocks to prevent overcrowding in any one. One flock always has the run of the barnyard, which is the finest place possible for them. The genuine farm district is the place for hens, says Mr. Fisher, and of all lines to go with fowls nothing can beat the dairy cow.

AUTOMOBILES COMPETE WITH ELECTRICITY.

"The electric railways have met in the recent past a most formidable and determined competitor—the automobile. Both the private automobile and the jitney have made enormous inroads on the passenger traffic that was formerly dependent upon electric railways. The automobile truck is an even more serious competitor in the freight traffic field, for the electric interurban railways almost without exception are depending for their freight revenue on short-haul business. And yet it is clear that both the passenger automobile and the freight auto truck as competitors of the steam and the electric railways are even now only in the first stages of their development," says the recently issued annual report of the State Railroad Commission.

"We do not believe," the Commission says, "that obstacles should be thrown in the day of the economic evolution we are now witnessing in the transportation field. And if the motor vehicle can give better and more efficient service at a lower cost than other forms of transportation, then it would be unwise and indeed, in the long run, ineffective, to interfere with such a development."

The new "1,600" variety of rice yielded nearly 61 sacks per acre on 210 acres near Meridian, Sutter county.

Cattlemen Should Wear Brand, "C. C. A."

(Written for Pacific Rural Press by Thos. F. McConnell.)

During the week of the California International Live Stock Show the California Cattlemen's Association held meetings for the purpose of discussing as many phases of their business as it was possible and profitable at that time. Especial attention was paid to proposed legislation affecting the cattle-raising industry, especially that supposed to be inimical to their interests. Men prominent in the cattle business, both from a purebred and market standpoint, were present and took part in the discussions.

The Small Cattlemen Missing.

It would seem as though with the array of business ability present at that time, that much good must result in the way of promoting the organization. It was conceded by the members present that much had been accomplished in work that would redound to the benefit of all men interested in the business, but it was vitally necessary to have a much greater percentage of cattlemen actual members—and working members at that. The very men who would be the greatest beneficiaries from such an organization were notable chiefly through their absence. These are the owners of small bunches or herds of cattle, say from a dozen to one hundred head. It is easy enough to get the men who own hundreds and thousands of cattle to attend these meetings, at least some of them, but the owner of the small bunch says to him-

ask who is to do this? Every man that is now a member of the C. C. A. is to appoint himself a committee of one to start on this "round up" right now, inside of 24 hours, and get at least one new member in that time, and tell the new member that he must get new members too.

You don't know what to say? Write to your secretary then, and he will tell you why all cattlemen should belong to this organization.

To an outsider—although every man interested in livestock in any way can hardly be called an outsider—it would seem vital that the cattlemen of California should have an association to act for the entire membership in the many conditions and emergencies requiring concerted and immediate action. To begin with,

This Is a Day of Organization.

Every business is being organized to further its own interests in every way where concerted action would be beneficial. Some of these organizations are of men, when compared to the cattlemen, situated almost in speaking distance, one with the other, and where it would seem as though concerted action could be obtained without an organization. They have found, however, that as association pays and pays big if the units composing it hang together. If one man in each township in the State should write to the Legislature about any subject or law on which they wished

same oil was selling for \$1.40 on San Francisco Bay. An organization was formed, known as the Independent Oil

Producers' Agency. Within a reasonable length of time the same producers were receiving 60 cents a barrel

self, "Oh, let Mr. Blank go, he and his friends will run the association anyway, so there is no use of my going."

Now here is one important point at least. The small man, we will call him, has gotten so in the habit of seeing the big fellow run things that he stays away because he sees absolutely no use of going. He thinks he won't have any chance to say anything, and if he does that he will be out-voted anyway. He is "from Missouri" and will have "to be shown." You may call all the meetings in San Francisco or Los Angeles you have a mind to, and in the different "zones" and read minutes, listen to eloquent addresses, and pass resolutions, yes, and subscribe money too, but next year you will be a little further along may be, and the next year or two you will stagnate, and then first thing you know, there won't be any meeting at all.

Have a "Round Up."

What are we going to do? Don't you know? You cow men ought to know. You have been raising cattle year in and year out for only the Lord knows how long. Well! You all start out at least once a year and have a "round up." You don't call a meeting down at ranch headquarters for a certain date for the cows and calves, and steers to come in and be counted and branded. Oh, no! You all know that would be absolutely foolish. You start out, you and your men, and and "ride the range" from sun-up to sundown, and every last cow, calf, and steer has to come in and take part in that meeting.

You know the answer now. Have a "round up." You have the State already divided into zones, and subdivided, perhaps, but you who are public-spirited and unselfish, and know that you are "your brother's keeper," must "ride the range" of your own locality, and see that each cattleman has the brand C. C. A. on him. You

favorable action, it would have but very little effect. But if on the other hand there is an organization within each county in the State having a membership of, say 50 per cent or more, of those interested, and the executive units of each county association notifies the legislature that action is wanted on a certain bill, results are more certain to follow. Then, if there is a strong central organization in the State and they go to the legislature, or governor, or whoever it is that has the necessary power to grant what they wish, results are even more certain to ensue.

Meet Combination with Combination.

We know that cattlemen live their life in the open, many of them widely separated, and it is hard to get in touch with one another even in this day of telephones, and aeroplanes. Things have always gone along pretty well, and they cannot see just the necessity for an association, but they must be made to realize that the interests that buy their cattle and slaughter them have probably the strongest organization of any business outside of Wall Street in the country. They can do with your cattle, so far as setting the price is concerned, just what they please. They are much more apt to get favorable action on laws in the State legislatures or in the Congress of the United States than the millions of unorganized cattlemen of the country. But what if these millions of cattlemen were acting as a unit through an association? This would be different, it would seem to anyone who stops to think about it.

For purposes of illustration we will take an entirely different business—that of the oil producers of California (outside of 3 or 4 large companies like the Standard Oil, etc.), chiefly located in the southern end of the State. Fifteen years ago they were getting 18 cents a barrel for their oil, and the

DE LAVAL

LETZ DIXIE

GRINDS ANYTHING GRINDABLE

HALVES YOUR FEED COSTS

By feeding ground feed instead of whole grain you utilize the 20% of grain which, fed whole, goes through undigested—a dead loss!

By grinding your own feed you can turn your alfalfa, roughage and concentrates into the finest, most nourishing of balanced rations and market your grade A crops; thus cutting your feed costs a good 50% and raising better stock to boot.

But do the grinding the cheap, quick

and easy way—with a LETZ. Beats all other processes in fine cutting, light running, capacity, durability.

All due to famous, patented, self-sharpening, steel grinding-plates—have thousands of keen-cutting, scissor-like edges that in one operation cut, grind, and pulverize powder-fine anything fed into them. Won't clog on wet stuff. Silent. Power-saving. Self-sharpening. Outlasts 3 sets ordinary plates.

COULSON CO. - - - Petaluma, Cal.

for their oil, and it was selling on "the Bay" for \$1.20 a barrel.

An excellent illustration of what can be done by an organization making it more profitable, both for the producer and consumer. So smoothly and equitably did their agency operate that they never became involved in any litigation for 13 years, although carrying on a business of \$1,000,000 to \$14,000,000 annually. Here were men doing business in congested areas, but doing it unprofitably until organized. Now the beef cattle business has been a good one, and it will continue to be so if it is properly handled, but it certainly

Needs the Get-together Movement

as badly as the dairymen need it and are getting it. Not an organization that is for the benefit of the few, but on the broad principle of benefit for all. The deciduous fruit men, the dairymen, the raisin men, the walnut growers, the almond growers, and the citrus fruit growers have all organized successfully and have realized the benefits as soon as they are fully equipped and doing business. They have gotten ahead of the beef cattle men because they lived closer together, and it was comparatively easy for them to get in touch with one another. For all that, it took time and solicitation to get them together, but it has been accomplished. They had to be rounded up, and made to realize the benefits of organization.

It is doubtful if the Cattleman's Association can become as much of an

influence as quickly as these other organizations, but they certainly are in need of it as badly as any other people, and will get it just as soon as they can be made to realize that they can organize and that it is the only thing to do to protect themselves and the consumer. At the present moment cattle on foot are much lower than they were months ago, but beef to the consumer is no lower. Who is getting the benefit but the packers. If the cattlemen were so organized they could say to the packers, "You must pay us more or sell to the consumer for less." As soon as the consumer could get meat more cheaply, he would buy more freely. This would

Create More of a Demand for Cattle,

which means at least a stronger market. Some few things have been told you what to say to the man to whom you are talking and trying to convince that he should cease being a maverick and wear the brand "C. C. A." You should have a range boss who will call for reports every two weeks, and if his range does not report enough new members branded, find out why. Get busy now, you cattlemen, this is a "round up" that begins now if you want results.

When power explodes, there is produced, almost instantly, a volume of gas approximately ten thousand times as great as the volume of powder.

An Egyptian cotton gin and seed mill are proposed for Tulare.

Livestock Queries and Replies

(Written for Pacific Rural Press.)

Feeding Troubles.

To the Editor: We are having feeding troubles. We are old subscribers, and as your answers to queries always help, have concluded to ask your assistance. We have lots of spineless cactus and have been feeding our cows as much as they would eat, about 40 lbs. per cow daily, cut up fine, 20 lbs. barley hay, with a dry mash of 10 lbs. alfalfa meal, 1½ lbs. cottonseed meal, 3 lbs. Suremilk, and 2 oz. salt. They run on free mountain range, which is very short and dry at present. The cows are Jersey, and do not give as much milk as they should. Can you tell me how to improve the above ration? Is there any food value in swamp tule grass? We have unlimited cactus, but fed in excess it is too laxative. Hoping you can help me as you have helped others.—W. Van D., Sunnyside, San Diego Co.

(Answered by Livestock Editor.)

Try 40 lbs. cactus, 15 lbs. barley hay, 3 lbs. cotton seed meal, and 3 lbs. heavy middlings or Suremilk, leaving out the alfalfa meal entirely, and reducing the barley hay, and doubling the ration of cottonseed meal. You might add one-half to one pound more of the cottonseed meal or middlings. You have been feeding too much dry matter, or the ration is too woody. More cottonseed meal will help correct the loosening effect of the cactus. Along the sea coast or near it, not as much salt is required as in the middle west, where there is no salt in the air, or alkali in the soil. You have been feeding much more salt than is good for your cattle. In the middle west, cows will eat about ¾ ounce of salt daily for each 1,000 lbs. weight. Cut down on the salt to about that amount for each cow, or place lump rock salt where they can have free access to it. It should be in a sheltered place during the rainy season. Information as to the feeding value of tule grass is not available from a scientific standpoint. Probably it is rather hard to digest, carrying a large percentage of dry matter to digestible nutrients.

Beet Pulp for Dairy Cows.

To the Editor: Is it advisable to feed a cow all the beet pulp she will eat? Will it give her tuberculosis?—Wm. R., Manteca.

(Answered by the Livestock Editor.)

Beet pulp is considered very good feed for dairy cattle either dry or wet. It has been fed liberally many times

with no injury whatever. Wet pulp might possibly cause scouring if fed in large quantities without any other feed, but any reasonable quantity especially if fed with a little hay, is excellent. If the cow likes it and does well (that is, gives plenty of milk), feed her all she wants. Beet pulp cannot cause tuberculosis. Absolutely no danger whatsoever.

Dehorning Heifer.

To the Editor: Will you tell me through the columns of your valuable paper if there is anything that I can put on the horns of a two-year-old heifer to prevent pain when she is dehorned?—J. S., Berry Creek.

(Answered by the Livestock Editor.)

The only local anesthetic for such work is not available for ordinary use and it would be very difficult to administer if it was available. The only way to look at the proposition is to realize how much more pain the said heifer is liable to cause other animals and even persons with her horns on than off. Remove the horns close down to the head cutting just below where the skin joins the horn with a sharp fine-toothed saw or two-bladed dehorning clipper. Apply plenty of pine tar and watch carefully to see that the wound does not become infected with maggots.

Horses Eating Boards of Corral.

To the Editor: I have two horses whose evident purpose and intention is to eat all the boards in the barn and those around the corral. This habit has but recently started. They are rolling in fat and have all the salt they want. What can I do to stop them as it is very annoying and rather expensive?—L. F., Orosi.

(Answered by the Livestock Editor.)

When you say habit you have given this trouble its right name. It is generally taken up by horses that are worked but little and are confined closely. It is rather hard to overcome sometimes and all sorts of plans and devices are used out hard work is the best remedy. Even that is useless in some cases. In the stable the manger and boards within reach may be covered with sheet iron or driven full of nails. Soft soap that is strong in free alkali will discourage them sometimes, but it is difficult to cure if the habit becomes well established. It is like some horses that will kick in the stable when they are idle as long as they can reach anything.

The Chester White Will Start You Right

Large litters, easy feeders, quick developers, low shrinkage in slaughter, premium carcasses—these are a few of the features of the Chester White, the profit-making hog.

Our last carload shipment dressed 72.30 per cent and brought 1½¢ above the market price.

Largest Herd on the Coast

Over 100 mammoth brood sows, headed by **HIGHLANDER**, the \$1,000 Grand Champion boar, whose sire and dam were both undefeated Grand Champions at three International shows. His pigs are corks—the kind you want.

ORDER NOW—AVOID DISAPPOINTMENT

The demand is keen. Get your order in early. We have a wonderful lot of tried sows, open and bred gilts, service boars and weaned pigs, representing the finest blood lines in America. Prices reasonable. Write us your wants.

Dairy.

A new process dry-milk factory has just started at Newman. The trial run was a complete success. The process dries the milk without boiling.

T. B. Purvine of Petaluma reports a good demand for Jerseys. He recently sold a fine service bull and 3 bull calves to neighboring breeders and dairymen.

Prof. C. L. Roadhouse of the Dairy Division of the University of California Farm, Davis, was elected president of the Western Dairy Instructors' Association, at its recent meeting in Portland, Oregon, it was announced at the State University.

Leeman & Kilgore, Holstein breeders of Ripon, have five very promising cows and heifers to freshen soon, that carry every indication of good records in the near future. Their young stock is looking very good. They have a King Mead of Riverside heifer, that will be consigned to the next Guaranty Sale, which will be an attraction.

Fresno County dairy products have increased in value from \$2,000,000 last year to \$3,116,190.65 this year, according to the report of F. W. Andreason of the State Department of Agriculture. This shows an increase of over one million dollars, which is pretty good for a county that has an outside reputation for being a raisin grape locality.

The National Milk Producers' Federation held its annual meeting at Chicago this week. This was the most important meeting ever held by this organization. The results of the various vicissitudes through which the branch organizations and individual members passed the last year were taken up and discussed. We expect to give some of the details next week.

Lulu Alpheia of Ashburn, 375710, is the name of the latest yearling Jersey champion heifer. She was started on test when she was 22 months of age, and produced during the year 13,668.7 lbs. milk and 800.08 lbs. butter fat. This heifer was bred by J. M. Dickson & Son of Shedd, Oregon, and sold by them to J. J. Van Kleek & Sons of Beaverton, Oregon, for \$150. This record has never been equaled by a yearling of any breed.

Aralia De Kol Mead 2d, a junior 4-year-old Holstein, owned by A. W. Morris & Sons Corp. of Woodland, has just completed a 7-day record of

32.03 lbs. of butter. This is the second daughter of Aralia De Kol Mead to pass the 30-pound mark.

George Kounias Registered Stock Farm reports the sale of a young son of King Hengerveld Ormsby 7th, out of a 23-lb. cow, to a breeder and dairyman at Ingomar; and a grandson of the King to a dairyman at Merced.

J. C. Marquardt of the University Farm, Davis, has gone to Los Angeles to assist in the milk contest to be held by the City of Los Angeles Health Department, as announced by Dean T. S. Hunt, of the California College of Agriculture.

Jerseys of the Mossdale Farms, Lockeford, owned by J. E. Thorpe, are always in fine condition. Mr. Thorpe is a good feeder, and his stock, both hogs and cattle, show the effects of good care given them by their owner and his herdsman, Mr. Hitchcock.

Two new State records for Holsteins were established during the month of November in the yearly tests of purebred cows in California, according to reports made public recently by the California College of Agriculture. Miss Aaggie Acme Burke, owned by the A. W. Morris & Sons Corp., Woodland, produced 16,091 lbs. butter fat in 7 days, 8 months after calving, as a junior two-year-old. Ruby Pietertje of Forest Hill 2d, owned by W. J. Higdon of Tulare, produced 31,792 lbs. of butter fat in 7 days, as a 4-year-old.

W. H. Dupee, proprietor of the Edgemoor Farms, Santee, and breeder of the finest Guernseys, has sold recently the bull Itchen Daisy's May King of Langwater 17349 to Leander F. Herrick of Worcester, Mass., for Anderson Tiffin Herd of Herdlea Stock Farms of New Hope, Penn. The price is said to be \$20,000. Mr. Dupee is very reluctant to part with this bull, and reserved the privilege of breeding a limited number of cows to this great sire. The progeny of this bull are in great demand in the East, as is shown by sales at private treaty and auction as well.

The State Dairy Council held a meeting at Petaluma last week, at which Dean H. E. Norman of the University Farm, Davis, Prof. C. H. Rubel, Assistant State Leader of Farm Advisers, Sam H. Greene of the State Dairy Council, and G. E. Merrill, Farm Adviser of Sonoma County, were the principal speakers. A similar meeting was held at Valley Ford, and a branch of the Dairy Council was formed by electing J. R. Gallagher of Bodega, director; Arthur Purvine, Two Rock Valley, vice-director. Executive committee: E. Steinbach, Two Rock Valley; M. A. Luce, Santa Rosa; S. Gambonini, Lakeville; Arthur Le Baron, Valley Ford.

Swine.

N. K. Horan of Lockeford has now over 300 hogs on his ranch. He has developed a great swine-breeding establishment, which is well equipped with modern buildings.

Karl A. Hess of Dixon is starting a new Duroc-Jersey ranch with a few Shorthorns also. The place will be known as the Putah Creek Ranch, and Mr. Hess intends to stock it with the best animals he can obtain.

McCarty & Starkweather of Modesto have recently sold a boar sired by Kansas King, out of Miss Nebraska 2d, to H. L. Graham of San Fernando; also one sired by King Jones Over, and out of Movie Actress, to F. M. Woods, Jr., of Menlo Park.

The second number of "Purebred Squeals," the "Agricultural Club" paper of the Kern County High School, tells how the Security Trust Company of Bakersfield, and particularly Manager Arthur Crites, has financed the "Club" boys in their livestock ventures. The Trust Company has loaned the individual members a total of \$4500, of which \$4190 has been invested in purebred livestock. The only limitation placed upon the boys is that the money must be used for Agricultural Club pur-

poses. This is a move in the right direction by Mr. Crites, and marks him as a farsighted and public-spirited business man.

There are rumors of a large purebred hog ranch to be started soon on what is known as the Turner Ranch, near Cedarville, in Modoc County.

They expect to have at least 200 brood sows.

Orland is getting to be a swine-breeding as well as dairy center. W. T. Hollingshead & Sons report the recent sales of 18 head of their fine Duroc-Jerseys. Among these sales were two sow pigs to Rolland Fallia,

40 DUROC-JERSEYS 40

PUREBRED AUCTION SALE SUPREME!

40 Bred Sows consigned by the
Members of the California Du-
roc-Jersey Breeders' Association.

These sows are of the very best breeding and have been selected with great care so that those intending to get into the hog-raising game right will have an opportunity of obtaining what they want at this sale.

The Duroc-Jersey is the hog that attracts the buyer's eye because the type is fixed, producing a uniform, quick-growing animal that is fit for the market at any age.

If you want to start a herd or make an addition to a herd, this is your chance.

Hamilton City; a spring boar to C. Ruff of Pasakanta; a spring boar to Smith & Hurni of Orland; a gilt bred to Uueda Sensational Defender to A. C. Havens & Son, Orland; a boar to Mrs. Jas. Mills, Sacramento. Looks like a good business.

W. A. Young of Lodi, who breeds the finest of Poland-Chinas, is fixing up on his ranch near Clements. He will have his Fesenmeyer boar, Young's Timm Jones, on this ranch. Mr. Young will also have some of his stock on his ranch at Youngstown.

J. F. Lehman, the breeder of Poland-China swine that win prizes when shown, reports business as having been good this fall. He reports having sold 11 boars at an average of \$108 each. Also a recent sale of a Golden State King gilt to Geo. F. Starin, of Lodi, for \$250. Mr. Lehman has three spring boars left that are good enough to go in any Poland-China herd. One of them was the grand champion at the California International at San Francisco.

Members of the American Berkshire Association at their annual meeting in Chicago, during the "International," elected James Dodge of Hood Farm, Lowell, Mass., president, to succeed Dean C. F. Curtiss of Ames, Iowa, who has been president for a long term of years. California was the second State in the Union in the number of transfers.

The grand champion single barrow, and the grand champion pen of barrows, went to the Poland-China breed this year at the Chicago International. They were exhibited by the Missouri College of Agriculture. The grand champion carlot of fat hogs went to the Hampshires. They were shown by Gus Meyer, Elwood, Indiana.

Dr. J. P. Iverson, State Veterinarian, reports the health of stock throughout the State as about normal. Anthrax, that was in evidence during the hot weather, is now cleaned up. Hog cholera, and swine plague, have about disappeared. A so-called mysterious disease among sheep in some localities is chiefly due to a lowered vitality, and excess of poor feed, like rice straw and stubble.

W. L. Frasier, of Ripon, believes in letting the boys have a chance. His sons, Wallace and Byron, bought a sow at the Marsh-McCracken sale that has farrowed 9 pigs, of which 5 sow pigs are living. Mr. Frasier is going to back the boys still further in the swine business, as they have raised some pigs that are to be sold, and the money turned over to them for further investment in the hog-raising business.

Beef.

Among the well-known breeders of purebred livestock, visiting the Chicago International this year, was H. M. Barngrover of Santa Clara, proprietor of Veramont Farm, and breeder of Herefords. He is bringing back two highly-bred bull calves, with the idea of having something good enough to breed to the calves of Patrician 5th.

SERVICE JERSEY BULL, bull calves, Financial King blood, Chester white boars, prize winners. Best blood, type, production. N. H. Locke Co., Lockeford, Cal.

SUNSHINE FARM JERSEYS — Tuberculin tested. Production counts. E. E. Greenough, Merced, California.

FOR SALE — Purebred Jersey bull, Noble of Oakland blood. S. B. Campbell, Ripon, Cal.

Holsteins.

THE LEWIS COMPANY BAYWOOD HERD OF REGISTERED HOLSTEINS

Herd sire Ormsby Segis Marie Lad, whose dam has produced in two years, beginning as a three-year-old, 57481 lbs. of milk and 2243 lbs. of butter.

First National Bank Bldg., San Jose, Cal.

FOR SALE — 2 bulls ready for service from A. R. O. dams up to 29.61 lbs. butter in seven days. Sired by best bulls in California. Also 2 bull calves. Every one splendid individuals — mostly white. Write for photos and prices. J. H. Posty, Box 15, R. F. D., Atwater, Cal.

REGISTERED HOLSTEINS for sale. Seven bred cows, one Pontiac bull, 5 years old; also two heifer calves. Subject to registry. Wm. M. Little, Box 76, Snelling, Cal.

YOUNG HOLSTEIN BULLS — Excellent breeding and individuals. Satisfaction guaranteed. Pecho Ranch and Stock Co., San Luis Obispo, Calif.

THE VICTORY HERD — Registered Holstein cattle and Duroc Jersey swine. H. E. Spires, Hilcrest Farms, Caruthers, California.

A FEW YEARLING registered bulls by King Morco Alcartra 2nd, from good producing cows. H. M. Cross, Merced, Cal.

PALO ALTO STOCK FARM, Palo Alto, breeders of registered Holsteins. Heifers and service bulls. Reasonable prices.

CREAMCUP HERD — Register Holsteins Pontiac bull calves. M. Holdridge, Rt. A. Box 437, San Jose, California.

TWO EXTRA GOOD Holstein Bull Calves — Well bred, well grown and priced to sell. E. M. Morrow, Modesto, Cal.

F. H. STENZEL, SAN LORENZO, CALIF. — Breeder of Registered Holsteins. High test producers.

J. W. BENOIT, Modesto, Calif. — Breeder of registered Holsteins.

REGISTERED HOLSTEINS — Best blood lines of the breed. R. L. Holmes, Modesto, Cal.

REGISTERED HOLSTEINS and Duroc-Jerseys. Sturgeon Stock Ranch, Tulare, Calif.

REGISTERED HOLSTEIN BULLS with world's record backing. Kounias' Registered Stock Farm, Modesto, California.

REGISTERED HOLSTEINS — A. W. Morris & Sons Corp. Importers and Breeders, Woodland, California.

REGISTERED HOLSTEINS — Best blood production. Leeman and Kilgore, Ripon, Cal.

GOTSHALL & MAGDEUER — Breeders of registered Holstein-Friesians. Ripon, Calif.

CHOICE HOLSTEIN bulls for sale. No females. Millbrae Dairy, Millbrae, California.

EL DORADO HERD OF HOLSTEINS — Alex. Whaley, Tulare, California.

REGISTERED HOLSTEIN CATTLE — E. B. Freeman, R. B., Modesto, Cal.

Ayrshires.

ELEPHORN FARM AYRESHIRE — Choice young bulls at reasonable prices. J. H. Meyer, 440 Montgomery St., San Francisco, Calif.

AYRESHIRE — Registered; all ages. E. B. McFarland, 412 Claus Spreckels Building, San Francisco, California.

NORABEL FARM AYRESHIRE — Le Baron Estate Co., Valley Ford, Cal.

Guernseys.

EDGEMOOR FARM GUERNSEYS — First in the show ring and in official records. A few choice bred bull calves for sale. Edgemoor Farm, Santee, San Diego county, Calif.

BELLA VISTA GUERNSEYS — May Rose Governor of Chene breeding. Bull calves from high record dams. J. W. Gemmer, Ripon, Cal. R. 2.

Milking Shorthorns.

ORMONDALE RANCH — Portola Valley, San Mateo Co., Cal., the home of Golden Goods Jr., sire of Little Sweetheart, three times Grand Champion on the Pacific Coast, and Grand Champion at the International Livestock Show, Chicago, 1919. Yearling bulls and heifers for sale. James McDonnell, Supt. R. D. No. 1, Redwood City, Calif.

BREEDERS OF REGISTERED SHORTHORNS — Milk strain; choice young stock for sale. John Lynch Ranch, Box 321, Petaluma.

INNISFAIR DAIRY SHORTHORNS — Registered young bulls for sale. Alexander & Kellogg, Suisun, California.

DUAL-PURPOSE SHORTHORNS — registered and unregistered bulls. Chas. L. Weaver, Tulare, Calif.

BEEF CATTLE.

BEEF CATTLE — BULLS! BULLS! — Just returned with some splendid stock for California Beef Cattle men. Leave again for the Middle West about New Year's. Get in your orders at once for anything you need in Beef Cattle. R. M. Dunlap, Hotel Land, Sacramento, or Savoy Hotel, Kansas City, Missouri.

RANCHO SAN JULIAN SHORTHORNS — Purebred range bulls, unregistered, for sale. Estate Thos. B. Dibblee, Santa Barbara, or Lompoc, Calif., John Troup, Supt.

ALAMO HERD REGISTERED HEREFORDS (founded by Governor Sparks). Herd and range bulls. Reasonable prices. W. D. Duke, Gazelle, Siskiyou county, California.

REGISTERED MILK AND BEEF SHORTHORNS, bulls and heifers for sale; catalogue free. Thomas Harrison, Santa Rosa Stock Farm, Santa Rosa, California.

HEREFORDS — Sierra Vista Herd, Minturn, California. Over one hundred registered animals. Fairfax and Repeater bulls head the herd. On highway.

THE NEVADA HEREFORD RANCH, Jno. H. Cazier & Son Co., Prop., Wells, Nevada. Registered Hereford cattle. Breeding stock for sale.

REGISTERED HEREFORDS — H. H. Gable, Diamond G Ranch, Esparto, California.

SIMON NEWMAN CO., breeders of Registered Hereford, Newman, California.

HEREFORDS — Mission Hereford farm, J. A. Bunting, Prop., Mission San Jose, Cal.

GEORGE CALLAHAN, breeder of registered Herefords, Milton, California.

REGISTERED SHORTHORNS — Fair Oaks Ranch, Willits, Calif.

GEORGE WATTERSON — Breeder Registered Herefords. Bishop, California.

SHORTHORNS — Carruthers Farms, Live Oak, California.

SHEEP AND GOATS.

F. A. MECHAM ESTATE, Petaluma, Cal. — Breeders and importers of Shropshire, Rambouillet and American Merinos, both sexes. Also Red Polled cattle. Take electric car at Petaluma or Santa Rosa for Live Oak Ranch.

DORSETS AND ROMNEYS — Dorset ram lambs for sale. John E. Marble, South Pasadena, California.

BULLARD BROS., Woodland, Calif. Breeders and importers of Rambouillet sheep.

KAUPKE BROS., WOODLAND, CALIF. — Breeders and importers of Hampshire sheep.

CHAS. KIMBLE — Breeder and importer of Rambouillet. Hanford, California.

CALLA GROVE FARM, MANTECA, CALIF. — Breeders and importers of Hampshire sheep.

HARVEY S. VAN VLEAR, Lodi, Cal. — Breeder of registered Hampshire sheep.

MISCELLANEOUS.

BUTTE CITY RANCH

SHORTHORN CATTLE, SHROPSHIRE Sheep, Berkshire Hogs, Shetland Ponies, Bronze Turkeys, White Plymouth Rocks. Stock for sale at all times. Third sale at the Ranch — all breeds — April 17, 1920. W. P. Dwyer and W. S. Guilford, Box P, Butte City, Glenn County, California.

HORSES FOR SALE — 40 head of 3- and 4-year-old Percheron horses. Price from \$250 to \$300 for span, beautifully matched team of very kind disposition. S. L. Skaggs, four miles south of Madera, Cal.

FOR SALE — 25 head of brood sows, some of them have pigs; balance to farrow about February 1st. Also 2 fine boars. J. J. Flannery, Kifer Road, Santa Clara, Cal. Telephone S. C. 185F4.

Freeman's Heifer Fills the Bucket

(Written for Pacific Rural Press.)

She fills the bucket not only once, but day in and day out, enough times during the year to break the junior two-year-old Holstein-Friesian milk record for the State of California. On December 10th she closed her 365-day test, and while the last few days have

duction of milk for the State for 8 months after freshening, for a junior 2-year-old, and comes within two-tenths of a pound of butter of equaling the State record.

This young cow carried a calf during 7 months of the 365 days she was

Belle Faskie De Kol Witkop, 391883.
20160.5 lbs. milk, 810.286 lbs. butter in 365 days as a junior 2-year-old.

not been verified by Secretary Gardner, there will be but little variation from the figures given. Animals of such achievement in the past and promise for the future are not plentiful even in that banner dairy county, Stanislaus.

Belle Faskie De Kol Witkop produced in the yearly test just closed 20373.4 lbs. of milk and 810.286 lbs. butter. The highest seven-day record was 479.5 lbs. milk and 24.86 lbs. butter. The 30-day record is 2061.2 lbs. milk and 98.59 lbs. butter. Eight months after calving she produced 433.2 lbs. milk and 16.29 lbs. butter. This last amount is the record pro-

duction of milk for the State for 8 months after freshening, for a junior 2-year-old, and immediately afterwards will be put on test.

It is interesting to note that this heifer's junior two-year-old record exceeds that of the world's champion milk producer, Tilly Alcartra. This is certainly much to her credit.

The winnings of Belle Faskie De Kol Witkop in prizes for record production offered by the Holstein-Friesian Association amounted to over \$70 on the 7- and 30-day records, and will receive her share on the 365-day and 7-day, 8 months after freshening. She is "some" cow.

Famous Herd at Home Near Patterson

(Written for Pacific Rural Press.)

Quite a little dairy city has been built up since July on the Bridgford ranch near Patterson, in western Stanislaus county. Mr. Bridgford is well pleased with the move thither from the island in Contra Costa county, in whose isolation he has developed so many high-record cows. The Patterson district is rapidly growing, and already a great dairy country is tributary. Alfalfa produces more tonnage per acre here, and there is plenty of water. Mr. Bridgford has sold a score of registered bulls already in the Patterson district, and there are other herds that need such stock. The writer noticed fifty or sixty cows in a pasture near Crows Landing, with which were three scrub bulls of various blood. These might well have been replaced by one registered bull kept in the barnyard and used judiciously.

About 200 head are at present on the new Bridgford ranch, including 60 females carrying calves, eighteen in the test barn, and a string or two being milked in the big milking barn, which has capacity for 100 cows at once.

Dry stock are kept separate in generous paddocks and four large corrals are provided with long, broad open sheds, where the cattle will eat hay and make milk all the day long. The corrals were crowned and graveled so they were not the least muddy after the recent rain, though that soil is heavy and flat. One man will be kept busy hauling feed and milk, and keeping the corrals clean. An office, two bunk houses, a cook house, milk house, hay barns, etc., complete the

equipment, which will make a notably pleasing effect on visitors.

Some Notable Animals.

Among the notable stock in a herd where 30-pound cows are more numerous than flies, is a heifer calf recently born, sired by the \$106,000 bull, Carnation King Sylvia. Another is a young bull whose first twelve dams average 30:54 pounds of butter in a week. Another is the last year's bull calf out of the cow which won senior championship at the State Fair this year. His first twelve dams average 32.86 pounds butter in seven days. His dam, Spring Farm Pontiac Maid 2d, last year as a senior four-year-old, made 34.76 pounds butter in seven days, and 139 pounds in 30 days. Having been on the Fair circuit last Fall, and never having been dried up, no short-time test was attempted this season, but she went on yearly test about November 4, 1919. In her best seven days since then she made 34 pounds butter, and in the first 30 days her butter at 75 cents per pound was worth \$105. This was from about 3,000 pounds of milk, and she was giving 115 pounds per day at the end of that period.

One of the most massive cows of this herd of big growthy milk-manufacturers, is Adirondack Wietske Dairy Maid. After eleven months of milking, and sixty days before she was due to calve, she was giving eight gallons of milk per day. Efforts to dry her up for a rest period were begun about December 3rd. She made 304.95 pounds of butter from 7242.2 pounds of milk on a 60-day official record last year. Her seven-day record was

PRINCE ALBERT

Copyright 1919
by R. J. Reynolds
Tobacco Co.

Tippy red bags, tidy red tins, handsome pound and half pound tin humidors—and— that classy, practical pound crystal glass humidor with sponge moistener top that keeps the tobacco in such perfect condition.

PUT it right up to Prince Albert to produce for you more smoke happiness than you ever before collected! P. A.'s made to fit your smoke appetite like a glove. It has the best flavor and coolness and fragrance, ever!

Just what a whole lot of joy Prince Albert really is you want to find out the quickest way you know how! And, put it down how you could smoke P. A. for hours without tongue bite or parch. Our exclusive patented process cuts out bite and parch.

Realize what it would mean to get set with a joyus jimmy pipe, or the papers and to fill 'er up every once and a while. And, puff to beat the cards! Without a comeback!

Just as sure as you're reading this, P. A. will hand you everything you ever yearned for in tobacco joy! Why, it's so good you feel like you'd just have to eat that fragrant smoke!

From The Healthy Dairy

the milk truck always takes a full load. As soon as disease creeps in the milk yield will show it. Cows that do not milk as they should are usually suffering from a run-down condition of the vital organs of production. Medical treatment is needed to restore health and vigor.

KOW-KURE is the best known and most used medicine for treating the "poor milker." It is unfailing in the prevention or treatment of Barrenness, Abortion, Retained Afterbirth, Bunches, Scouring and Milk Fever. It should be kept wherever cows are raised for profit. KOW-KURE comes in 60c and \$1.20 packages at feed dealers' and druggists'.

Send for free treatise on cow diseases, "THE HOME COW DOCTOR". Dairy Association Co., Lyndenville, Vt.

Facts in BLACK & WHITE

Great Constitutional Vigor of Holstein Cattle

Purebred Holstein-Friesian Cattle are unequalled by any other dairy breed in health, hardiness, vitality, size and ability to consume economically large quantities of farm roughage, and transmute it into milk, butter, veal and beef. Holstein cows are the most profitable of all in milk and butter production.

Write us today for the valuable information contained in our free booklets. We cheerfully welcome correspondence.

H. CLAY GLOVER CO., Inc.,
118 West 31st Street, New York

41,016 pounds butter, and her 30-day record 158.31 from 3603.1 pounds milk. The 30- and 60-day records are the highest in the United States for combined milk and butter.

The herd sire, King Segis Alcartra Prilly, is thriving in the new quarters. He was grand champion at the State Fair in 1917, 1918, and 1919. None of his daughters have been sold from the ranch; and Mr. Bridgford, in designing his buildings at Patterson, has figured on keeping all of them for some time to come.

Easy to Keep Sanitary.

Alfalfa is to have the benefit of all the manure produced here. Aside from the overhead manure carriers the feature of this part of the ranch economy is that all drainage from the roofs, from the milk house, and from floors of the milking barn, run into a covered concrete pit six feet square and twelve feet deep. A three-inch centrifugal pump direct-connected to a three-horsepower electric motor, can empty the pit onto an alfalfa check in fifteen minutes. This pump is started automatically by a float when the sewage level comes up to the right point. It stops automatically when the pit is empty. Gravel in the corrals, yards, and driveways, and eave troughs on the buildings will reduce mud to the minimum. The milk house is connected to a steam boiler run by an oil burner, and has all necessary sanitary equipment. Add to all these reasons for contentment, the yodeling of the milker, which we heard on entering the barn unannounced, ought to make any cow happy to come to the milking, and to add other high records to the long list already made in this herd.

THE SHORT SHORTHORN SALE.

(Written for Pacific Rural Press.)

We hear it said many times that cattle, sheep, or hogs, destined for breeding purposes, should not be fitted too highly, especially those intended for the sales ring. If this be true, then reasoning negatively the Shorthorns sold in the State Fair Grounds at Sacramento, December 11th, surely ought to be good breeders if nothing else. Again, it is truly said that "an animal well fitted is half sold," therefore, following the same line of reasoning, the auctioneer had to do all the selling on the day mentioned, and right well did Col. Leachman perform his part. It can be said without question that he got all the cattle were worth; everything considered.

Col. Leachman opened the sale by introducing B. O. Cowan, former secretary of the American Shorthorn Association, who gave a brief history of this great breed of cattle in America. Prof. True, of the University Farm, Senator Rush of Suisun, and Wm. L. Carruthers of Live Oak, all gave interesting talks on the Shorthorn.

The cattle had been brought in from the range, and handled just enough to make it possible with judicious treatment to lead them through the ring. The average was \$175.70, which is not low when the condition of the cattle is taken into consideration. The top of the sale was Sweetheart II, a heifer one week over a year old, purchased by Frank McEnerney of Galt, who paid \$270 for her.

It is quite probable that if the stock, which was all young, had averaged 100 pounds heavier in weight, they would have sold for fifty to one hundred dollars per head more, which would have been a good investment even at the lowest figure.

Among the prominent Shorthorn breeders attending the sale and purchasing stock were, Thos. Harrison of Santa Rosa, H. L. & E. H. Murphy and Geo. A. Murphy of Perkins, P. R. Sims of Elk Grove, S. C. Dorn, Oroville, and Frank McEnerney of Galt. Mr. McEnerney was the heaviest buyer, having purchased 12 head by the time the sale was over, with S. C. Dorn of Oroville, a close second. Mr. Dorn bought ten, mostly of the younger animals. The total amount received for all the cattle was \$7,555.00, which for range cattle was an excellent price.

Get More Milk

Maximum milk production depends upon the ability of your cows' digestive organs to produce thorough assimilation of feed. Keep them in tip-top productive condition. With winter stabling and feeding they need help to resist disease and maintain normal milk yield. All animals need help at this time.

Dr. LeGear's Stock Powders

supply the needed laxative elements, the tonics and blood purifiers so necessary to keep your stock healthy. Insure healthy offspring, full yield from milkers; get rapid gain on packer stuff and keep work stock in first-class trim.

The Wonderful Attractions of BRITISH COLUMBIA

Few countries possess all the conditions for happy, prosperous living as does British Columbia. The varieties of climate and soil offer inducements for almost every branch of agriculture. Whether in the warm interior valleys, the rich grazing table lands or the fruitful lowlands of the Coast or Vancouver Island, the advantages offered for

Dairying, Fruit Growing and Stock Raising

are such as must appeal to those who wish to improve their circumstances and at the same time live in a country of delightful climate, magnificent scenery, varied resources, progressive people and abundance of opportunity for development. British Columbia—the playground of America—is already famous for the production of its orchards, fields and dairies. Now, is the time to learn about this wonderful Province and share in its possibilities. Its industrial life—mining, lumbering, fishing, manufacturing, transportation—assures a ready market at good prices for all the farmer can produce. Schools, churches, railways, roads, telephones, all the conveniences of an old land await you in this new Province of Opportunity and Success. For illustrated literature, maps, etc., write Department of Immigration, Ottawa, Can., or

Cement for Feed Troughs

(Written for Pacific Rural Press.)

We have heard about the Stone Age before the human race knew anything about metal implements or utensils of any kind. The Steel or Iron Age came then, and we might say, is still in existence, being used in countless ways. Now comes the Cement Age,

signed by Ruland Hardy, manager of the Anchorage Farms at Orland. They have one of this type in each of their small feed lots, and the picture shows one of the blue-ribbon Berkshires for which this establishment is noted eating from the trough.

Cement trough and feeding floor in use on Anchorage Farms, Orland.

and it might be said truthfully that it is as yet in its infancy, although it has gotten so far as to threaten the supremacy of the wooden and steel construction of sea-going ships.

On the farm, it has innumerable uses from irrigation pipe and silos in a large way to many smaller but no less useful ways. In California it is especially adapted to many uses to which it does not lend itself so readily where there is much severe freezing weather.

One of the many uses on the hog ranch, is that of feed and water troughs. The one illustrated was de-

The construction prevents the hungry hogs from throwing the feed out of the trough in front, and what is dragged out on the open side, drops on the cement floor, and may be picked up instead of being trampled into the ground and wasted.

It would seem as though it would be still better to have a cement retaining ridge around the platform instead of the wooden 2x4's which would have to be replaced from time to time.

The illustration shows so well how it is made that all that is needed is the material, and the picture, to construct a feed trough and platform exactly similar if desired.

Our Great Cattle Show

(Written for Pacific Rural Press by H. N. Barngrover, Santa Clara.)

The big Royal and International have again passed into history, but to those breeders who had the good fortune, or might I say the nerve, to attend them, the splendid lessons have not passed but have sunk deep into our minds, and we are planning to put them into practical use under our own circumstances and conditions.

One of the things a breeder learns as he watches the judge single out the tops of the wonderful classes of from 20 to 40, is that they do not come either by chance or good feeding alone, for when we look up the ancestry of the winners we are apt to find a Beau Blanchard, a Perfection Fairfax, or a Bonnie Brae, or some other noted sire in his pedigree. We need these great shows to educate and broaden us, for if the rancher and range man needs to be educated up to where he will pay good prices for good bulls, we breeders surely need to learn how to produce the really good ones, and then to show that we are actually doing it.

What better way than to attend these shows where the best cattle in the world are lined up, and learn how

they are bred, and fitted, and shown.

We made a splendid beginning at our November show at San Francisco, but it is only a beginning. We California breeders were given a most cordial welcome, and lots of encouragement at the eastern shows, and if we will only pull together, we can put up a much bigger and better show in 1920, that will convince the rancher and range man that he can afford to pay good prices for our really good bulls. The fat steer classes at Chicago were particularly strong, and since the rancher and range man's business is to produce steers, what is more convincing as to the value of good sires and good feeding than a good fat steer class?

If the new breeder will open his purse enough to attend these shows once, I am sure he will feel as I do, that it is the best kind of an investment.

California was splendidly represented by our State Farm exhibits, and did much to convince the world that we have the climate and the feed to produce the best, and all we need is the proper energy and enthusiasm.

Best "Buys" are in California

(Written for Pacific Rural Press.)

Some of the California livestock men when they go East to buy breeding animals, conclude there are just as good opportunities in California as there are there. E. K. Brown, of Miller & Lux, who is very favorably known as a stockman, attended the Chicago International looking for a Hereford bull. He tried to find what he wanted in various other places as well, but he found the top-notch animals, or those equal to California stock, were scarce and very high.

Mr. Brown finally came to the conclusion that he would buy the senior yearling bull Alec, sired by New Era II and out of Pearl Ranier, owned by J. A. Bunting of Mission San Jose. This bull was first in class at the

California State Fair this fall, and Mr. Brown concluded that at \$2250, Alec was a better "buy" for Miller & Lux than anything he could find in the East. Mr. Bunting expresses himself as very much gratified, not so much for the price obtained, but to know that we can raise stock in California fully the equal of that in the East.

For years people in the newer localities, which means western localities, have been going East for better livestock. This is all right when the locality is new and the stock breeder has grade stock, and has to let the stock "rustle" for itself largely. When, however, the new breeders have become experts, and their stock

as good or better than that raised anywhere, the need for such importations ceases to a great extent at least. Therefore, look the stock in your own

neighborhood and your own state over carefully before going "East" for what can be bought near at home at a lower price.

CAN YOU BUY BETTER POLANDS?

LOS ANGELES

PLEASED WITH PACIFIC INTERNATIONAL.

(Written for Pacific Rural Press.)

Thos. Harrison of Santa Rosa, noted breeder of Milking Shorthorns, writes that his impression of the latest Pacific International Livestock Show held at Portland, Oregon, recently was of the best, the old management and new building making a combination hard to beat anywhere. The building all under one roof left nothing to be desired in the way of convenience and comfort. Visitors, exhibitors, and animals, all were cared for in the very best manner possible.

In addition to other awards mentioned in a previous issue, Mr. Harrison's junior yearling heifer, Roan Duchess H, was made grand champion female of the breed. This heifer was placed third in her class at the California International at San Francisco.

The full awards won by Mr. Harrison's cattle at Portland were 2d on aged bull; 3d on aged cow; 1st on cow 2-year old; 3d on senior yearling heifer; 1st junior champion and grand champion on junior yearling heifer; 1st on senior heifer calf; 3d on junior heifer calf; 1st and junior champion on bull; 2d on bulls under 1-year old. This last mentioned bull calf was sold to Mr. Glass of Lewiston, Idaho. This calf was first in class at the California State Fair.

THE C. C. A. ELECTS OFFICERS

The annual meeting of the California Cattlemen's Association was held at San Francisco, Saturday, December 13th, at which the annual reports were read and work suggested for the coming year. The attendance was representative from over the state, and the discussions lively.

President L. A. Nares, who for two years has given liberally of his time to the organization and its work, stated that it would be impossible for him to carry on the work longer and asked to be relieved. F. H. Bixby of Long Beach was selected to fill his place; D. J. Stollery was re-elected secretary, and Clough was continued in office as attorney.

An effort will be made to secure a large California delegation to attend the National Live Stock Association meeting at Spokane, January 27, 28 and 29 next.

The reports made by committees show the C. C. A. to be gaining membership and influence, and the discussions on the floor during the afternoon session proved that while the members differed on the proposed national packers legislation and as to the value of the inspection under the new state hide and brand law, they had a spirit of tolerance which means the association is alive and will make its wishes effective.

FARM BUREAU AGAINST LAND BANKS.

To the Editor: An important conference was held in Chicago recently by President Howard and others of the American Farm Bureau Federation, officers of several federal co-operative land banks, and representatives of the agricultural press. It was unanimously decided to favor Senator Smoot's bill for liquidating joint stock capitalistic land banks. Unless this measure prevails promptly, prospects are that nearly all farm mortgage brokerage concerns that have exploited farmers for years will reorganize as joint stock land banks for private profit. This would submerge federal co-operative land banks to the

farmer's detriment. The Farm Bureau Federation is about to take a farmers' referendum on this subject. The conference trusts your powerful influence will be exerted in behalf of Smoot's bill.—G. A. Bryant, Eighth Federal Land Bank District.

[We are not informed as to the contents of the bill mentioned, but we chronicle the action of the American Farm Bureau Federation officers, and may have more to say about it later on.—Ed.]

NEW STATE LAND SETTLEMENT.

A tract of land in northern Merced and southern Stanislaus counties has been purchased by the State Land Settlement Board for subdivision similar to the Durham settlement except that ex-service men will be preferred applicants. Part of this will be open for settlers next spring, both for farms and for farm laborers' allotments. The rest will be opened in the fall or following spring. The size and boundaries of the various allotments have not yet been determined nor have the prices been fixed. Until these preliminaries are completed, no applications can be received. The land will be thrown open by notice to be issued early in February for 30 days' opportunity to look it over before allotting it to applicants. Every applicant should make his choice from personal inspection. Those who wish employment in preparing the land for settlers should apply to Milo Williams, engineer in charge of irrigation development with headquarters temporarily at Turlock. The chief towns in the settlement area are Delhi and Alladin.

PUREBRED BEEF CATTLE ARRIVE.

R. M. Dunlap of Sacramento, who has a habit of going East now and then, and returning with some of the best beef cattle to be found, has just gotten back from one of these trips. He brought two carloads this time of Herefords and Shorthorns.

One carload of Shorthorns was for Jerome O'Neill of Los Angeles. Mr. O'Neill expressed himself as being very much pleased with the shipment.

The Herefords were for the Parrott Investment Company, and are to be wintered at San Mateo. This part of the consignment consists of 35 young bulls. A Hereford bull was also brought out for Wm. Jones of Wheatland.

Two excellent Shorthorn cows for Richard Vurton & Son, of Vacaville, completed the list. This firm is starting a herd of which the two cows are the nucleus.

DIAMOND BAR RANCH SALE.

The swine raisers of California, and especially those interested in Duroc-Jerseys, should be sure and travel toward the south on or about the latter part of January. There will be a series of sales of this popular breed of swine at that time, and among them the Diamond Bar Ranch at Spadra will sell 40 head of females selected from their large herd.

This herd is one of the largest in the United States, and is coming to be very well known for its blue-ribbon stock, and fair treatment of its patrons. Watch our pages for further information from week to week.

CALIFORNIA DUROC-JERSEY ASSOCIATION SALE.

Nearly all the well-known breeders of Durocs in California will have a consignment in the Association sale at Davis January 14th. The breeders aim to make this a promotion sale, and in order to have it a success and influence people to start new herds, they have selected some of the best sows in their herds, and as an extra inducement bred them to their best boars. This is an opportunity not to be overlooked.

A new one on the T. M. & G. marketing force was a lot of shelled dent corn offered by one of their Turlock members recently for marketing. They did not know what price to quote.

During the season of 1918-9 there were shipped into Tulare county and inspected by the horticultural office, 879,679 pieces of nursery stock. Of these 5456 pieces were condemned because of insect pests or disease and destroyed or returned to the shipper. The most popular fruit was prunes, of which over 1800 acres were planted.

Though beet hoppers made a practical failure of what in April prom-

ised to be a fine sugar-beet crop in the Manteca district, the sugar factory is succeeding in getting growers to sign up acreage for next year. There seems reason to believe that the hoppers will not be bad here next year.

Four carloads of tepary beans were recently shipped to the poor innocent Hollanders, who bought them because they are cheap. Growers netted about 2c to 2¼ cents per pound.

Xmas and New Year's Greetings:

From FRANK P. GARDINER and SON to our friends and customers. We also wish to announce the safe arrival from Ed Kerns of Stanton, Neb., of the latest and Greatest Sensation to come to the Pacific Coast.

GREATER SENSATION

Sired by

GREAT SENSATION

Who sired World's Champion Boar at National Swine Show, 1919. Also the World's Grand Champion Boar, 1919. His get has won more prizes at the fairs and swine shows this year than any living boar.

NOTICE—To Farmers and Breeders: We will produce over a thousand High Class Durocs next year, sired and dammed by the best blood lines of the breed. Write us your wants. Satisfaction in every transaction. Prices reasonable.

GARDINER RANCH

ROUTE NO. 4, BOX 735,

SACRAMENTO, CAL.

The "W-W"

(Hammer Principle)

ALL-PURPOSE FEED GRINDER

Utilizes Waste Products that being ground with a "W-W" are Valuable Stock Foods.

Many valuable foods for stock are being wasted in California because heretofore it was impossible to convert the waste products into safe food for stock.

But with the "W-W" All Purpose feed grinder that is having such remarkable sale since introduced by us, everything of food value to stock can be saved. Many feeders have made back double or three times the small cost of a grinder in the saving on feeds and the best part of it is the "W-W" Grinder is still working and working better than any grinder or beater (this is the hammer principle), that was ever sold in California, grinding the feed so it goes farther and does the stock more good.

One user has been converting almond hulls (not long ago considered worthless), into one of the very best and most valuable ground foods for stock.

You can pulverize hay, cotton bolls, hulls, any kind of grain, fertilizer, shavings, poultry, rabbit and goat feeds into any degree of fineness.

Built in a wide range of sizes for horse and engine power. Write for information about W-W Mills and economical, efficient feeding, stating what raw material you have available and tonnage required. "W-W" grinders quickly pay for themselves.

Poultry and Rabbits for Profit

SMALL EGG PRODUCTION—WHY?

To the Editor: We have a flock of brown Leghorns, 70 two- and three-year-old hens and 60 pullets, 8 and 9 months old—130 in all. We feed 15 lbs. of Egyptian corn, one-third of the amount in the morning, the remaining two-thirds at night. This is fed in litter where the hens work for it busily early and late. They have "Surelay" (dry), before them at all times, also fresh water—and an abundance of green feed cabbage and cauliflower trimmings, lettuce, turnip tops, etc. Shell, charcoal, and grit are provided. A large number of the hens are well over the moult and combs are red. Pullets are fully developed and in good condition. They have no lice or mites. Can you tell us why we are getting only an average of 6 or 7 eggs a day? Do we feed enough? Would it be wise to add extra beef scraps to the "Surelay" mash?—R. T. M., Fresno.

The amount of grain mentioned, fifteen pounds, is approximately the correct amount for 130 hens and pullets, but as it is not stated how much mash these fowls eat per day we cannot tell whether they are receiving a balanced ration for egg production. To secure this balance they should consume about an equal number of pounds of mash and grains. If the fowls do not willingly eat an equal amount of mash, feed a smaller amount of grain until they realize that they must do so or go hungry. Frequently they go out on a hunger strike under such treatment but accept the proper diet within two or three days. The partial fast often does them good. The greens mentioned are good if fresh, and if fed regularly will not throw the ration out of balance no matter how much they may eat. However, cabbage leaves, when they become stale and wilted develop a peculiar acid, and when fed to laying hens or pullets will cause them to stop laying. At times it requires weeks and even months to bring them back to full lay after they have been affected by this acid. It would be a safe and economical experiment to add a moderate amount of meat scrap to the mash.

FATTENING TURKEYS.

To the Editor: We have about 60 young turkey hens and gobblers, weighing from 7 to 12 lbs. now. Would like to get them good and fat for Christmas market. Would you kindly tell us what feed would fatten them the quickest? Is it better to shut them in a barn or to let them run in a yard with plenty of green feed?—Geo. L. T., Chowchilla, Cal.

Turkeys fatten quickly when properly fed a liberal supply of almost any sort of sound grain. Some feeders claim that maize, the common Indian corn, is best, while others seem to be equally as successful with a mixture of grains, including barley, Egyptian corn, milo, etc. The feeding of whole or skim milk—sweet, sour, or as butter milk—adds to the attractiveness, flavor, and texture of the flesh. Turkeys that are fattened for market should not be permitted to exercise to excess. Some feeders confine them to very restricted quarters while finishing them for market, but others allow limited range and encourage them to exercise moderately. To prevent them from wandering they feed grain several times a day at regular intervals. Only the amount of grain that they will eat up clean should be fed at any time. Never allow any excess grain to remain to be picked up between meals.

TURKEYS MOPE AND DIE.

To the Editor: My turkeys suddenly become inactive and mope around; sometimes they will eat up to the last minute and again they won't eat for a couple of days, more or less, before dying. They always have a diarrhoea. I opened up some of them and found they all had their liver enlarged to

more than twice the natural size and covered with yellow spots. What is the trouble and treatment?—M. A. P., Soledad.

There are several diseases of turkeys that seriously affect the liver and cause it to be spotted, but apparently these turkeys have contracted the disease known as "blackhead." There are no peculiar external symptoms of this disease except the dark color of head and comb. Turkeys suffering from this disease always have a severe diarrhoea, the liver is greatly enlarged, and is marked with whitish or yellowish spots. Blackhead is a contagious disease and it is believed by some investigators to be caused by the same organism that is responsible for white diarrhoea in chicks. It is supposed that the infection is often carried into healthy flocks by sparrows, crows, and other wild birds, as well as chickens that are carriers of the disease germs, but may not be seriously affected themselves. Treatment of turkeys that have become seriously affected is of little use, but those that do not seem to be very ill

may be helped by giving Epsom salts or castor oil every three or four days. Remove such birds from the flock for treatment. Sprinkle the premises with air-slaked or ground lime. Move all well birds to fresh ground as often as possible and burn all dead fowls. The object is to prevent the spread of the infection, which is the only practical way to combat the disease. Do not allow turkeys to dwell with other fowls.

PROBABLY DISTEMPER.

To the Editor: My little turkeys are sick with a sore mouth. White blisters form under the tongue and sores on the corner of their mouths, and sometimes the eyes get sore but do not swell, but just stick shut. Have not found anything to stop the disease or cure it. What can I do?—E. E. A., Snelling.

The age of the little turkeys is not stated but evidently they are very young and consequently did not during their early growth enjoy the advantages of natural spring conditions which provide some insects, grass and other bulky and not over-rich vegetation to fill the crop, cool the blood, and provide material for normal development. To successfully raise early

fall-hatched fowls of any sort the feeder must, in a great measure, supply artificial spring conditions. We think these little turkeys are suffering from a distemper that is the result of improper feed. Very likely they have had too much grain and other concentrated feed and could not obtain the necessary bulky materials that contain relatively little nourishment, but provide many little elements required for young growth and at the same time distend the crop thus exciting the flow of digestive juices necessary for healthy digestion. Medicine is of little value in remedying a case of this kind unless the cause of the disease is promptly removed. We suggest two or three doses of Epsom salts administered three or four days apart. This will tend to cool the blood and cleanse it of the unassimilated food. For a week or longer feed no grain or other concentrated feed. Supply as great a variety of greens and vegetables as possible. Buttermilk or sour milk would be excellent. Be sure they have a constant supply of grit, shells, charcoal, and ground bone.

Some breeders put a well-bred, strong, vigorous cockerel with twenty yearling hens, when mating Leghorns. That number is none too large.

"Buy Firestones"

That's the Word
That's Going
Round This
Year

WHEREVER you go you hear car owners passing the word—"Buy Firestones. They're the best cords this year." The reasons are many, but the conclusion is the same—Buy Firestone Cords.

Read these spoken advertisements for the New Standard Oversize Firestone Cord with Extra Heavy Non-Skid Tread:

"It gives me a lot more service than the mere guarantee."
"Not only fine service but a tire that looks right."

"The extra air gives easier riding."

"The non-skid tread is fine; it holds in all kinds of roads and yet there's no power wasted."

"I bought it because of its extra size and the Firestone reputation."

"You'll notice that you go farther on a gallon of gas."

"It steers easy and grips the road."

With the mouth-to-mouth tire advertising centered on Firestone this year no thinking tire buyer can afford to remain uninfluenced. See your dealer.

HOLLISTER HATCHERY—Day-old chicks of quality from selected stock. White Leghorn, Black Minorca and Plymouth Rocks. We guarantee safe delivery. Free circular and price list. Box 693, Hollister, Cal.

MODEL POULTRY FARM—White Leghorn specialists—our fifteenth year. Baby chicks and hatching eggs for sale. Also first-class breeding cockerels and cocks. W. C. Smith, Prop., Corning, Cal.

RED CARNEAUX for sale. I have about 50 pair of splendidly bred and mated working birds at a reasonable price. For particulars address Alfred Lindsley, care Humboldt Times, Eureka, Cal.

BABY CHIX—Hatched from our own stock in our hatchery. Hens are of S. C. White Leghorn Utility stock, bred for commercial laying. E. A. George, Petaluma, Cal., R. D. 2, No. 29.

HART'S BRONZE TURKEYS—Large, vigorous young stock of both sexes for sale; also year-old hens. Eggs in season by the setting or hundred. Albert M. Hart, Clements, Cal.

FOR SALE—White Holland Turkeys, S. C. Rhode Island Red cockerels, Guinea roosters. One Golden Seabright cockerel. Send stamp. E. A. McKinley, R. D., Ukiah, Cal.

BARRED PLYMOUTH ROCKS—Nothing better in poultry. Prize-winners and wonderful layers. Choice stock for sale. Chas. H. Voden, Box 3, Los Gatos, Calif.

WHITE LEGHORN BABY CHICKS—Fertile and Tanager strains. Circular free. Henry Tarratt, Corning, Cal.

FOR WHITE HOLLAND TURKEYS write J. L. Fulton, Glenn, Calif.

MOVING YOUNG TURKEYS.

To the Editor: I have a ranch in the San Antonio valley back of Mt. Hamilton. I want to raise about one hundred turkeys on my place this coming year, but cannot go back there to live until April or May. Can I hatch out my turkeys here and when they are about two months old take them over there and turn them loose on the range? Would the different climatic conditions set them back or kill them? At what age would it be safe to move them?—R. F. S., San Jose.

Experienced turkey raisers successfully move young turkeys to distant points, even when they are as young as a week or less, therefore our correspondent should be able to move his eight-week-old youngsters with little or no danger. The change of climate from San Jose to San Antonio Valley during late April or May is not a serious matter, but they must not be packed so closely in the moving crates as to cause them to sweat and take cold when released at destination. However, the statement "turn them loose on the range," may indicate that it is contemplated, when moved, to allow them to shift for themselves. In that case all or nearly all of them may quickly die from several possible causes; this might occur even if they were four or six months of age when moved. At or before the time they are moved proper quarters should be provided to protect them and afford a means of control by the keeper. Some feed must be supplied in addition to what they may find on the range at that season. One of the chief causes of death loss by mountain turkey-keepers is depredations of wild animals. This is a matter to be seriously considered in advance of the change of location.

BALANCED RATIONS.

To the Editor: I am feeding feterita (in the head) and Sperry's Surelay mash (dry), with plenty of green feed, to my hens. What would make

FOR SALE—Baby chicks from good Hoganized S. C. White Leghorn stock, from D. W. Young and Tom Barron strains; \$15 per 100. 25% with order, balance C. O. D. Heavy breeds, 20c each. Custom hatching; capacity 15,000 eggs; set eggs every Wednesday; deliver chicks every Thursday. H. K. Biddle, Poultry Ranch and Hatchery, Aromas, Cal.

PRUSSIAN HILL POULTRY RANCH—Blue Andalusian Cockerels, extra fine, February hatch, \$5.00; Barred Rock and B. Minorca Cockerels, late March hatch, \$4.00. Hatching eggs, after December 20th—Andalusians, Rocks and Minorcas—at \$2.00 for 15 eggs. Order early. Geo. I. Wright, Mokelumne Hill, Cal.

PEERLESS WHITE WYANDOTTES—Our 200-egg strain, bred for years for show qualities and high egg production. 50 cockerels, 100 pullets for sale. Trios and mated yards. Eggs for hatching. Catalogue free. J. W. Atkinson, Box 8, 130 Willard St., San Jose, California.

PIT GAME FOWLS—Tested brood cocks, tested brood hens and tested brood stags; also have select fighting cocks and stags. Send 2c stamp for catalogue. Agee S. Broughton, Perdue Hill, Alabama.

THE TRAPNEST is the only way in telling your layers. Our stock is all trapnested. Come and see them. Single-Comb White Leghorns only. Columbian Poultry Ranch, Sunnyvale, Calif.

EARLY BABY CHICKS beginning with the first week in January. Will book orders for all through the season. Santa Clara Valley Hatchery, San Jose. Jos. A. Bihn, Prop.

PUREBRED CHICKS from selected bred-to-lay S. C. W. Leghorns, Barred Rocks, R. I. Reds. Order now for February-March delivery. Maxwell Hatchery, Madera, Cal.

"EASTMAN'S BRED-TO-LAY" Hoganized and trapnested Barred Plymouth Rocks. Eggs; cockerels, January chicks. Fairmead Poultry Farm, Fairmead, Cal.

LARGE BRONZE TURKEYS FOR BREEDING—Toms, \$8.00; hens, \$6.00. Order at once, stock limited. Address Chas. Dunlap, Box 31, Yreka, Cal.

FOR SALE—Large Bronze Turkey Toms from good laying hens. Also baby chicks. M. H. Taylor, Box 219, Ceres, Cal.

BUFF ORPINGTONS, BUFF DUCKS, BOURBON RED TURKEYS—The Ferris Ranch, Rt. 2, Box 144D, Pomona, California.

WHITE HOLLAND TURKEYS—A few choice purebred hens and toms. Earl V. Smith, Loma Vista Ranch, Willows, Calif.

MAMMOTH BRONZE TURKEYS, Embden Geese and Collie Dogs for herding purposes. John G. Mee, St. Helena, Cal.

BABY CHICKS—(Thoroughbred White Leghorns). No weak ones charged for. Schellville Hatchery, Schellville, Cal.

BRONZE TURKEYS AND EGGS—Limited number of breeders. Eggs by settings, hundred or thousands. M. M. Reiman, Planada, Cal.

BOURBON RED TURKEYS—M. Geo. F. Smith, Hardwick, Cal.

a better balanced ration?—B. E. S., Roseville.

An equal amount of grain and mash usually provides a balanced ration for egg production when the fowls are supplied with an abundance of greens. However, our correspondent will find that several kinds of grains will produce better results than any one sort. Fowls soon tire of one kind of grain; with several kinds before them they are certain to eat more feed and the

more feed they eat, if it is properly balanced, the more eggs they are able to lay.

THE Pride of Petaluma Brooder Stove

TRIPLE VENTILATION AND COMPOUND RADIATION FEATURES

Notice the three separate series of fresh air diffused from the ventilating shaft. They force the heat from the radiators and SWEEP the room out with fresh air, properly diffused and blended with just the right heat. IT VENTILATES IN SPITE OF THE OPERATOR.

NOTICE this stove has TWO RADIATORS. The top radiator is very large and uses the heat the second time, giving full benefit of great volume of heat that is WASTED with any SINGLE RADIATOR stove. Do your own reasoning. Our customers say we use half the fuel of any other brooder stove.

NOTICE the top radiator being very large, acts as a cone deflector to the lower radiator.

Our LATE AUTOMATIC regulator is the best and most accurate ever made.

This TRIPLE ventilator is working WONDERS everywhere and PETALUMA is discarding perfectly good 1919 brooder stoves for this Model. There must be a reason. Burns any OIL from FUEL OIL up and uses less than any other stove. TRY ONE. KEEP IT IF YOU WANT IT. RETURN IT IF YOU DO NOT. NO 43 ILLUSTRATED CATALOGUE FREE.

Kresky Brooder Stove Co.
PETALUMA, CALIF.

50,000 Dressed Turkeys Wanted FOR CASH!

Below you will find one of many unsolicited testimonials we have received since Thanksgiving.

Bangor, Cal., Dec. 2, 1919.

W. C. PRICE & CO.,
San Francisco, Cal.

We have your favor of November 27th, enclosing check for our shipment of Dressed Turkeys for \$699.90, for which accept our thanks. Am well satisfied with sale.

Will do business with you other years. If I should see any one that has turkeys for sale or anything else, will recommend your firm to them.

Yours truly, T. C. BEDELL.

We sold Fancy Dressed Turkeys as high as 55 CENTS PER POUND during Thanksgiving week, and we expect them to sell as high during Christmas week. Ship us all you can. Mark and consign all your shipments of produce to the old and reliable firm of

The Home Circle

"GOD'S IN HIS HEAVEN" STILL.

Lonella C. Poole.

O troubled hearts, forget your pain,
Your grief and loss, now once again
The merry Yule-tide brings
Its joy of giving, song and mirth
To gladden all the hearts of earth,
And once more celebrate the birth
Of our great King of Kings!

Come, little birds and friendly beasts,
And share with us the Yule-tide feasts
Earth spreads so lavishly!
O children, let your voices gay
Banish all gloom and doubt away!
Be wholly happy for this Day,
And dance around the Tree!

Ring, Christmas bells! Your message gives
Faith to believe that Truth still lives!
Ring, ring, with right good will!
For though humanity's bruised breast
Is throbbing with a wild unrest,
Man longs and strives yet for the best!
God's in His Heaven still!

A GLAD CHRISTMAS.

All day long, sitting by Sanaretta's washtub, Olio D'Antignac mused upon his Santa. As he pondered, he spoke to imaginary audiences, telling all his thoughts, gesticulating with his long, bony, loose-hung arms and legs, for he was a blind boy, not yet 10 years of age.

His people, once upon a time, had been actors and possessed genius; but that mattered not, it seemed, in his destiny, for so very poor had his mother and himself become that the tragedies, the hopes and fears of a lifetime seemed to form the little bundle that beat where his heart was.

And yet there were long hours when he was most unhappy, thinking of his mother, with her hacking cough.

The winter was so severe, and Sanaretta's cough had grown so much worse, that just before Christmas Olio despaired of her ever being able to earn any more food. Finally he went with his mother from house to house, begging everyone to help find him a home. While Sanaretta was going from house to house to do the washings, Olio had the privilege of eating one square meal a day with his mother; but now that she was growing so much worse, they despaired of even that.

Oh, if he were only a man and could work for his mother! He could only think—and pray to his Santa!

He had almost given up, when the professor of a small college on the beautiful hills overlooking the village sent for his mother one day in haste to come to his home, and while she washed, keep his children for the day, so that he and his wife might go to a nearby city to meet his old college friend and chum, a very great medical man.

The thought came to Olio like an inspiration: The professor was one man so far above their own station in life that they had never even thought to appeal to him to find himself a home. He would make a last effort, he determined.

All day long Olio had imaginary games with the laughing, romping, mischievous children, although they really played with him scarcely at all—only the baby.

Once, just as they were leaving, they heard the baby ask Olio to tell her a story of Santa, and the children paused to listen. Before Olio could even begin his story the other children began, telling, all at once, what they wanted Santa to bring them. The long list of things they named made Olio's heart beat faster. But at last they were through, and the room grew still for a long moment when they asked Olio what he wanted Santa to bring him.

Now Olio could scarcely answer a question without telling a tale of something that really happened when

he was in Old Mexico, for his life had been some better there.

"When I was in Mexico," he began, "they told me if I would write on a piece of paper the things I wanted Santa to bring, and send it through the fire up the chimney, Santa would surely bring it. And I did write, and when Christmas came and I found that Santa forgot me, I sat on the doorstep and cried all day—for mother was away washing. After a time an old tramp came by and he sat down on the step by me and we told our troubles. He asked me how I sent my letter to Santa. When I told him he laughed a big laugh and then he told me how to find him sure enough, and since that he has always brought me what I asked for."

"What did the tramp tell you?" the children cried.

"Why, that old tramp said—what do you suppose he said?" Olio suddenly gasped, protruding his long neck, with his questioning chin in the air.

"What?" the children laughed.

"He said," Olio went on, "that I should have the real Santa, not that sort of a Santa. He said that when the real Santa was born, men went so wild with joy that they dressed

Now there was a corner in the wash room, forbidden to the children, just because the cistern pump was broken. Even the professor had that morning cautioned the children to keep away from that corner, and it was one of those commands children instinctively obey.

But it is easy for babies to forget.

In another moment the golden-haired baby darted through the wash room, past Olio, into the forbidden corner to hide.

His heart stood still. He was afraid to try to go to her, or to call the others for fear of frightening her. At last he cried: "Come back, baby girl, or you will fall in the well!" Ere his voice died he heard a splash and the baby's scream.

Olio rose quickly, groping his way to the open cistern. As he did so he called loudly to his mother, telling her what had happened. The mother did not answer. It seemed to Olio now, as the thought flashed through his mind, that she had been gone a long time to hang out that handful of clothes.

Olio was just able to reach the child by stretching his long arm to its fullest and leaning into the well himself, but he was afraid to attempt

Little waves of delight danced over his snug, comfortable body.

He heard the baby's laugh. Its mother crooned softly, close by. He rejoiced when he heard her exclaim: "Yes, baby's cold will soon be well!"

His own mother's familiar cough smote upon his half-awakened ear, with a not unpleasant sound. It was followed by the professor's voice in a comfortable, reassuring tone:

"You need not worry about your son having a home, for if Dr. Ford's plans fail, we'll adopt your boy and give him a home. Madam, Dr. Ford here, is an old college friend, a medical man of repute, who is spending the Christmas vacation this year with me. He came with me from the city yesterday. He has examined the boy's eyes and he considers his blindness due to ignorance and neglect of the cause of his trouble, and he says—"

"Oh, what does he say?" Olio demanded, sitting up in bed.

"I am Dr. Ford, son," came in strange voice to Olio, as a big hand patted his head. "Next Christmas you will see as well as I can."

"But, doctor, I want to see my mother's face for once before she must die!" Olio pleaded.

The doctor walked once more to the bed: "Now, my son, if your mother dies, it will be a death from neglect. Her trouble is only a bronchial affection, which may be cured speedily."

"And," broke in the professor, "my wife and I want to always look out for you both!"

"You see, mother, I told you the real Santa Jesus never forgets!"—By Betty Bush-Winger.

WHEN IS A PERSON OF AGE?

A statement as to when a man becomes of legal age is printed in an Eastern farm journal, which seems curious and interesting. Claiming to be the law as well as court rulings, the following is the quotation as printed:

"The rule is well established by the English and American Courts that a person is twenty-one years of age on the first moment of the day preceding the 21st anniversary of his birth. As the Delaware Court has said:—

"A person becomes of age on the first instant on the last day of the 21st year next before the anniversary of his birth; thus, if a person were born at any hour on the 1st of January, 1801, even a few minutes before twelve o'clock of the night of that day, he would be of full age at the first instant of the 31st of December, 1821, although nearly forty-eight hours before he had actually attained the full age of twenty-one, according to years, days, hours and minutes; because there is not in law in this respect any fraction of a day; and it is the same whether a thing is done upon one moment of the day or another."

MARSHMALLOW GINGERBREAD.

One egg well beaten, 1 cup sugar, ½ cup molasses, ½ cup milk, ½ cup melted shortening, 2 cups flour, 2 teaspoons ginger, 1 teaspoon cinnamon, 1 teaspoon salt, 1 teaspoon soda.

Sift dry ingredients. Beat egg, add sugar, molasses and milk and add gradually dry materials; mix well, add melted shortening, and pour into a well-greased baking pan and bake in a moderate oven. When cooked, place about eight marshmallows on top of the gingerbread; return to the oven until melted.

SHE KNEW.

Marjorie has attained to the dignity of the kindergarten. A few days ago she proclaimed proudly at the dinner-table, "I know how much two and two make, and free and two, and four and two." "And what," said her father, "do you and I make, Marjey?" With out a moments hesitation, the little maid answered, with a dimple and a smile, "Sweethearts." And all the family were satisfied with Marjey's arithmetic. New Orleans Picayune.

THE CHRISTMAS MESSAGE.

CHRISTMAS TIME, the one time of all others universally given up to mirth and innocent joy, ought not to be darkened by the contrasts that pain us continually throughout the year. It seems as if there were no place for any but happy people at a season when love and good wishes overflow to all mankind. The churches, the stores, the good-natured crowds that throng the streets, the eager children, busy with their planning and their delightful mysteries—all seem involuntarily to hint of the time when the dream of a universal brotherhood shall work itself out at last in the lives of men.

But we are not all happy. For some of us, the outward form of all that made Christmas dear and fair, is covered with the ground. Many of us have had our hearts so torn by the suffering of dear ones that it seems wicked to be happy.

The Christmas meaning, though rightfully expressed by merriment and gifts and unusual generosity, nevertheless lies far deeper than these. Its revelations are not alone for the young or the happy. Our hearts may ache, but the Christmas message comes to bid us live for the peace that is in the heart. The Christmas message is more than one of temporary good will to men and partial peace on earth; and the Christ child may be born in our hearts again in new purpose, new hope and new aspiration.

themselves up like a Santa Claus and went everywhere ringing bells and giving candy and toys to all the children. He said that sort of thing was all very well for rich children, but poor, little ragged kids like me had better not trust too much in the Santa Claus men; but that they must tell the real, sure enough Santa Jesus in heaven when they want things. He said the other Santa was an imaginary plaything, while my Santa was real.

"Sittin' there on the door step, with the snow all meltin' round us and making mud puddles, the old tramp taught me how to pray to the real Santa Jesus, and then he went on limping down the alley."

The children were growing impatient. They looked upon Olio as a foolish dreamer. "Well, what did you ask him for this time?" they demanded.

"I have asked him to send me a home this Christmas—a real, sure enough, good home, where I may stay when mother goes away," he half whispered.

Soon Sanaretta went out into the snow to hang out the steaming clothes in the icy air. Still Olio dreamed.

lifting her out. The opening in the floor was a large one and he was barely able to maintain his hold by keeping his body taut at full length upon the floor. Besides he was weaker than most boys of his age.

The clock struck five. He was tempted to drop the child, but he only fastened his fingers tighter in a death-like grip.

Straightway he caught the words: "Mother! Father!" in the children's voices and knew that the professor and his wife had returned. The door opened and he heard them running frantically to the cistern.

Then stars danced before Olio's eyes, and he sank into a dizzy blackness where there was a familiar swish-swash of water, followed by a cooing, baby voice, and the feel of wet hands caressing his cheeks.

After a time he again grew conscious of voices. Yes, it was surely the professor's children in an adjoining room telling what Santa had brought them; and he felt, rather than saw, the big Christmas tree, with its load of toys they talked about.

He had been asleep, and he lay now in a warm room on a soft bed.

It was Christmas morning!

SPIRITUAL LIFE.

To have courage without pugnacity.
To have conviction without bigotry.
To have charity without condescension.
To have faith without credulity.
To have love of humanity without mere sentimentality.
To have meekness with power.

—Charles E. Hughes.

"SKINNY" FOLKS. LONGEST LIVED.

In an address delivered at Chicago last week before the American Institute of Actuaries H. W. Butholph, Indianapolis, who has devoted years to the study of the statistics of life insurance companies, made these observations:

That thin persons live longer than fat persons.

That being underweight is not nearly as just a cause for alarm as being overweight.

That the moderate use of alcoholic beverages is not likely to lessen a person's life span.

That the high nervous strain under which Americans live has not increased this country's death rate compared with that of Great Britain.

That farmers live longer than persons who reside in cities.

That the Middle West is the most healthful locality of the United States in which to live.

That the extreme South is the most unhealthful section of the United States in which to live.

That negroes have a much heavier mortality than either the whites or the American Indian.

That one-tenth of all insured persons' deaths are due to accident, suicide or murder.

He said that the Government war risk plan adopted for the soldiers during the war had increased the business of private life insurance companies, who are at present enjoying the most profitable year in the history of the business in this country.

EASY-AND-OFTEN HOUSE CLEANING.

Keeping the dirt out of the house as far as possible is the first step in simplifying house cleaning. It is easier to keep walks, steps, porches, and sills clean than to remove the dirt from rugs and floors after it has been tracked inside the house. Clean shoes and rubbers mean less dirt for the housekeeper to combat.

When cleaning, remove the dust thoroughly. Right methods mean removing, not scattering the dust about to settle again.

Do the heavy cleaning a little at a time and avoid the spring and fall house cleaning.

Use water and cleaning agents sparingly. Too much of either injures wood and all finishes as well as weakening glue, paste, and cement. Always rub until dry the surface which has been dampened.

Train the family to leave things in place and in good condition. Good habits are worth cultivating, and this one also simplifies the work of the housekeeper.

BUTTERSCOTCH RICE PUDDING.

Wash thoroughly and drain 1 scant cup of rice. Boil until cooked, then set on back of stove until all water has evaporated. Beat well one egg, add to rice and then add one pint of milk and sweeten slightly. Add the following butterscotch mixture: Boil together ½ cup water and 1 full cup brown sugar, adding piece of butter size of walnut. Boil until a slightly thick syrup is formed. Add teaspoon vanilla and mix this syrup thoroughly into the rice. Serve when cool. The flavor is better than if eaten warm.

KEEPING APPLE CIDER SWEET.

Fill fruit jars with the fresh apple cider. Add a tablespoonful of sugar to each quart. Place rubber and cap in position, partially tighten, or cap and tip the tin cans. Sterilize in hot-water bath outfit for 10 minutes; in water-seal outfit for 8 minutes; in the steam-pressure outfit, under 5 pounds

of steam, for 4 minutes; in the aluminum pressure cooker for 2 minutes. Remove jars, tighten cover, invert to cool, and test joint.

Note—If you desire the apple cider to be a little tart or slightly fermented, it will be necessary to let it stand for two or three days before you sterilize, and then add about two minutes of time to each schedule given in the recipe.—From U. S. Extension and Home Economics.

COMMUNITY WELFARE LEAGUE.

The people of Escalon, San Joaquin County, are alive to the fact that successful living means more than just money-getting and money-saving, important as these may be.

Realizing the need of keeping the young people's interest in the home community, they have started a movement for the organization of a community welfare league. A number of preliminary meetings have been held to bring forth discussion of plans.

It is the purpose to provide amusements of various kinds and to use all possible efforts to promote the social welfare of the community.

CLAM OR OYSTER COCKTAILS.

Clams and oysters for cocktails should be small, fresh and very cold. Chop a sweet red pepper very fine, add to one cup of tomato catsup or tomato sauce, and a dash of Tabasco sauce, if desired, a few drops of Worcestershire sauce, and a dash of Tabasco sauce, if liked highly seasoned. If preferred, a cocktail mixture may be purchased at any grocery store to which the oysters may be added just before serving. Serve in wine or cocktail glasses or in green pepper cups.

CALIFORNIA EGG-LAYING CONTEST.

Report for Week Ending Dec. 7th, 1919.

Leading pens to date:

W. J. Neff, Santa Cruz, W. Leghorns, 111 eggs.

W. Wood, Santa Cruz, W. Leghorns, 97 eggs.

C. K. Hale, Santa Cruz, W. Leghorns, 91 eggs.

S. L. Gibson, Santa Cruz, W. Leghorns, 91 eggs.

C. T. Brown, Santa Cruz, W. Leghorns, 90 eggs.

Leading Individuals to date:

D. B. Walls, Petaluma, W. Leghorn hen No. 16, 17 eggs.

D. B. Walls, Petaluma, W. Leghorn hen No. 18, 16 eggs.

Leading pens for week:

W. T. Neff, Santa Cruz, W. Leghorns, 42 eggs.

D. B. Walls, Petaluma, W. Leghorns, 34 eggs.

S. L. Gibson, Santa Cruz, W. Leghorns, 32 eggs.

W. Wood, Santa Cruz, W. Leghorns, 32 eggs.

High hens for week:

D. B. Walls, Petaluma, W. Leghorn hen No. 16, 6 eggs.

D. B. Walls, Petaluma, W. Leghorn hen No. 18, 6 eggs.

Bellow Bros., Lakeside, W. Leghorn hen No. 30, 6 eggs.

W. J. Neff, Santa Cruz, W. Leghorn hen No. 285, 6 eggs.

Chas. Lehman, Santa Cruz, W. Leghorn hen No. 363, 6 eggs.

The farm bureau of El Dorado county has organized a poultry department with branches in most of the centers.

THE BIRD FAMILY.

A minister's wife has been married three times. Her maiden name was Partridge, her first husband was named Robins, her second husband Sparrow, the present Quail. There are now two young Robins, one Sparrow and three Quails in the family.

One grandfather was a Swan and another a Jay, but he passed away and so he has become a Bird of Paradise. They live on the Canary Islands, "and," comments a newspaper on the above, "the name of the fellow who wrote this is Lyre and he is a relative of the family."

WATCH THE ADS.

How many of the women readers of the "Press" are noticing the advertisements of home fixtures and appliances from week to week? An investigation will often bring a saving of time, money and labor.

"EQUAL RIGHTS."

Janet came in with a startling philosophy of life. She said: "Mama, Joe told Betty he would fight all her battles for her. Just told her when she got into trouble he'd do the fighting."

"Well, Joe is a very gallant little boy, isn't he?"

"Gallant! Joe's selfish. Don't you suppose Betty would like to do a little of her own fighting? Joe wants to do it all."

APRICOT ROLL.

Take twelve ounces of flour, one-half ounce of sugar, one-half ounce of butter, one-half pint of warm milk, four ounces of apricots (if dried, soak over night) one ounce of salt and one ounce of yeast.

Mix the sugar, salt and butter in a bowl, then add the warm milk in which yeast has been dissolved. Finally add the flour and make into a smooth dough. Allow to rise for one hour, then cut the dough in pieces of one ounce each. Roll a few apricots on each and let raise for a half-hour more. Put in a pan, wash with egg, and bake for fifteen minutes.

DREADNAUGHT
BLAZING-AWAY-IN-COST-DEFENCE!

1920 RESOLUTIONS

Your first, one and the most important, should be the Heat Problem—start the new year right—make everybody happy. Turn the cookstove or heater into a real Gas Stove.

Remember, there is a big difference between Oil-Gas from kerosene that is properly matured, dry and clean, and the usual wet vapor that is a carbon maker, dirty and expensive.

Study the lines of the Dreadnaught Burner. Give the subject a little thought and you will understand why we talk about the "straight lift of the gas" and the little square block—it's the drying process that perfects the gas. This is a vital point usually lost sight of in Burner construction. Let us give you further details—write for our circular; it will be mailed promptly.

CHRISTMAS CANDIES.

The cream candies of the confectioner often seem beyond the skill of the housekeeper, but if directions are carefully followed, the results may be most successful. Fondant is the basis for cream candies and to make, take 4 cups of granulated sugar, $\frac{1}{2}$ teaspoon cream tartar and 2 cups boiling water. Put the sugar and cream of tartar in a saucepan, add the boiling water and stir until sugar is dissolved. The mixture should be stirred slowly from the center of the pan in order to avoid having grains of sugar gather on the sides of the saucepan. The saucepan must be kept free from sugar or the fondant will become "grainy."

Cover the kettle until boiling point is reached, then remove cover and cook until the syrup will form a soft ball when dropped in cold water. This takes about ten minutes. When cooked, remove from fire at once and set aside to cool in the pan it was cooked in.

It is important that the syrup should cool evenly, therefore do not pour out into a dish, nor set the pan in cold water.

When cool, stir vigorously with a wooden spoon until the syrup has changed to a white, creamy, glossy paste. When too stiff to stir, turn out and knead on a board until light and creamy. Then place in an earthen bowl or jar, cover with a damp cloth and put away for 24 hours.

If, in spite of care, the fondant becomes grainy or sugary after it has been stirred, put back into the saucepan with additional hot water; stir until the sugar is dissolved, cover the pan and cook to the soft ball stage again.

After the fondant has set for 24 hours, it may be made into a variety of candies. For walnut creams, flavor fondant; take off pieces the size of a small walnut, roll into balls in the palms of the hands, and press a walnut meat on each side.

For chocolate creams, make balls of the fondant as described above, then set aside to dry for an hour. Melt unsweetened chocolate and roll each ball in it, using a hat pin to move them about and lift them out. Each candy should be placed on waxed paper to dry.

The fondant may be used as a covering for candied fruits or any nut meats. To do this, melt the fondant over hot water, flavor, and roll the nuts over in it, placing on waxed paper to dry.

To color fondant, add the color by dipping a toothpick into the color and mixing with the fondant. It takes very little to make a delicate shade. Flavorings should be added by the drop to avoid thinning the fondant too much.

Cocoanut bars or balls may be made by adding cocoanut to the fondant; in fact, there seems to be no limit to the combinations that can be made, using fondant as a base.

DECEMBER.

A wrinkled, crabbed man they picture thee,
Old Winter, with a rugged beard as grey
As the long moss upon the apple-tree;
Blue-lipt, an ice drop on thy sharp blue nose,
Close muffled up, and on thy dreary way
Plodding along through sleet, and drifting snows.
They should have drawn thee by the high-heapt hearth,
Old Winter, seated in thy great armed chair,
Watching the children at their Christmas mirth;
Or circled by them as thy lips declare
Some merry jest or tale of murder
Or troubled spirit that disturbs the night,
Pausing at time to rouse the smouldering fire,
Or taste the old October, brown and bright.
—Southey.

CHRISTMAS GIFTS FROM THE COUNTRY.

[Written for the Pacific Rural Press.]

"I built a chimney for a comrade old,—
I did the service not for hope of hire;
And then, I traveled on in winter's cold,
Yet all the day, I glowed before the fire."
—Edwin Markham.

This expresses the Christmas spirit which should possess us in the making of gifts. Not the value of the gift, intrinsically; but the thought which prompts the giving with the love back of it warms the hearts of the giver and the receiver, alike.

Too many of us knit our brows almost in despair over what we can give to the friend who is long of purse and thus possessed of many luxuries, perhaps. And so we either choose something far beyond our means, or sigh: "She has everything now, I can't afford to get what she is accustomed to, and I won't send something cheap." Yet just a little thought, a little "service not for hope of hire," would bring the glow of love and content.

To the country woman who has city friends there are unlimited possibilities all about for bringing to that more-than-likely socially care-worn one a breath of fresh air, a vision of

broad fields, a suggestion of the quiet and rest so much needed.

If you are near the woods, spend a few hours in gathering greens to decorate the city apartment. A few sprigs of mistletoe which sell for fabulous prices at the city florists, a box of boughs from the pepper tree with its bright red berries, even some branches from the eucalyptus with the curious seed-pods—all these and many more may be found in almost any country place.

Then from your store of jellies and jams, canned fruits, dried fruits or other products of the farm you can choose something acceptable.

You have your dairy products—cottage cheese, butter, or a jar of rich, thick, "real" cream.

There are the poultry yards and the pig pens to choose from, also,—a fowl, a basket of eggs, some head-cheese or a spare rib.

And as for raisins, figs, nuts, apples, oranges, and yes—even lemons, who would rather not have such a gift which means you than some useless gewgaw which means nothing?

Above all, let your gifts be an expression of yourself, and your distant friend, when she receives your message, will pause in her round of duties and come and sit with you awhile and refresh her spirit.

THE PUZZLING HYPHEN.

"As to lady-birds, let me tell what happened in Westport, Mass., while my family were living there. The teacher was giving the youngest scholars their first introduction to the hyphen, and they had 'lady-bug' before them on the blackboard. They knew 'lady' and they knew 'bug,' but no one in the class knew what little line in the middle might mean, and they were scared. Suddenly one little fellow remembered the sign of subtraction in arithmetic, and made up his mind that he saw just what was meant; and he read it off gleefully, 'Lady, take away bug!'—Christian Endeavor World.

"Oh, do look at that dear little lamb!" said Frances, on seeing a young lamb for the first time in her life. "Isn't it pretty?" asked mamma. "Yes; and it is so natural, too. It squeaks, just like a toy lamb, and has the same sort of wool on its back."

GETTING breakfast isn't the tedious job it used to be, thanks to modern conveniences—and Ghirardelli's Ground Chocolate. Besides, the "Ghirardelli breakfast" is not only much easier to prepare, but it's also more wholesome, more nutritious, more sustaining! Ghirardelli's is food and drink both!

Never sold in bulk—but in cans only.
In $\frac{1}{2}$ lb., 1 lb. and 3 lb. sealed cans—
at the store where you do your trading.

CHRISTMAS SNOW.

Mother Sky sits up aloft,
Cuddling her pretty geese,
Tending them with care and love,
Till the winter's cold increase.

Mother Sky has said today,
"Now the frost is thick and white,
I will make my feather bed,
I will pluck my geese tonight.

"Oh, how cosy I shall be,
On my soft and downy bed,
Underneath my coverlid,
With a pillow for my head!"

Old man North Wind heard her talk,
As he peeped behind the sun.
Then he laughed, "O Mother Sky,
We will have a little fun."

Mother Sky has plucked her geese,
Held between her ample knees.
But the feathers all have flown
On old North Wind's mighty breeze.

Gayly, gayly, did they fly,
All the air was soft with down,
And a robe of spotless white
Covered in our little town.

Who will pity old Ma'am Sky
For her feathers blown away,
When they see the children's glee
And the rapture of their play?

Shouting, leaping, with their sleds,
How they make the welkins ring,
Rosy cheeks are all aglow,
Though the cold may bite and sting.

What do you get out
of tea?

Taste and feeling.
Common tea—you know
how it tastes; and the
tannin in it is bad for
nerves and digestion.
Good tea has the real
tea-flavor: rich, delightful,
exquisite. It is the cup
that cheers.

Schilling Tea is the
fine practical economical
tea of this country.

There are four flavors of Schilling
Tea—Japan, Ceylon-India, Oolong,
English Breakfast. All one quality. In
parchmy-lined moisture-proof packages.
At grocers everywhere.

A Schilling & Co San Francisco

Christmas snow at Christmas tide
Is the best of all the year,
For it comes with holly boughs,
And the good old Christmas cheer.

THE SCHOOL CHRISTMAS PROGRAM.

What are you doing to help your
school in its Christmas program?
Have you sent word to the teacher
that you are willing to do whatever
you can? Are you making this an op-
portunity to meet the strangers in
your district?

With all our talk of Americaniza-
tion, in no place and at no time can
we make a stronger appeal to the for-
eign element than through the school
at Christmas time. Just to work with
you for the common happiness of her
children and of yours will mean more
to the wistful mother who is more
than eager to "be one of us" than any
preachments about the glories of de-
mocracy.

That great American who was
Santa Claus to the little group at Oys-
ter Bay for so many years, who was
never too busy nor too much absorbed
in larger affairs to remember the
children, who gave of himself so free-
ly,—he will be missed this year by
those who loved him, but his example
remains for all. We quote from his
"American Ideals":

"The great writers, who have writ-
ten in prose or verse, have done much
for us. The great orators, whose
burning words on behalf of liberty, of
union, of honest government, have
rung through our legislative halls,
have done even more. Most of all
has been done by the men who have
spoken to us through deeds and not
words, or whose words have gathered
their especial charm and significance
because they came from men who did
speak in deeds."

CLEANING-DAY UTENSILS.

Before buying any household device,
decide whether it will pay for itself in
the long run by saving time and
strength or wear and tear, or if it
will make some especially disagree-
able task less unpleasant. Devices
which can be used for many purposes
are seldom employed by the house-
keeper for more than one, and often
they are more cumbersome to handle
and less easily cleaned.

A cleaning cloth should be soft and
loosely woven, so that it will take up
dirt easily and itself be easy to clean.
A duster takes up dirt better if a few
drops of water or oil are sprinkled
on it. Beware of too much moisture
or oil, for it leaves streaks. For wip-
ing very dirty places use soft paper,
cotton waste, or rags, which may be
thrown away. Keep the cleaning
things together in a convenient place.
Put them away clean. Hang brushes,
mops, and brooms when not in use.

Clean string mops by shaking over
a damp newspaper or a can. Wash
occasionally in hot water with wash-
ing soda or soap and dry quickly.
Sprinkle a few drops of oil on the oil
mops after cleaning.

Long handles on brooms, brushes,
and dustpans save the back, the office
of Home Economics Kitchen, of the
Department of Agriculture suggests.

Clean carpet sweepers frequently.
Empty the box on damp newspaper
and use old scissors and buttonhook
or coarse comb to remove the hairs
dirt on the brushes. Keep the bear-
ings oiled.

BEE CULTURE FOR WOMEN.

Mrs. Martinelli gave a fine demon-
stration of the possibilities of bee cul-
ture on the part of women at the
last meeting of the Home Demonstra-
tion Department of the Farm Bureau,
at Ripon, San Joaquin County.

Although she has not entered into
the business upon a commercial basis,
Mrs. Martinelli has sold honey of the
finest quality in small amounts. She
has made a study of the business, and
is provided with all the necessary
equipment for carrying it on success-
fully, and she thinks there are splen-
did opportunities for women in this
work.

Karo

Make Your Christmas Candy at Home with Karo

THE variety of wholesome candies so
easily made at home with Karo syrup
gives a really intelligent solution of the
Christmas candy problems.

Its lots of fun for the children themselves
to make it and Karo always insures success.

Christmas candies cost more than ever this
year. Karo candies are as good as can be
bought and at a fraction of the cost of good
store candy.

The Most Delicious Caramels You Ever Tasted

KARO CARAMELS

- | | |
|------------------------|----------------------|
| 1 cup Granulated Sugar | 1/4 cup Vinegar |
| 1 cup Karo | 2 tablespoons Mazola |
| 1/4 cup Water | 1 teaspoon Vanilla |

Boil the sugar, Karo, water and vinegar six minutes,
and add the Mazola. Cook till it forms a soft ball in
cold water. Remove from fire, and stir in the vanilla.
If preferred, one-half cup of candied cherries, cut in
halves, may be added. After heating thoroughly, turn
into tins well oiled with Mazola. Mark in squares when
cool, and cut when cold. Wrap each cube in waxed paper.

FREE Beautifully illustrated Corn Products Cook
Book of 64 pages containing more than a
hundred valuable recipes for candies of all kinds, cakes
and pastry of every variety, sauces, and salad dressings.
All recipes originated by leading professional cooks
and endorsed by Domestic Science Experts. Every
housewife should possess a copy of this book—sent
free. **WRITE TODAY.** Corn Products Refining Co.,
Dept. 42, P. O. Box 161, New York City.

Lights with a Match!

NO torch needed with this new
lamp. Just use a match, as with the old
oil lamp. Gives a brilliant, steady, white
light of 800 candle power, brighter than the
brightest electric light, safer than the safest
oil lamp, cheaper than the cheapest candles.

Coleman Quick-Lite

makes and burns its own
gas from common gaso-
line. No wicks to trim—
no globes to wash. No
dirt, grease, smoke or
soot. Absolutely safe,
no danger of fire or ex-
plosion. Fuel can't tip-
ple—no danger if tipped
over.

VEGETABLES.

As a result of the freezing weather in Oregon, Idaho and Washington, the supply of potatoes from those States has been cut off, consequently a sharp advance in prices will be noted. Very good receipts of California stock. Many of the Burbank's are going into storage and will be held for the January market. Onions in light supply, but good demand and higher. Prices for all staples are generally higher.

Potatoes, Northern Burbanks \$4.25@4.50
do, Idaho Russets, cwt.\$4.50
Sweet Potatoes\$2.25@2.50
Onions, Stockton, yellows, cwt.\$3.85@4.00

LIVESTOCK NOTES.

(Continued from page 867.)

One of the calves is sired by Bonnie Brae 8th out of a Domino dam, and the other is a son of Beau Blanchard, for which Jesse Engle & Son recently refused \$35,000.

Reports from Montana indicate rather serious conditions on the cattle ranges of that State, owing to the shortage of feed and extremely cold weather. One rancher slaughtered 17 head for beef rather than try and carry them through the winter.

Frankenheimer Bros. of Stockton are running about 1400 head of Short-horns on their range, 35 miles south-east of Stockton. Their senior herd sire, Greenwood King 2d, is from the T. S. Glide herd at Davis. This sire is having a pronounced effect in building up the herd, they report. They recently sold a carload of steers direct from the range that averaged 1257 lbs. after the shrink at 3 years old.

Sheep.

Joe Levy of Manteca, proprietor of Calla Grove Stock Farm, is leaving for Idaho, Utah and Wyoming, this week, to buy several carloads of Hampshire sheep. This stock will all be registered.

Walter Priddy, shepherd for Bullard Bros. of Woodland, was in San Francisco recently after the fall trip at the various fairs and livestock shows. He reports a good time at the Pacific International at Portland, where the Bullard flock won all the blues but one, and all championships and grand championships with plenty of competition. Mr. Priddy was sorry that it was impossible for them to show at the Chicago International this year.

Miscellaneous.

Glenn County Fair dates are announced for September 27 to October 2, 1920. They expect to have a bigger fair than ever.

To obtain better accommodations at the fairs when showing stock, the herdsmen in charge of the purebred stock of the State have organized an association to assist them in procuring what they need. J. E. Thorpe of Lockeford was elected president, and E. F. Curtis of Modesto, secretary. Those who know the life a herdsman leads while on the fair circuit, realize the difficulties under which they labor. They are obliged to live on the fair grounds almost always, without proper shelter or toilet conveniences. Often the restaurants are of the poorest and charges the highest. We hope ill get what they need.

SCHOOL LAND SCRIP SALE.

A public auction sale of scrip will be held by W. S. Kingsbury, Surveyor General, at the State Capitol, Sacramento, at ten a. m., Monday, January 5, 1920.

Scrip can be purchased only by citizens of the United States who are residents of the State of California and who have not filed applications for school land with the Surveyor General amounting to 640 acres. Scrip is not transferable. It is sold in forty-acre lots for cash, and the surrender of the scrip is payment for that amount of government land.

Persons who have only purchased school lands at public auction are qualified to purchase scrip.

The purchaser of scrip is entitled to apply through the Surveyor General for non-mineral land of the United States.

Homestead and desert land entries can relinquish their entries through the Surveyor General and acquire title to the land through the purchase of scrip. The applicant need not live on or improve the land.

The proceeds from the sale of scrip go to the support of the public schools of the State.

For violating the State fruit standardization law four Watsonville fruit packers were each fined \$50 in Judge Samels' court in Oakland last week. The fruit, which was marked "fancy," was wormy and contained decayed spots.

George Peters, president of the California Certified Seed Potato Association, went recently to Los Angeles to attend two meetings of the organization regarding the growing of seed potatoes in the State. The price paid for the seed now is \$5.50 per hundred. Mr. Peters says: "If the potato seed is grown in this State this price will be greatly reduced as well as the quality of the potato being better and the crops more certain. As it is, unless the seed is certified, the crop is a gamble."

Tulare is trying to secure a plant to gin cotton. Tulare cotton is now ginned at Fresno.

MISCELLANEOUS.

TRACTORS.—One of the oldest and best on the market, to exchange for realty in Bay section. I have retired from the tractor business, recommending my pre-war business, and have 2 ten-horse power at \$1850; 1 15-horsepower at \$2850, new, up to date, with special low gears and wide rims for heavy work. Will exchange for improved or unimproved property in San Mateo or Bay Counties. Eri H. Richardson, 77 O'Farrell St., San Francisco.

FOR SALE.—At Antioch, 750 wood trays, 72 inches long, 28 inches wide, 3 inches deep, inside handles each end, 1x3 cleats on bottom for stacking. Ideal for drying fruit. Will entertain any reasonable offer. Illinois Pacific Glass Co., 15th and Folsom Sts., San Francisco.

ASPARAGUS ROOTS.—Palmetto bright green, 40 cents per dozen; \$3.00 per hundred. Seed corn. Country Gentlemen, 10-lb. lots, 15 cents per lb; 12 1/2 cents per lb. in 100-lb. lots. Address R. M. Graham, R. F. D. No. 1, Box 83, Colton, Cal.

MADE OF REDWOOD, Hawley's Perforated wooden well casing, the best and cheapest well screen made. Send for descriptive circular. G. M. Hawley, La Mesa, California.

ALL SIZES OF PIPE and screw casing, both new and second-hand, dipped and undipped. Guaranteed. Prices right. Sheeter Pipe Works, 304 Howard St., San Francisco.

\$2,000 HOLT "30" FOR SALE.—In good condition; tracks almost new; and a five-disk Moline plow. Address: J. M. Nelson, 16 N. First Street, San Jose, Calif.

WANTED.—Position as herdsman or superintendent stock ranch. Experienced A. R. O. work, showing, calf raising, and in growing alfalfa, corn and beans. Best references. Address 2932 Eye St., Sacramento.

WANTED.—Layne & Bowler, Byron Jackson, or Johnston deep well pump, capacity 1,000 to 1,500 gallons per minute. Prefer the direct connected with electric motor. Geo. A. Smith, Corcoran, Cal.

COTTON PICKERS AT WESTHAVEN Ranch, Westhaven, Fresno county, Calif. Large acreage. Long job.

REMANUFACTURED PIPE.

All sizes standard pipe and wrought iron screw casing. All kinds of fittings. Guaranteed good as new. Write for prices. Weisbaum Pipe Works, 160 Eleventh street, San Francisco.

25 H. P. FAIRBANKS MORSE Gas Engine in good condition for sale. Also portable steam boiler and engine. \$500.00 takes both. Massey Thomas, Gilroy.

AT A BARGAIN.—K hand-power stump-cable, including 2 blocks, 1 take-up, 200 feet cable—almost new. Fred H. Bente, 333 College Ave., Santa Rosa.

HOLT 30-CATERPILLAR—new tracks, engine recently overhauled. 5 disc plow, 8-ft. double disc harrow. A bargain. \$2,000. Fair Oaks Ranch, Willels.

FIRST CLASS DAIRYMAN, married, wishes position as herdsman or dairy foreman, lifetime experience; best of references. Box 1730, Pacific Rural Press.

FORDSON TRACTOR.—Used very little and in good condition. Oliver tractor plow. A bargain. \$600. L. M. Ulery, King City, Cal.

CROLEY'S BALANCED HOG FEED.—The cheapest feed to fatten hogs. Write Geo. H. Croley, Townsend St., San Francisco, Calif.

SANDUSKY 10-20 TRACTOR.—Just overhauled, guaranteed good as new. R. A. Sevier, Arroyo Grande, Cal.

SUDAN.—We want to buy Sudan grass seed. Send us samples. Bomberger Seed Co., Modesto, Cal.

WANTED.—Used 6-ft. Double Disk in A-1 condition. 142 R. B. Alum Rock Ave., San Jose.

COUNTRY LANDS.

196 ACRES, WITH Stock and Tools, \$5000
In fine farming section, few hours one of leading cities of U. S., near good town, 16 miles large local city. TRACTOR PLOW BARGAIN

CALIFORNIA PLOW COMPANY

(Formerly Spalding-Robbins Plows.)

8 new "Ground Hog" tractor disc plows specially designed for hard ground. Now at Oakland warehouse. Do not want to move them to our new plant at San Jose. (1-4 furrow, 2-5 furrow, 3-6 furrow, 2-8 furrow.)

140 Polhemus Street, Write for Circulars, SAN JOSE

TRACTOR PLOW BARGAIN

Two John Deere Heavy Engine Disc Plows, practically new; used for demonstrating only; plowed only 100 acres.

HEALD'S ENGINEERING AND AUTO SCHOOL

1220 POST STREET, SAN FRANCISCO

CUSHMAN

8 H.P.—2 Cylinder Weighs Only 320 Lbs.

Original 4 to 20 H. P.

Light Weight, All Purpose Farm Engines

Lead the world in superiority of design, material, construction and equipment—no other line of engines built for farm work comparing with them.

They weigh only 40 to 60 pounds per horsepower—only about one-third as much as ordinary farm engines—yet run even more steadily, quietly and economically.

They do every job that any other engine can do, and many jobs other engines cannot do. Equipped with Throttling Governor, Carburetor, Friction Clutch Pulley and Water Circulating Pump without extra charge.

Write for Book on Light Weight Engines. Cushman Motor Works, 956 N. 21st St., Lincoln, Neb.

Cushman "Does More" Electric Light and Power Plant

It does more for the farmer than any other outfit—combining both an Electric Light Plant and a Portable 4 H. P. Power Plant in one outfit, at practically the cost of an electric light plant. Equipped with the famous Cushman Engine and Cushman Self Starter. Ask for Book on Light Plants.

Cows know what they like

Not only must the feed for your cows *be* good—it must *taste* good to them! Your cows know what they like. And—you know that the most profitable cow is the cow that converts the most feed into money. It will pay you to feed SUREMILK because your cows “take to it” naturally. They will yield more milk—and that means more money.

SUREMILK is a highly concentrated grain feed. It has a higher feeding value than any one grain because it is a *mixture of grains*—and, therefore, more palatable.

Moreover, comparative feeding tests have proved that SUREMILK will give better results—either more butter fat or greater increase in weight—than any single grain.

Special note to hog-raisers

Hog-raisers have found that feeding SUREMILK builds the porkers up and fattens 'em up. It's better than any one grain such as corn or milo or millet—because it is a mixture of *many* grains. Economical, too—because it is highly concentrated in feeding value and does not bulk.

If you want to know just how different stock feeds compare in food value—send for the new edition of our booklet, “Converting Feed Into Money.” Full of practical information and profit-hints. Send for this booklet today—it's free. Simply cut out and mail the coupon below.

How the California Feed Law Affects Proprietary Feeds

By GEORGE R. McLEOD
Agricultural Department
Sperry Flour Co.

All proprietary feeds sold and distributed in California after the first of November, 1919, are affected by the feed law passed at the last session of our Legislature. This law not only requires the names of the different ingredients, but also the minimum percentage of protein, the minimum percentage of fat, the maximum percentage of ash and the maximum percentage of fibre contained in the feed.

Similar laws have been in force in many of the Eastern and Middle Western states for the last ten years, resulting in the education of all consumers of feed. In the different states where these laws have been in effect for some time, consumers are now buying feeds on the actual net feeding value that they contain, without regard to color, texture, etc.

California feeds have been bought and sold largely on color and texture, the feeder depending on his eye to determine the value of the feed.

What Goes Into a Feed?

All feeds are composed of moisture, ash, fibre, protein, carbohydrates and fat. A feed low in moisture has more value than one high in moisture, because this element can be supplied cheaper from the well. Ash is the mineral matter contained in any feed and a low ash content denotes high feeding value. Fibre is the structure around which nature builds the other substances during the growth of the plant and it has little real feeding value, although some is necessary, as it makes a feed more bulky and allows the digestive juices to act more freely. While a certain amount of fibre is digestible, the cost of digesting and assimilating is nearly as great as the feed value derived from it. It is on this account that a low fibre content also denotes a high feeding value.

Summing up the different substances which go to make an economical mixed feed, it is necessary to select one with a low moisture, low ash, and low fibre content—as the average feeder can supply these more cheaply himself.

The Feed Must Taste Good

Palatability is another factor that enters into the value of a feed, inasmuch as the animal that converts the most feed into money is the most profitable one; and a feed must be palatable for an animal to consume a large amount of it. A mixture of grains always has a higher feeding value than any one grain fed alone, because it is more palatable on account of the variety.

WE WISH ALL OUR READERS ANOTHER HAPPY AND PROSPEROUS NEW YEAR!

VOL. XCVIII—No. 26

Forty-ninth Year

THE PACIFIC RURAL PRESS

SAN FRANCISCO

DECEMBER 27, 1919

LOS ANGELES

Greatest Year in California Agriculture

Written for Pacific Rural Press by R. E. Hodges.

LAST DECEMBER we chronicled the highest value and greatest acreage of farm crops ever produced in California. That might have been considered a high mark for years to come; but the figures for 1919 prove it was only a stepping-stone to greater achievement. Farm values to the producers of a few leading farm crops in 1919 totaled \$485,555,000 as shown by figures printed on other pages, furnished by E. E. Kaufman and J. E. Rickards, of the U. S. Bureau of Crop Estimates. These do not include the thousand and one crops of less importance which bring many millions more of income to our ranchers, nor do they include any of the livestock and dairy products which are valued not far below the products of agriculture or horticulture. These are discussed fully on other pages of this issue.

The farm value of the leading field crops alone was \$260,477,000, an increase of \$16,878,000 over 1918. The increase might have been much greater had it not been for the shabby treatment accorded our bean grow-

producers are this year getting over \$225,000,000 for the leading fruits of California, and it is also significant that this figure is an increase of more than \$50,000,000 over the record values of 1918. Fruit production is increasing faster than any other line in California; and it is due to the safe markets assured by co-operative organizations. Consumers are greatly benefited by the increased production, and producers are not hesitating to pay the unheard of prices asked for nursery stock. Every tree available will be planted in orchards this winter. The unorganized field crop producers may well take heed.

Prune growers are receiving four times the money they received last year. Raisin growers are receiving nearly \$18,000,000 more. Peach growers are getting about \$10,000,000 more than they did in 1918; and pear growers sold for a \$2,000,000 increase. Apple growers had a heavy crop and high prices—a 50 per cent increase over last year. Apricot growers are getting over \$13,000,000 for their relatively small production of 165,000

Development of California farm land for more intensive cropping by irrigation is going on at a rapid rate. Power machinery is a great factor.

ers. Agricultural regulators may well note that bean growers turned 197,000 acres in California alone from beans to other crops due to what is considered unfair treatment. So quickly do they respond to market conditions, whether the latter are manipulated or not. This year's total bean crop is valued at less than half that of 1918.

Value of the 1919 wheat crop was double that of 1918, and the acreage was nearly doubled. Barley lost some acreage, due to the market stagnation at planting time, but a rise in prices and better yield per acre increased the total value of the crop by nearly three million dollars. Grain sorghums decreased a little in acreage and more in total value, but Indian corn increased in acreage and dropped some in value due to the lower yields and prices. Rice showed a 30,000 acre increase and a decrease in yield per acre, but an increase in total production and a 50 per cent increase in total value. Rice growers will get over \$7,000,000 more for the 1919 crop than for that of 1918. Cotton growers also get practically the same increase in dollars and percentage. Hay growers get \$14,000,000 increase over last year. Sugar beet growers get more money than last year in spite of the fact that about two-fifths of the planted acreage was not harvested, due to various unfavorable conditions.

The Greatest Increase Is in Our Fruits.—It is a glorious fact that

tons of fresh fruit. Almond and walnut growers exercised great self-restraint in setting their prices; but while their tonnage is relatively small, their returns are high. Walnut growers are getting fifteen and a half million dollars for about 26,500 tons and almond growers are getting nearly \$3,000,000 for 6,800 tons. Orange and lemon growers could not prevent the high prices they received for an increased crop because they offer each lot on the open market for whatever price the buyers will bid. The orange crop is reported slightly less than last year, but at that the returns to growers fall not far short of \$50,000,000. The lemon crop is 50 per cent greater than last year and its growers are getting about \$12,744,000. Table grape production and prices increased over last year. Wine grape production decreased but prices increased. In both cases some loss occurred due to car shortage, but the farm value of the table grape crop is estimated at \$9,000,000 and of the wine grape crop at \$7,500,000.

Most of our California ranchers have small cause for complaint over their financial returns, even though the costs of production were never so high before. Most ranchers have money in the banks, a great deal of which will be spent for labor-saving machinery, fertilizers, and better home equipment. Consumers have no real cause for complaint, because California farmers have produced more food than ever before.

EDITORIAL

A GOOD YEAR GONE!

WE GIVE thanks for the good things which the closing year has brought to California and we rejoice over the perils which have not arrived. All through the year the champion of disorder has menaced our substance; the profiteer has made it well-nigh impossible to live, and near the end of the year the false prophet essayed to throw our rag-wrapped skeletons upon a bi-plane of blast and quake to waft us to what windrow of desolation in the illimitable ether, neither he nor he who gave respect and publication to his abominable untruths knew nor cared. But neither anarchist, nor profiteer nor prophet, nor he who served either of them, has wholly prevailed against us. Are we not still alive? Aha!

A FARMER WINS OUT!

When we think of the many fakes, exactions and discriminations which are put upon our farmers (and the Farm Owners and Operators Association gave an excellent review of them on page 852 of our last issue), we are prone to wonder how they succeed in saving their industrial lives. And yet farmers always have and, for the life of the world, they always will. The oldest book of the Sacred Scriptures, written long before Moses thumbed out his book of Genesis upon his prehistoric typewriter, tells the story of an old farmer of the land of Uz who homesteaded on a tract of vacant wilderness and pursued a policy of thrift and production until the assessor listed him for 7,000 sheep, 3,000 camels, 500 yoke of oxen, 500 she-asses and a very great household. In fact this old farmer was counted the greatest of all the men of the east. And he trusted in the Lord and though his sons and daughters went to the devil in all the ways known to the ancients, the old man told the devil to go to hell where he belonged and continued to offer sacrifices daily not only for himself and the old lady but for all his erring children. Then it was the devil stumped the Lord to let him try to put one over on the old man, claiming that he was only good because of what there was in it for him and not because he really liked it. And the Lord said: "Go to it so long as you do not kill him." And so the devil burnt up all the family but the old man and his wife (whom he saved for a "strike leader"); ran off all the live stock, destroyed all the crops and threw the old man on an ash-pile with as many boils on his back as there are holes in a barn-door after a farm-boy's shooting-match. And while the old man writhed in his misery the devil sent the old woman and a bunch of Bolsheviks, "humanitarians" and weather-prophets to tempt him to deny his faith in the principles of trust and fair dealing by which he had formerly prospered. But it would not work, for the old man declared he would rather have boils on his back than sin in his soul—

Then Job answered the Lord and said: Who is he that hideth counsel without knowledge? * * *

I have heard of thee by the hearing of the ear; but now mine eye seeth thee * * * So the Lord blessed the latter end of Job more than his beginning!

Thus did Job, the farmer of ancient record, do a good job and his example liveth to this day. For all the good things of the closing year let there be thanksgiving; for all the evil, incurred or falsely feared, let there be repentance and humiliation; for all there is to come, either of good or evil, let there be hope and trust guided by truth reasonably discerned and foretold. We have had narrow escapes—the dangerous narrowness thereof being in our own lack of faith and knowledge!

THE GREATNESS OF THE CLOSING YEAR.

But the chief end of this issue of the Pacific Rural Press is not preaching. It is to set forth concrete facts upon which each thinking reader can preach for himself. Prominent space is given to actual records and careful estimates of what agriculture has done, during the year 1919 for the prosperity of Californians and the development of the State. We are exceedingly fortunate in the fact that the United States Department of Agriculture has established a California branch of its statistical work and by the efforts of its able and devoted representatives in San Francisco has organized throughout the State a reporting force of observers by whom crop-figures are made available with the dew of the morning—after still upon them. This is in marked contrast to the dried and shriveled and to the fanciful and inflated estimates—in both of which directions annual reviews have unavoidably erred hitherto. Although these figures, which are amply given and commented upon on other pages, may not be perfect, they are so much better and are traceable to honest and intelligent effort at compilation, that we are delighted with the opportunity to set them forth. It is desirable that they be appreciatively received and considered in the spirit of constructive criticism—that the government may be encouraged to continue its effort and perfect its system if error can be pointed out in either effort or achievement. Although there may be a claim that the State should do this original work in collection of industrial facts for itself, there remains the fact that figures by the general government will be received by the outside world with more confidence than any declarations by the State for itself ever could be; also that such figures are more comparable with the statistics of other states than our home-made figures are likely to be. Thus not only a universally credited review of our direct achievements but a showing of our relative standing with other states in the various lines of production is provided for.

We have supplemented the government figures in the crop lines which they cover with such data as we can compile of production in other branches of our farming industry. It will be gratifying to all who rejoice in the advancement of California to learn how great are the volumes and values of farm production which are being attained. It is now rendered reasonably certain that the figures of 1919 which will take their places in the national census of 1920 (to be taken next month), and that they will show forth great increases over the last entry in the decade-series of the U. S. Census Bureau, which was that of 1909. It is important also to have surety that the gain in population, in financial operations, in manufacturing and commerce will show that our State growth has been symmetrical and complete, and will thus demonstrate the even and satisfactory development of all the interests of the commonwealth.

A FINE LINE OF EXPORTS!

If we mistake not, economists agree that the solvency and prosperity of any country depend upon the character and volume of its exports. Therefore we see deep and enduring significance in this announcement:

New York, Dec. 21—The Army transport Buford, the "ark" carrying back to soviet Russia Emma Goldman, Alexander Berkman and more than 200 other radicals, sailed today. The Buford was stocked with provisions sufficient to last 500 persons sixty days. The destination is not known, even to the captain, who has sealed orders to be opened twenty-four hours away from port. The radicals have been promised they will be sent to "red Russia." All were well provided with Amer-

ican money and clothing to withstand a rigorous winter.

As to the character of these exports it may be said they are of a kind least needed in this country and therefore their shipment counts us the greatest net gain. As to their volume, it is undoubtedly true that it is much less than we could wish it were. Judged, however, by the volume of perditionous hot air it is capable of generating, the cargo of the Buford is no mean quantity. General Leonard Wood, who has charge of suppressing anarchy in this country, is reported as saying the other day: "Those who are aiming at the destruction of this country should be shipped out in ships of stone with sails of fire and with hell as the first port of call." The words are somewhat picturesque, but wholly patriotic.

If some kind-hearted reader should think these comments harsh and that we should deal more gently with the erring, let him harden his heart with a fuller understanding of the peril which actually impends. As the ship Buford, in the gray of the morning, was passing under the gleam of the torch surmounting the statue, "Liberty Enlightening the World" in New York harbor, several of the deported anarchists shouted these words:

"We are coming back and we'll get you. To hell with America! This is the beginning of the end of the United States government. I am not going to stop my work as long as life rests with me. The anarchist movement will be carried on in the United States, although the intellectual heads, the real top of the movement, are now being sent away."

Such treachery to American aims and purposes would have shocked almost into insensibility our ancestors who established the government. They could hardly have conceived it to be possible. It is for us to realize such infamy and to effectively protect law and order and the attainment of progressive liberty, as the constitution of this country provides, against those who "fear not God, neither regard man."

ATTACK ON PRODUCERS' CO-OPERATIONS.

Perhaps the same bunch of politicians which attacked farmers' selling co-operations during the last legislature is now instigating a petition-movement among consumers calling upon Governor Stephens to remove Market Director Weinstock and call an extra session of the legislature to pass laws against profiteering. It is possible also that the effort is being urged by some kinds of merchants who desire to get for themselves the rewards which producers are now getting by their co-operative selling organizations. It is reported that Governor Stephens has said that he will do nothing of the kind, but the onset which is now being made upon the farmers' rights to co-operate and sell collectively should be understood and combatted by those who know the purposes of these organizations, so that those who do not know these purposes shall not be deceived and made to support the schemes of politicians and commercial profiteers. In the course of a public communication which Col. Weinstock is making this week the following indisputable facts are set forth:

"Without collective action for co-operative marketing, it is a practical certainty that the consumers would pay fully as much as they are now paying and the producers would get far less than they are now getting, all of which would tend to discourage them from further production." This has been illustrated by past conditions in California. Therefore, to deprive the producer of this right to organize, which would in no way help the consumer, would throw the State of California, so far as marketing of its farm products is concerned, back into the chaotic and unsatisfactory condition of the past, thereby tending to discourage increased

CALIFORNIA WEATHER RECORD

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending December 22, 1919.

Stations—	Past Week	Seasonal To Date	Normal		Highest	Lowest
			To Date	To Date		
Eureka	1.30	8.38	14.67	06	38	
Red Bluff	.34	3.86	8.72	54	32	
Sacramento	.11	3.00	6.03	64	34	
San Francisco	.30	4.32	6.90	60	43	
San Jose	.01	3.10	5.18	66	30	
Fresno	.00	1.48	2.89	70	32	
San Luis Obispo	.00	5.18	4.04	76	36	
Los Angeles	.00	4.27	4.13	76	50	
San Diego	.00	2.20	2.47	72	48	
Winnemucca	.00	2.60	2.82	48	4	
Reno	.00	3.86	3.25	54	14	
Tonopah	.00	1.59	3.48	48	24	

acreage, and by decreasing production put further burdens on the consumer."

Producers are playing fair in their co-operative organizations. They are jealously guarding the true co-operative principles they have invoked to enable them to continue to feed consumers. Deluded consumers should not allow displaced middlemen to use them to batter the safeguards which producers have established around consumers' true interests and their own!

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Mustard Growing.

To the Editor: Wild mustard grows on my ground like a canebreak. Does it follow that tame mustard would do well? Please tell me where the requisite data can be found regarding tame mustard, answering the usual queries regarding planting, harvesting, soils, etc.—H. S. E., Princeton.

Most of the mustard grown in California, and most of the knowledge about it also, are confined to the Lompoc district of Santa Barbara County. The occurrence of wild mustard is a good pointer toward the commercial crop—a good part of which is black-seeded wild mustard either reaped by itself or screened out of barley. Recently more white mustard has been produced. Mustard is grown like grain, and handled with the same machinery and it is necessary that the plant should grow so that this can be done. Mustard which grows as you describe could hardly be handled economically—unless you could run a wood-yard in connection with a mustard-thresher. Profitable conditions seem to require that the plant should stop growing and go to seed at a reasonable distance from the ground, and probably your land is too moist and rich for that. We should not try to break into the Lompoc mustard growers' monopoly without going down there and calculating on the conditions which enable them to do it. War always makes mustard high and we imagine that it will be rather a close business again—unless you can get some assurance that mustard can be used in hot drinks in place of ingredients now prohibited.

Foothill Fruit Tree Gumming.

To the Editor: My plum and cherry trees are gumming badly. What is the cause and is there any remedy for it? Location cannot be the trouble, as it is as prevalent on high ground as on low. The trunk on a good many of my young trees, from crown to root, has a greasy look. Do you think it will kill the trees? The gum on some of them is very heavy.—Inquirer, Bowman.

This trouble has been reported on stone fruits from the higher foothills for many years. We are not aware that the cause has been demonstrated either by practical observers or by systematic investigators. If definite conclusions have been reached by either party we shall be glad to hear of them. It has been imagined to be due to the super-heating of the surface soil, which is common where the sun has such chance to get at the soil around the root-crown as it has on slopes at that altitude. The late Felix Gillet had much trouble with it in trying to propagate and establish the imported prune varieties and he concluded that bark conditions at the budding region had something to do with it and that he could escape it by growing his trees "true from the root"—that is by growing them from cuttings or suckers without budding. If it is due to soil-heat, thorough white-washing and keeping down the heat by mulching around the trees ought to be preventives. It is capable of killing the trees.

Sprouting Myrobolan Pits.

To the Editor: Kindly give the proper method of germinating myrobolan plum seed: I have used about 10 pounds of seeds the last three years trying to sprout them, but they will not start for me.—E. A., Farmington.

To the Editor: I am considering planting some myrobolan pits for roots for nursery stock to replace lost trees in my orchard. What is the best time for planting, budding and grafting, also the best depth of planting?—J. S., Los Gatos.

The secret of an easy start for myrobolan and other plum pits is not to allow them to become dry. As soon as the surface becomes well dried after washing from the ripe fruit, the pits should be sandwiched with sand and kept reasonably

moist. When the ground is deeply moistened by the fall rains the pits may be planted in nursery rows or they may be kept in the sand or put in a sprouting bed and examined from time to time and planted in nursery rows after the sprouts are out a little. This is the way to get a full stand in the rows, as only the pits which have started are planted. If the seeds have been allowed to dry out after gathering they should be soaked a day or two and then put into the sand or seed-bed for sprouting. It is all the more necessary to do this forced sprouting with dry seed because only a part of them will start even with such treatment. As for the details of getting home-grown trees, there are so many suggested and so many devices for insuring the work with the least trouble, that we have made them a leading feature of our book, "California Fruits and How to Grow Them," and have described the best ways for growing trees of all kinds of fruits—including budding and grafting operations for each of them. Everyone who proposes to grow his own trees should at least start with the advantage of this information. He will have plenty left to learn by experience, but he will save many times the cost of the book by not trying to pull the whole subject out of his own noddle or take the chances of getting it by line-fence talks with his neighbors.

Plowing and Transplanting Oranges.

To the Editor: We have a ten-year-old orange orchard which has never been plowed. There is a heavy plow pan at about five inches deep. Would you plow it and how? Is it profitable to move 5-year-old orange trees, and what would be the process?—J. R. A., Merced.

We would start in whenever the soil works well and plow the middle as deeply as we could without pulling out large roots—raising the plows when coming nearer to the trees. The point would be to get under the plow-pan even at the loss of some roots. We would not stop for small roots for they will be readily restored when you get air and water into the soil—providing you use manure generously and irrigation water as required. Five-year-old orange trees can be successfully moved by taking them up with good sized balls; if you rig up a good lifter to get them out of the old holes, onto a sled and then into the new holes, which should be large enough to take the balls and to make sure that the filling around them is well done and water-settled. The tops should be cut back considerably. The transplanting can be successfully done, but we are not sure that it can be profitably done. It would probably require more skill and money than to start with good young trees.

Almonds, Chickens and Alfalfa.

To the Editor: I am up against the dangers you mentioned in your issue of November 12, as possible with chickens, chicken houses and alfalfa. I have five acres of almonds and am putting one acre in alfalfa among the trees. Can I save that acre of almonds by careful irrigation? The droppings from chicken houses and other places I am taking to an apricot orchard. I know what sour sap will do, yet I believe I can do it. What do you think?—P. G., Oroville.

Why, yes, if you neither drown nor famish the trees for the sake of the alfalfa, and if the chicken manure is not in excess amounts, the trees ought to like the situation. The growing alfalfa will postpone the souring or over-nitrating of the soil—which is dangerous when an orchard is turned into a hen yard and kept at it too long.

Bean Straw Not for Silage.

To the Editor: Will it pay to put bean straw into the silo? Can it be put upon corn after the silo is about half full? The cost would be about \$65 to put 50 tons in. Or would it be better to feed it without putting into the silo?—W. L. D., Modesto.

We are not sure that it cannot be done if properly cut, moistened and tramped down, but even if decay should be arrested it would be rather nasty in flavor. In its natural condition it is a fine roughage to feed with corn silage and we should use it that way.

Bearing of Imperial Prunes.

To the Editor: I have one acre of Imperial prunes four years old, and up to this time I have had no fruit. I have read that it is necessary to have another variety to pollinate them. I have room enough on the east to plant five or six rows more trees. Shall I plant a row or two of Sugar

prunes and fill out with the Imperial, or what is best in this case?—C. W. E., Kingsburg.

Passing the point that your trees are rather young to bear and that the Imperial may have other reasons for shy-bearing than lack of effective pollination, it may be said that the University experiments, as summarized by Professor Tufts, show that the Imperial imperatively needs association with other varieties and that the common French and Sugar prunes have been shown to be good pollinators for it. Therefore, your proposition to plant Sugars is reasonable so far as pollination goes. The Sugar is proving profitable with many growers for its large cured-size and as a shipping plum also—though its flavor and texture when cured are inferior. We would be personally inclined to brace up Imperials with French rather than Sugar, unless you can prove from nearby experience that Sugars are particularly profitable.

Plowing Frozen Soils.

To the Editor: Experienced ranchers in my immediate vicinity inform me that it is poor for the soil, and poor crops of grain will result if the land is plowed when it is frozen. We have been having very cold frosty mornings this last week, and the ground is hard, but eventually when the ice thaws out won't the ground soften? Would you advise not to plow under these conditions and why?—H. K., Fresno.

The kick against plowing hard frozen ground would probably come from the team rather than from the soil. The effect of frost on the soil is disintegrating, or, as the common expression is, frost "slacks" the soil—the analogy coming from the crumbling of lime while slacking its thirst for water. This "slacking" of the soil by frost is an ultimate effect and while the process is going on the soil should not be worked nor trampled upon. The first effect of thawing is to fill the soil spaces with water and if plowed then the effect is to run the particles together or to puddle it—just as it is from plowing the soil when it is too wet from rainfall or irrigation. Do not, therefore, plow the land when it is thawing, and the reason is not because the ground is frozen but because it is too wet from the immediate after effects of freezing. "Let the frost get out of the ground" really means "let the excess water from thawing distribute itself" before plowing.

Scions and Bud-Wood.

To the Editor: I have a lot of California black walnuts to be grafted. Should the wood for grafting onto these and the myrobolans be taken now or left on the trees until the time for grafting and budding?—R., San Jose.

It will be safer and easier to leave the walnut scions on the trees until February and then take them, while still dormant, and put them in moist sand in a cool place until you graft them in a little later—just before the growth starts in the stock. Plums are budded on myrobolan and the buds are taken from the new growth when the budding is done—that is next July and later. If, however, you are grafting plums the same rules apply as for taking walnut scions.

Rye Grass for a Low Place.

To the Editor: Will Italian Rye grass kill alfalfa or not? I have a piece of low land in the middle of an alfalfa field, where alfalfa will not stand more than two years or less. I am advised to sow rye grass on it for cow feed. Do you think it will do well?—C. P. B., Madera.

The advice given you is good. Rye grass will not kill alfalfa in a place suited to alfalfa, but it will grow triumphantly on places where alfalfa is killed by standing water. It will also endure considerable alkali; more in fact than all other introduced grasses except Bermuda. Therefore, if you have much alkali to reckon with, Bermuda is better than Rye.

Plum Aphis.

To the Editor: When the leaves came out on my prune trees last spring I noticed they were covered on the under side with millions of small bugs, light in color, and on top the leaves were covered with honey dew. What is the best and most effective spray for this trouble and when should it be applied?—C. W., Kingsburg.

It is the plum aphis. Spray thoroughly as soon as you see the first of them next spring with a good spray pump and nozzle to hit the under sides of the leaves. Use 40 per cent tobacco extract, one pint to 200 gallons of water and repeat as soon as you see them multiplying again.

Outlook for Tariff on Oriental Beans

By Aaron Sapiro, Attorney for California Bean Growers' Association.

In September, 1919, the California Bean Growers' Association authorized C. L. Preisker of Santa Maria, C. K. Hardenbrook of Lompoc, and Aaron Sapiro of San Francisco to go to Washington as a Tariff Committee and present to Congress the justification for a tariff on foreign beans, particularly Asiatic beans. The committee determined to make the tariff campaign a national issue and not merely a demand for protection by California bean growers and arranged for conferences with bean growers and dealers of Colorado, Michigan and New York, so as to secure the active support and co-operation of the bean industry of the United States.

The New Mexico Bean Growers' Association authorized the California Tariff Committee to represent them formally in any presentation at Washington.

At Denver, Colorado, the Association committee conferred with representatives of the Rocky Mountain Bean Jobbers' Association, Colorado Bean Growers' Association and the field agent of the United States Bureau of Markets. The pinto bean situation was thoroughly discussed and the Colorado growers and jobbers arranged to have a representative to assist in the tariff presentation at Washington on or about October 8. On October 4, the Tariff Committee had an important meeting at Detroit with representatives of the Michigan Bean Jobbers' Association, the Gleaners and certain agricultural papers. At the end of the conference, the Michigan men arranged to send a delegation to Washington to participate in the presentation before the Ways and Means Committee of the House of Representatives on October 13 and agreed, in the meantime, to secure full data on cost of production and other pertinent information. On October 5, your Tariff Committee held a conference at Buffalo, with representatives of the New York Bean Growers and Jobbers. This group also agreed to send a delegation to Washington to present the New York data and assist generally in the fight.

California Representatives Give Material Assistance.

The committee then proceeded to Washington and sought counsel from California Representatives as to the best method of procedure. Throughout the entire work, your committee was guided by Congressman Julius Kahn of San Francisco and Congressman Hugh Hersman of Gilroy. The other representatives of California in Congress, particularly Mr. Darber of Fresno, and Mr. Osborn of Los Angeles, were very helpful. There is, however, a definite obligation to Congressmen Kahn and Hersman for the shrewd and far-sighted guidance of the former and for the untiring energy and intelligent persistent work of Hersman throughout every detail of the campaign. Congressman Kahn called a meeting of the California delegation and had the matter generally presented to them. He secured the agreement of the delegation as a whole to support the efforts of the Tariff Committee.

The committee then devoted itself to collection of data and adjustment of plans with Congressman Osborn, who had theretofore introduced a bill providing for a 2-cent tariff on beans.

The data of your Tariff Committee showed that adequate protection would warrant a 4-cent tariff. When the facts were presented to Congressman Osborn it was agreed that an amendment should be made to the pending bill, raising the tariff from 2 cents to 4 cents. Mr. Hersman then brought your committee into contact with Mr. Fordney, chairman of the Ways and Means Committee; Mr. Kitchin, the ranking Democratic member thereof; and with other members of the committee, so as to generally acquaint them with the problem prior to the formal argument.

Your committee met with the dele-

gates from New York and Michigan and finally agreed that each set would be represented by one speaker and that the speakers should all present the problem from the standpoint of the growers of the nation as a whole. All of the data at hand was gone over with these delegates, reviewed and analyzed, and a well rounded argument completed to be presented by three chosen spokesmen.

During this period, Messrs. Priesker and Hardenbrook were engaged in gathering statistical data and sounding out Congressmen. These conferences were carried on daily, so that no possible source of information or influence could be overlooked between October 6 and October 13, when the first formal presentation was to be made. On that day, the bean tariff was formally argued before the Ways and Means Committee and Congressman Osborn presented his bill with a brief summary of its purposes. He was followed by Congressman Hersman, who made some pointed remarks and the representatives of the growers of California, Michigan and New York presented their case.

American Product Discriminated Against.

The California delegation gave a complete analysis of the costs of production of beans in the Orient and in California; the total importations, noting the enormous increase during the last three years; the destruction of markets for the American bean growers by reason of this Oriental competition; the discrimination against the American bean growers by a representative of a western importing company and an official of the Food Administration; the present deplorable condition of the bean growers of California; and the general arguments to show that the public was not benefitting by the present situation and that only Japanese speculators and a few American profiteers could support the present policy as against the needs of the American public and the American farmer.

The Michigan delegate, Mr. Simpson, presented an analysis of the cost of growing beans in Michigan and general reasons for helping the farmer with the bean tariff.

Mr. Strivings, representing the New York growers, made a statement covering the situation of the bean growers in New York State. He presented figures on the cost of production and showed that they had made no real profit for years. He summarized the general arguments of policy and made an argument that was practically unanswerable.

On October 17 your committee was recalled for cross-examination by the Ways and Means Committee; and was subjected to a series of questions which brought out and emphasized all of the substantial arguments for the tariff. The proceedings were then read over and corrected by your Tariff Committee and then put to print for

the Ways and Means Committee, about November 1.

In the meantime, Congressman Hersman, together with Messrs. Preisker, Hardenbrook, had interviewed the leading members of the Ways and Means Committee and found out their attitude on the tariff question. Hours of argument were needed in order to answer objections and to make clear the points touched on in the general presentation but not thoroughly analyzed. Excellent work was done by Congressman Hersman and Messrs. Preisker and Hardenbrook in conferring with these Congressmen. It is difficult to conceive the amount of patience and actual labor involved in these interviews.

Much Prejudice Overcome.

Unfortunately a great deal of prejudice had been engendered against the California bean growers, by remarks attributed to some of our own California Representatives, to the effect that the California bean growers had caused their own troubles by refusing to sell to the Government at reasonable prices. Of course, this statement was erroneous, and was so disproved; but it took a great amount of persuasion and definite argument to make these issues clear and plain in the minds of officials who naturally listened to their own group more readily than to special pleaders.

Congressman Kahn wired Chairman Fordney, who was absent, asking that he have the Ways and Means Committee meet to pass on the tariff, advising the committee of his own personal views. Mr. Fordney replied, suggesting that he favored the tariff and, in order to save time, Mr. Kahn tried to persuade Senator Penrose, chairman of the Senate Finance Committee, to attach the tariff bill on one of the bills now pending before the Finance Committee, as an amendment, and when the bill, as amended, should come before a conference committee. Mr. Fordney, representing the House of Representatives on the conference committee, would approve a bill fixing "a good stiff tariff on beans."

The Senate Finance Committee, however, had determined to take up no new matters until the treaty was disposed of and it was therefore impossible to arrange either for a hearing or a vote with the Finance Committee. A telegram was sent to Chairman Fordney, requesting him to have his committee meet during his absence and take up the matter. Chairman Fordney then wired the senior member of the Ways and Means Committee, with whom Congressmen Kahn and Hersman conferred.

Final Report Made.

The final report from Congressman Hersman, addressed to the Tariff Committee, is as follows:

"I have just had an interview with Mr. Green who is acting for Chairman Fordney in his absence, and he tells me that it will be impossible to

get our bill for the adequate protection of domestic beans through Congress at this session. He further assured me that after conference with the committee and the House leaders it is the understanding that the matter will be given early consideration at the regular session.

"The splendid presentation that you made of this matter before the Ways and Means Committee, and the able co-operation of your colleagues, has had the desired result and while it is physically impossible to press the case to an early conclusion, nevertheless the splendid showing made in the interest of the bean men has thoroughly convinced the committee of the urgent necessity of speedy legislation. You may be assured that I will continue to exert my utmost efforts in the interest of our co-operative marketing associations."

The next session begins in December and we have the assurance that the tariff will be brought up early in the session.

Present Status Favorable.

The present status of the tariff campaign is favorable. A sufficient showing has been made before the Ways and Means Committee to warrant the tariff. Messrs. Preisker and Hardenbrook have personally seen enough of the members of the committee to know that the probable majority is sympathetic. Representatives of other states, particularly Michigan and New York, have been vitally and actively interested in the case.

Members of the Ways and Means Committee have become champions for the bean tariff. George M. Young, one of the members of that committee, wrote the Tariff Committee on November 8, 1919, as follows:

"I have also been thinking further about the bean protection bill. No one during all my experience on the Ways and Means Committee has ever made so strong and convincing a case as yourself. If any members of the committee have doubt as to the amount of protection to which your people are entitled, it is not on account of any lack of skill and thoroughness upon your part."

A splendid beginning has been made. The first and most important steps have been successfully undertaken. The Tariff Committee has presented the matter before the Ways and Means Committee and unquestionably impressed that committee with the necessity for relief.

Too much credit can not here be given to Messrs. Preisker and Hardenbrook, of the Tariff Committee, for their tactful and untiring work while in Washington, more than a hundred conferences being held with various government officials and members of the House and Senate. Every possible point of information was searched out and analyzed, and every personal phase was thoroughly covered by them, including the adjustment of certain personal difficulties that seemed almost insurmountable, such as allaying the prejudice against the California bean growers by reason of erroneous statements.

Several members of the Ways and Means Committee commented that in all their experience they had never been so impressed with the thoroughness and sincerity of a case.

The California Bean Growers' Association owes its thanks to the various Representatives mentioned, as without their support and constant and untiring service your committee would have been unable to accomplish a third of what was done.

Your committee also pays a tribute to Senator Phelan for his labor in our behalf in trying to secure bean purchases through the President and for his sympathetic attitude on all of the problems of the bean growers, as well as Senator Johnson who also assisted in the matters relating to the Finance Committee and will unquestionably prove of vital importance when the tariff is reported out.

*Our own unofficial figures.

THE biggest noise just previous to the assembling of the State Legislature last spring was occasioned by the demand for more economy in the State Government. The noise rolled away like thunder and the lightning struck in one place. It did not shake loose many of the political job holders. Practically the last bill introduced however, and put through to the Governor with a rush, was No. 1112, creating a State Department of Agriculture to consolidate the various agricultural departments and run them with \$40,000 less money than they had used the preceding two years. Curiously or not, it was a city man with no agricultural interests who introduced the bill and put it over. Probably this was the biggest cut in expenses made by the State Government to appease the demand for economy.

Well, it succeeded wonderfully in a way which was, perhaps, of no great moment to the introducer of the bill; but is of great benefit to agriculture.

Despite the cut of \$40,000 in appropriation just when all salaries, materials, and living expenses have advanced prodigiously, the State Department of Agriculture under Director G. H. Hecke, on July 22, 1919, launched a program which will multiply the saving of \$40,000, for it has already inaugurated more work than was before attempted by the separate departments.

Mr. Hecke delivered one of the chief addresses at the recent Farmers' Union convention in Oakdale.

Need Equitable Land Taxation.

Referring to his proposition that all co-operative agricultural organizations appoint delegates to an Agricultural Legislative Committee, which will sponsor laws in favor of farmers and fight vicious proposed legislation, one of its big jobs will be to secure equitable taxation. An instance of taxation which encourages large land holding and discourages intensive farming, is the Durham State Land Settlement. Dr. Elwood Mead gives figures which show that the taxes on the estate in 1918 were \$2,716. In 1919, after the estate had been subdivided and settled, the taxes on land alone, not including improvements, totaled \$9,200. On the Lott property the taxes on land alone in 1918 were \$1,006 and in 1919, after settlement, they had quadrupled. This shows how settlement increases the revenues of the State far more than the projects cost the State; but it also shows a reactionary system of taxation which the Agricultural Legislative Committee could correct. Another piece of work for this committee would be the Japanese exclusion policy. It should be handled in the interests of agriculture. "We all know that Oriental farmers have not been a benefit to our fruit markets, but have destroyed confidence in fruit packs."

But agricultural officials, such as the State Director of Agriculture, the Dean of the State Agricultural College, the State Market Director, etc.,

Agricultural Department for Less Money

(Written for Pacific Rural Press.)

should keep hands off entirely. The committee should be composed entirely of bona fide growers, including representatives of animal industry and fields crops and general organizations, such as the Farmers' Union, etc.

Agricultural Departments Consolidated.

The next Legislature should be an Agricultural Legislature, because agriculture is the biggest industry in the State. Our fruit products last year were valued at \$200,000,000 in round figures, other plant products were valued at \$350,000,000, dairy and animal products at \$200,000,000. Our gold production, during the same time, was about \$23,000,000.

It is fitting that such a large and fundamental industry as California agriculture should have a well-co-ordinated department of the State Government to protect its interests.

The State Department of Agriculture is composed of two divisions and another may soon be added. The Division of Plant Industry has five distinct offices: (1) executive; (2) plant quarantine; (3) plant pest control; (4) standardization; (5) viticulture.

The office of plant quarantine maintains inspectors at Eureka, San Francisco, Santa Barbara, San Pedro, and San Diego, who inspect every incoming boat from top to bottom. Any tourist might bring one fruit in his luggage infested with a pest or disease from which we are free. The Mediterranean fruit fly is one of the most dreaded of these. It has already spread from Mediterranean countries to Australia and Hawaii, but if it should become established in California it would cause millions of dollars of loss to our fruit growers and would cause immediate quarantine by all Eastern States against our fruits. Such pests might also come in from surrounding State by rail. The County Horticultural Commissioners are expected to prevent introduction of these by examining incoming shipments. These officials are of vital importance. Growers should cultivate their acquaintance and insist that county supervisors support their work adequately.

Cotton Boll Weevil Menace.

California is the only country of importance in cotton growing which has not been invaded by the boll weevil. Many of our growers are feeling

the need of better seed and are clamoring that quarantine restrictions be lifted so they may get cotton seed from other States. Mr. Hecke held a meeting with cotton growers in Southern California right after the Farmers' Union convention. He told them that under no circumstances could the quarantine be released; and he suggested the advisability of certain growers paying primary attention to seed growing for our own State.

Chestnuts a Coming Crop.

Since chestnut blight has killed a large proportion of chestnut trees in the East, California has every prospect of developing this crop commercially. But it will be necessary for the office of plant quarantine to keep the blight out.

Expensive Lack of Quarantine.

Citrus canker has been known in the Orient, but never reached California, due to our quarantine service. Florida did not have such quarantine. In 1911 citrus canker was imported there, and it spread like wildfire. The U. S. appropriated \$600,000 to fight it. Individuals subscribed \$180,000. The Florida Legislature appropriated \$150,000, all to fight the battle which could probably have been avoided by spending a few thousand dollars in quarantine service.

The office of plant pest control has several sections. One of these has charge of rodent control and employs several traveling supervisors.

Several insectaries are maintained in various parts of the State to collect and breed beneficial insects and parasites of injurious insects. This office maintains collectors abroad to search for such desirable aids in plant pest control. The cottony cushion scale at one time threatened our entire citrus industry. It was not such a pest in the country it came from. An investigation revealed the fact that it was controlled by vedalia beetles. These were imported to California and we no longer dread this scale. Black scale exists in South Africa, but is no menace there, so we have a man there seeking the control parasites, which will be propagated at our insectaries and liberated where they will do good. Last year, when grasshoppers destroyed many crops in the Sacramento and San Joaquin valleys, this office gave effectual aid.

The office of standardization has given California fruits and vegetables

a standing in Eastern markets which enables our heavily increasing crops to be sold at a profit where only a few years ago fraudulent packing had made Eastern markets afraid to pay a real price for our products.

The office of viticulture will apply itself to the problems affecting our grape growers, notably what to do with wine-grape vineyards and their products.

The Division of Animal Industry includes the former State Dairy Bureau, the Cattle Protection Board, the State Veterinarian's office, etc. Combination of the work of veterinarians and dairy inspectors has already worked an economy.

SUNBURNED AND WATERY TOKAYS.

(Written for Pacific Rural Press.)

Tokays frequently sunburn in the eastern Stanislaus district, where M. J. Kline has about 30 acres which yielded a gross weight of 200 tons of grapes last season. In two different seasons he has lost half of the crops this way. Faulty pruning and irrigation are blamed. It has been the practice in this region to top back the vines shortly before ripening in order to help the color, which usually is deficient. This absolutely won't do, according to Mr. Kline, who says they can beat Lodi on size of berries to overcome the handicap of poorer color. Winter pruning may help overcome sunburn of the fruit by leaving more spurs on top of the vine and shaping it to encourage more leaves over the fruit. The first ten acres planted by Mr. Kline were staked up. They made nice vines and a big crop; but the fruit burned worse than the block planted later and headed closer to the ground.

Late irrigation during hot weather is also held responsible for some burning and some waterberries this year. The ground was flooded and where water stood longest on low places Mr. Kline found the most burning and the most watery berries, which had to be cut from the lower ends of the bunches before packing. On higher ground a few feet from such spots, the grapes were fine and had good color this season. The correct practice, as figured out in this case, is to give the grapes a thorough irrigation about April and then hold the moisture by repeated fine cultivation to avoid all later irrigations.

By inaugurating a new system for the orange shippers at Porterville, deliveries of paper and other packing-house stock are being made by motor truck from Los Angeles, the headquarters of the California Fruit Growers' Exchange. Experimental deliveries of other and more bulky materials will be made.

Fig growers of Tulare county have effected a temporary organization, preliminary to the formation of a marketing association along the general lines of the California Associated Raisin Company.

FARM ANIMALS IN CALIFORNIA, DEC. 31, 1918 AND 1919.

ESTIMATED NUMBER AND VALUE.

This product makes good

IF a canvass were made of California farmers a certain percentage of them would give it as their opinion that, as a rule, no direct connected gas engine pumping unit could be expected to give any great degree of service.

And they would be honest in their opinion, based, however, entirely on their own or their neighbor's experience with a rig put together on the ranch in a more or less hit-or-miss manner—probably utilizing an engine unfitted for the work.

There is real danger to the manufacturer putting out a unit of this type that might not give continuous service for years to come.

Fill out and mail to US

Our Bean Universal Direct Connected Engine Driven Unit has made good—

—is making good every day now.

It is a success—a complete success.

It is driven by an extra heavy vertical type engine fully governed for complete safety at all times—connected direct to our Universal 4-inch pump.

It's a flexible rig and inexpensive to install and operate—it consumes but 7 to 8 gallons of distillate in 10 hours steady running.

Here's your pump if your head is not too high. Ask us about it. Use the coupon.

Berry Growers Had a Banner Year

(Written for Pacific Rural Press.)

Eight million four hundred and forty-seven thousand seven hundred pounds of berries were marketed in 1919 for members of the Central California Berry Growers' Association, as reported by Manager F. M. Wit. About one-third of these were sold directly to canners who also bought some on the open market.

Unprecedented Prices Paid.

Direct sales of strawberries to canners opened at 10 cents per pound net to the grower for field run; but as the season advanced, the demand increased and toward the end of the season growers were receiving 14 cents net, with ice cream manufacturers paying 15 cents for selected stock. On the open market where 4,245,480 pounds of strawberries were sold, the prices ranged from 17½ to 30 cents per pound.

Blackberries to the canners sold at an average of eight cents per pound; and Loganberries averaged nine cents.

These prices seem high, but they illustrate forcibly the fact that if producers do not get a fair return for their labor and investment, they will go out of business, and consumers' prices will be raised by the law of supply and demand. It also illustrates the fact that only by organization can producers permanently maintain prices high enough to enable them to keep on producing. Last year the unorganized berry-producing districts, in Southern and Eastern States, were forced out of business. The strawberry acreage of the United States, which in 1916 totaled 108,000 acres, according to Mr. Wit, decreased to 59,000 acres in 1919. During that period the Pacific States slightly increased their acreage, being generally organized. The supply in the East having greatly decreased, Eastern packers called on the Pacific States for cannery berries. Without growers' organizations here, the Easterners would have been unable to get berries in any quantity at any price and consumers would be deprived entirely.

Prohibition Increases Demand.

Prohibition has stimulated a great demand for soft drinks in which large quantities of crushed fruit, especially berries, are used. Greater prosperity of workers and their families due to high wages and inability of most of them to spend their money on booze has enabled them to pay the prices which have been received.

Raised-Bottom Boxes to Be Used.

A dry-pint container has been

adopted by the Association for use next year to conform with Federal and State legal requirements. It is of such size and shape that it can be used either in standard shipping crates or in the chests now commonly used. It has the advantages pointed out for raised-bottom boxes in our discussion of that subject while it was pending in the Legislature last spring. But it has not the chief disadvantage, which was that the empty boxes required too much space to ship economically. They could not be shipped flat and made up in the field on account of extra breakage by that system. The box adopted by the Central California Berry Growers' Association is stapled at a central factory and then flattened for shipment. Its bottom is stapled to only one side, but it has a wedge-shaped cut in the other end of the bottom which permits the wedge point to be inserted in a slot already cut through that side. It is the work of an instant to take the flattened boxes, square them up, and fix the bottom firmly in place. This box was patented last April. Each one will be stamped with the net weight and contents of berries. The berries will not be faced as heretofore. Facing is more or less deceptive and it costs extra money. Economy in handling the berries will go far toward popularizing organized marketing.

Increased Acreage in Association.

An increase of 389 acres of berries handled by the Association in 1919 over the acreage handled in 1918 indicates growing popularity. The organization in 1919 handled 109,100 sixty-pound chests of strawberries from 1022 acres, 10,281 chests of Loganberries from 164 acres, 14,674 chests of blackberries from 149 acres, and 6,940 chests of raspberries from 168 acres. These figures must not be taken to indicate average crops. For instance the acreage of strawberries includes first-year plants which bear lightly if at all, and four-year-old plants whose bearing is on the wane.

Membership in the Association includes 222 growers in Santa Cruz, Monterey, San Benito, Santa Clara, San Mateo, and Alameda counties, controlling about 96 per cent of the strawberries and 85 per cent of the bush and vine berries grown in these counties. The Association this year made no attempt to regulate selling prices. Its charge for supervising sale of the fruit on a commission basis is six cents per chest or one-tenth of a cent per pound.

Prune and Apricot Growers Must Sign Up

H. G. Coykendall, general manager of the California Prune and Apricot Growers, Inc., announces that January 20 had been set as the final date by which 20,000 additional acres of prunes and 6,000 acres of apricots must be signed by the association or it would go out of existence.

Failure of the fruit growers to give the required support to their non-profit co-operative organization, Coykendall said, would mean that the association would decline to exercise its option on growers' crops for the years 1920 and 1921. This, he said, would leave the marketing of the best crops in the hands of the independent packers and would throw the industry back into the chaotic conditions which ex-

isted prior to the formation of the association.

Emphasizing what the association had meant to the fruit growers of the State, Coykendall said, that the association had already paid out almost \$15,000,000 to its grower members for their 1919 crops, and he estimated that the association would put \$22,000,000 into their pockets when the final settlement is made.

The California Prune and Apricot Growers, Inc., is the State-wide growers' organization which was organized May 1, 1917, as a selling organization with the announcement that it represented three-fourths of the prune and apricot growers of the State.

TRY THIS FOR VINE HOPPER.

People sometimes turn sheep in their vineyards in the fall to clean up all the leaves and litter, mainly for the sake of getting rid of the leaf hopper. The theory is bad, for the sheep probably take away more fertilizer than they leave, the tramping of the ground is bad, and the vines are somewhat weakened if leaves are eaten that are yet growing on the canes.

Instead of sheeping a vineyard, people who are worried about the hopper might try this plan. Run a double furrow down each row, rake

all the leaves in it, then throw back the soil on the leaves and litter. You not only clean up the hiding place of the hoppers and so protect next summer's growth, but you get full fertilizing value from the leaves. Benefits from this reason alone may justify the method if the labor expense is not too great. That expense will depend upon the rush of other work and the efficiency and cost of labor. Anything that can add to the size and quality of the crop is likely to be profitable if the cost is not too great in the first place. To try this plan on a small strip of vineyard would show any rancher what the cost would be.

WATSONVILLE, : : : CALIF.

BULLETIN

TELEPHONE : WATSONVILLE, 176

ORTHO CRUDE OIL EMULSION GRADE "A" sets a new standard of quality for winter spraying for prunes and apricots with an individuality that is distinctly its own, for the outstanding features of Ortho Crude Oil Emulsion Grade, "A" are:

FIRST—Its a PERMANENT Emulsion and not made to be used as soon after received as possible, for it will keep over a great length of time and hold its emulsifying quality as good as when received.

SECOND—Ortho Crude Oil Emulsion Grade "A" will mix with the hardest kind of water without any decomposition and the water has no apparent effect of any consequence on the emulsion.

THIRD—Ortho Crude Oil Emulsion Grade "A" is compatible with lime-sulphur solution and other sprays can be used with it to advantage in the control of insect pests.

These three features are the results of considerable experimentation by Mr. W. H. Volck, our Director of Research, and we believe it to be a notable achievement to take a spray of such high quality as our Ortho Crude Oil Emulsion has been and add to it these features.

Ortho Crude Oil Emulsion Grade "A" is processed from natural gravity crude oil and the results of that processing insures:

1. PERMANENCY.
2. COMPATIBILITY (mixes with hard water, lime-sulphur solution, etc.).
3. KILLING QUALITIES.
4. GREAT PENETRATION.
5. EASE OF APPLICATION.
6. SPREADING QUALITY.
7. LOW COST.

FIRST—PERMANENCY. Ortho Crude Oil Emulsion Grade "A" is guaranteed to keep for two years without decomposition. We will replace, at our expense, any crude oil emulsion that shows any sign of decomposition during a period of two years.

SECOND—COMPATIBILITY. Ortho Crude Oil Emulsion Grade "A" is compatible with a great many different kinds of spray, such as Lime-Sulphur Solution and Bordeaux Mixture. This opens up a field of combination sprays which reduces the cost of application of spray; it insures better results by the use of a combination of two sprays such as Ortho Crude Oil Emulsion Grade "A" and Ortho Lime-Sulphur Solution.

Ortho Crude Oil Emulsion Grade "A" is not decomposed by the hardest kind of water and will mix in mineral water as well as the softest spring water without any change. If desired, 4 to 6 pounds of caustic soda can be used for each 100 gallons of diluted spray for killing moss.

THIRD—KILLING QUALITIES. Ortho Crude Oil Emulsion Grade "A" has great killing qualities for it controls San Jose Scale and Brown Apricot Scale, and as a general insecticide is most effective. And in addition

Ortho Crude Oil Emulsion Grade "A" is sold in barrels and the gallons determined by weight, so that each barrel will have the exact net gallons stenciled on it instead of the barrels averaged, as is oftentimes done.

Ortho Crude Oil Emulsion Grade "A" contains 66 per cent natural gravity crude oil.

W. H. VOLCK, Director of Research.

to this it has a decided stimulating effect on the trees, which makes it one of the best winter sprays to use on Apricots, Prunes, Pears and Apples, during winter as a dormant spray.

FOURTH—GREAT PENETRATION. Ortho Crude Oil Emulsion Grade "A" is made up of a large number of very minute particles of oil which have been emulsified to insure its fine state of subdivision that it might penetrate into insects. Its fine state of subdivision is, perhaps, finer than any other emulsion that has ever been marketed. Under the microscope the high quality of Ortho Crude Oil Emulsion Grade "A" is readily demonstrated. The microscope shows that Ortho Crude Oil Emulsion Grade "A" is made up of exceedingly fine particles, and those particles are permanent in their emulsified condition—unlike the breaking down of fine particles into larger particles in many so-called emulsions that are on the market.

FIFTH—EASE OF APPLICATION. Ortho Crude Oil Emulsion Grade "A" flows through a pump without any corroding effect, and more spraying with this Ortho Crude Oil Emulsion Grade "A" can be put out in a day than with any other spray. The emulsion will flow readily from the barrel and only needs to be placed in the spray tank and mixed with water to form a perfect spray mixture. Any other spray can be used in conjunction with it easily—lime-sulphur is added after the crude oil emulsion has been mixed with the water. Large quantities of caustic soda can be added to the emulsion without decomposition.

In spraying with Ortho Crude Oil Emulsion Grade "A" three points should be remembered:

First—Use the emulsion of proper strength—usually 12 per cent actual oil.

Second—Apply at proper time; i. e., while the trees are dormant from January 1st to time of visible bud swelling.

Third—Apply with great thoroughness so as to cover all twigs and branches perfectly. The tree should be dark brown to black when the emulsion has dried down and the branches and twigs should be uniformly coated. In doing this it might be necessary to apparently waste considerable of the spray, but the increase in cost will be compensated by better results.

SIXTH—SPREADING QUALITIES. Ortho Crude Oil Emulsion Grade "A" being finer subdivided than others, will cover more surface; and not containing any chemicals which will react with hard water, the emulsion will spread over a larger surface. It has been a usual experience with people that have had considerable experience with emulsions that 25 barrels of Ortho Crude Oil Emulsion will cover about the same surface as 32 barrels other makes.

SEVENTH—LOW COST. The cost of Ortho Crude Oil Emulsion Grade "A" is very moderate. On account of large quantity production of Ortho Crude Oil Emulsion Grade "A" we have been able to give an emulsion of great quality at a cost which is not excessive to the Orchardist.

Pruning for More Fruit and Less Wood

(Written for Pacific Rural Press by D. J. Whitney.)

For decades past, or ever since fruit growing by Americans got a good start in California, there has been a standard method for pruning our leading deciduous fruits, like peaches and apricots. Now, amazing as it is, we find from the source of greatest authority upon the matter, the College of Agriculture, that we have been all wrong and that we should alter our pruning methods. "Once seeing is worth a hundred times telling." Through the Farm Bureaus of the State, demonstrations are being given to peach growers and others interested. This is a report of things seen at such a demonstration.

Deciduous fruit trees are of two kinds. The first, represented by the peach and apricot, will make a good shoot and strong branches, or laterals from it, all in one season. The other type, represented by the apple and pear, makes the shoot one year and the laterals from it the next year. The demonstration described and rules indicated, applies to the first type of tree. In certain ways they will apply to the second type.

Treatment of the Young Tree.

The young tree comes from the nursery. If its top will allow it, leave three good, well-spaced side branches to form the main frame of the future tree. Cut the ends back a little. Remove other shoots, but do not cut too close to the trunk. Leave a very short stub, for close cutting may destroy the blind buds in the bark, which should send shoots out next year to shelter the bark and to provide food for the plant.

The earliest spring growth will come from the upper buds on the three leaders left and these new shoots will grow faster and stronger than all the other shoots. If the tree when planted is one-sided or there are not three good leaders, cut back to a switch, then when spring growth gets a good start select the three best and nicest spaced sprouts and pinch back the ends of the others. Also, if three leaders have been left, pinch back any shoots that are likely to grow too strong for them. Certainly pull off any water sprouts.

Now, these smaller shoots give strength to what they grow on. Take a soft, new, quick-growing, light green shoot and examine the leaf very closely and it will be watery and the valuable green particles in it will be few. Pinch off the tip of the shoot and the leaf color will darken quickly. Those rich dark leaves will have a multitude of green particles. Each will be making food from air and water, with the help of the sunlight, and that food will flow into the trunk or branch near the leaves and make it strong, thick and rich. Therefore, these side shoots are very good and if they are too quick growing they can be pinched back.

The First Winter.

By next fall you should have a nice little tree, with three good long branches ready to start a frame, all side shoots having been kept back by summer attention so that no heavy cutting needs to be made, and the tree will also be well balanced. You can cut back just a little toward the top of each of the three shoots, leaving each about the same height and cutting to a lateral. The big change over the old system is that these leaders are not cut away back.

They will NOT therefore send out a bunch of shoots where they have been cut, but will make a nice, moderate growth the next season. If they have branched about shoulder high during the summer, all right.

If they have grown too long without branching, they can be cut back to laterals about shoulder height in order to make them form the necessary main branches, provided they have not branched too much. Beginning from shoulder height a tree can have five to seven branches all right. For the fine stuff coming out along various parts of the tree, leave a good supply of it and leave it pretty long. It will supply food next year, thicken

the branch it grows on, and protect the bark from sunburn, and probably bear a good deal of fruit.

Makes Bark Very Cool!

Actual tests have been made at the Davis farm to see what this bark protection by twig growth did. Where short shoots had come from the trunk of the young tree, the leaves cooled the trunk 15 degrees, so that the temperature of the bark was only about 88 when the outside temperature was 103 or 104.

Proof of the Padding.

There is a 40-acre orchard in Fresno county, owned by Geo. Feaver of Fowler, that has been started by this system. This summer, in its third season, it produced 25 tons of peaches. A thing like that is a strong commendation of the system, for it will beat out the old style pruning as much later as it does when young. But look:

Louis P. Bizant of the same district had an old orchard started in the ordinary way, but wanted to get the advantage of new methods. In order to play safe both ways he pruned half of it as usual. The other half he pruned according to the new methods as well as they could be applied to the conditions, and took off four boxes more of fruit per tree with the new style of pruning than he got off the remainder, and left his trees in A-1 condition.

The Theory of the Thing.

Here is the theory of the thing. If you cut back heavily in the old way you do several things: you make a whole lot of vigorous shoots come out the next spring and these are wood growths, not fruit growths; you leave big wounds in the tree into which rot comes easily so that few old peach orchards can be found which are not nearly ruined. (This is true with lots of other fruits, too.) You also remove a lot of plant food that the leaves have worked to construct and the soft, quick-growing shoots that such heavy cutting causes to come out are not as good in gathering sugar and starch as the greener leaves and slower growths are. Therefore, a tree pruned with little cutting can bear heavier crops than old style trees without feeling the strain.

More Explanation.

There are certain facts about spacing branches, letting in light, and so on that everybody knows. Otherwise, the main idea in the new system, as far as trees of full growth is concerned, is to leave fruiting branches long and with plenty of buds. When this is done the sap will not rush to the top, as it does when a bunch of suckers comes out at a heavy cut, but the sap will run out at the little shoots all along the stem and there will be fruit wood growing well all the way down to the crotch. As it is, when a bunch of Orientals get through an orchard, everything in fruit and new growth runs to the top and the tree gets higher and higher and harder and harder to manage.

The difference in this system of pruning will be clear in giving an example. Mr. Fletcher of the University Farm, who conducted the demonstration, took an old style tree with a bunch of shoots on top, as usual, and instead of cutting them down to within a foot of the old wood, he removed a very few of them and a little of the wood that was growing along the leaders, and removed the top of the shoots about a third of the way down, cutting to a lateral, a thing that would not cause sucker growth to come out next year and leaving three times as many buds on them as a bunch of Oriental pruners would leave.

The following winter no hard cutting will be needed. These old shoots, then two years old, can be cut back to a lateral at about the same height as before and the same thing can continue indefinitely.

Most important of all, the system can be applied to old trees almost as well as to trees started right.

The **FARMER** says—
"for stumping
genuine **GIANT**
has no equal"

From recent letters of ten farmers who have used Giant Powders for Stumping we make these extracts:

"1. Your Giant Farm Powders shoot the roots. 2. They have wide breaking power and less bad gases than others. 3. I get the same excellent results from them every time. 4. They are always uniform. 5. I used eleven tons and wouldn't have any other make. 6. I want to sell a lot of other powder that I have because Giant does the work much better. 7. Genuine Giant can't be equalled. 8. I don't have to use so much powder when I blast with Giant. 9. You know what we need for stumping. 10. I save money by using Giant Powders."

Write today for our free book, "Better Farming With Giant Farm Powders." It tells how to save money and get better results in stumping, ditching, tree-planting, etc.

Banner Apple Crop at Watsonville

(Written for Pacific Rural Press by W. H. Schrader.)

Apple growers in the Watsonville district have had their banner season this year. They have just harvested the largest crop ever grown in the valley. Part of the crop is still in cold storage, so it is impossible to give exact figures at this time. A. W. Tate, inspector for the Standardization Department, a conservative authority, estimated that shipments will total this year three and a quarter million boxes as against two and a half million boxes last year. The price for fancy apples at the beginning of the season was \$2.00 per box. It is now \$1.85 for fancy and \$1.50 for B grade. The growers will average round \$1.60 per box. About 60 per cent of the crop will be shipped and about 40 per cent went to friers, canneries, cider and vinegar works. The latter brought about \$40 to \$55 per ton. At these figures the total crop will bring over \$7,000,000.

There was an extraordinary heavy setting of fruit on the trees this year and this together with the dry season and the difficulty of getting the soil into good tilth, caused a very heavy drop. However, the windfalls brought such good prices at the driers and canneries that the loss on this account was slight.

The decline from the opening prices was due partly to delayed shipment

bringing the apples into competition with those from the northwest and the east and partly to industrial unrest and agitation against H. C. L.

While labor was scarce and high, none of the crop was lost from lack of help. While some of the growers became frightened early in the season and paid higher prices the average was about 7½ cents per box for picking and 6 cents per box for packing. These were the prices paid by Rodgers Bros. who are among the largest growers and shippers in the district and who run a drier as well. Mr. Rodgers stated that at these prices, workers earned \$5 to \$10 per day, and even more.

The Rodgers Bros. orchard receives the best care and irrigation. Just what a good apple orchard can and will do with proper care and handling is shown by a block of mature Newtown Pippins in their orchard which turned off an average of 25 lug boxes per tree. Of these 25 per cent went to the drier, 12 per cent were grades and the balance fancy. If you wish to know the return per acre, allow 60 trees to the acre, 1¼ packed boxes to each lug and at the above prices figure it out for yourself. If we gave the results you would probably have to check up the figures anyway before you could believe them.

Why Redwood Grape Stakes?

(Written for Pacific Rural Press.)

Grape stakes are made of redwood for the simple reason that redwood will remain in the ground for long periods without rotting. There are, though, two kinds of redwood—coast redwood and mountain, or Sierra redwood. Both will resist decay, but

otherwise there is an immense difference between them. The coast redwood is tough and will stand a big strain; the mountain redwood is brittle and will snap off easily.

Consequently a person will see a pile of coast stakes and think they are too thin and weak to be worth much, and he will see a pile of mountain stakes and think they are fine, they are so straight and thick, but actually one will be about as valuable as the other. Any difference is likely to be in favor of the coast wood.

The difference in woods is easy to discover. Coast redwood has a very strong grain so that when it is split, it is likely to split clean for the whole length of the wood; each fiber holds together if it can and if it has to break it will splinter strongly. The fibers of the mountain redwood are so weak that the wood is hard to split true. Instead of splitting all along the grain, the fibers are likely to break sideways very easily. On split posts, for example, it is usual to find shoulders on one side of the other where the grain has broken. One wood will split, the other will break in chunks. The one that splits is tough and strong; the one that will not is weak and brittle.

Whether for fence posts or grape stakes, coast redwood is preferable unless the other is so thick as to overcome its natural weakness. If not much side strain is to be put on the mountain redwood, it will prove very durable and satisfactory.

Several years ago grape stakes were worth only 4½ and five cents. Now they are ten cents each.

IS RHODES GRASS PRACTICAL?

To the Editor: Would like to ask your opinion in regard to Rhodes grass, whether it is a pest and would be hard to eradicate when once planted. Is it as good stock food as advertising circulars seem to indicate. Feed through the summer here is very scarce, and some grass that would stay green throughout the summer would be very welcome.—W. N. R., Watsonville.

We have recently printed all we know about Rhodes grass but would like to hear from any subscribers who have had experience with it. Our impression is that it makes good feed, but not so rich in nourishment as alfalfa; that it will thrive on less water than alfalfa, but will not stay green throughout the summer except on moist land; and that it will not be hard to eradicate.

[This is one of a series]

Here and There in the Fruit Business

Frosted Grapes Spoil in Transit.

A little experiment in Tulare county tested the keeping qualities of Emperor grapes after the severe freeze of the last week in October. Considerable argument was used at that time as to the degree of frost injury necessary to prohibit the packing of this fruit. As it required several days for slight injury to develop, Commissioner Chas. Collins feared to draw the line too tightly at first, but placed in cold storage a sample crate taken from a lot which was being packed for Eastern shipment. At the same time, he had packed for experimental purposes a crate of more severely injured fruit. These crates were placed in cold storage October 30 and were opened 30 days later. Both were in very bad condition, the more severely injured fruit not being edible at all, while 90 per cent of the better grade had stems covered with mold and there was much soft fruit. Mr. Collins' office is also conducting some experiments with grapes packed in drums under various conditions, but these will not be opened until the holiday season, as they are supposed to keep until that time in many cases when shipped.

Eucalyptus Planting Paid.

Some years ago there was lots of talk about the fine outlook for eucalyptus planting as a source of valuable hardwood; and the proposition for a time rivalled oil wells as a get-rich-quick scheme for promoters. Taking a chance on the outlook, the Mineral King Fruit Company, near Visalia, made some extensive plantings on their ranch, and although the bonanza profits from hardwood did not develop, the trees have been quite a success from a stove-wood standpoint. They are in the delta where moisture is plentiful and the trees needed no attention after getting a good start. Seven-year trees yield 35 and 40 cords of wood per acre, worth \$10 per cord, standing. Growth after cutting is very rapid so that in five years this yield is duplicated, utterly without attention or risk of bad seasons or other dangers. While other crops might have been selected which would have paid greater profits, the eucalyptus account is balanced with black and not with red ink.

A New Fig Bulletin.

Maintaining that Fresno is the best fig-producing center in the world, and giving news and data on the industry, the third installment of the Fig Bulletin of the Fresno Chamber of Commerce is now in the hands of the printers and will be ready for distribution shortly. About 5,000 copies of the fig bulletins have been issued by the chamber since the first of the year. The production for 1919 is given at 20,000,000 pounds, which is an increase of 1,000 tons over 1918. The bulletin further declares that 80 per cent of this fig production is grown in Fresno county. By far the greatest amount of the fig production listed is the Adriatic variety, 14,000,000 pounds being the production for this variety, against 3,000,000 each for Smyrna and Black Mission figs. The Smyrnas brought the best price, however (20 cents), while the Adriatics brought 15 cents and the Black Missions 13 cents.

Wrap Young Fig Trees.

Merced County Horticultural Commissioner Arthur E. Beers advises the following: A frost severe enough to injure young fig trees is possible at any time now and young trees should be wrapped at once. Freezes early in November have often proved more injurious than colder weather later in the season. Trees usually freeze worst just above the ground, so that this part of the trunk should be well protected. Injury to the tips is not serious, but injury to the trunk and main branches is an unfortunate setback for the tree. Cornstalks and milo maize stocks are the best materials to wrap around the trees.

Watch Oriental Pruners.

If a man can do his own work in those things that require care, he is

frequently better off. Take pruning, for example. Put an Oriental in vineyard or orchard and show him exactly what is wanted. He can learn how to do it all right and will work a few trees or vines nicely. Then his old way will gradually work back into his head and he will begin to combine his method with your method. Soon it will be half one and half the other, and in a very short time afterward all his way and none your way and he will not know it. Otherwise, you can stay right close the whole time, for habit will be stronger than any teaching. Consequently, contracting work by a bunch of Orientals is one of the best possible ways to keep from adopting any improvements.

Bark Protection for Young Trees.

When the trunk of a young tree gets too large for a tree protector and the latter is removed, the bark will be very delicate and easily hurt by sunburn, even in winter, so it should be whitewashed. A good whitewash for the purpose is made of seven pounds quicklime, three pounds sulphur, and one pound salt. It can be put on as a spray or with a brush. Also, in pruning a two- or three-year-old tree and taking out a big branch (which will never have to be done with the new style pruning found so successful by the College of Agriculture), the bark behind it and formerly shaded by it will be very tender and this whitewash will do a great deal to protect it from sunburn, gum, and borers. The trunk of a young tree just set out should also be whitewashed, as the bark of that will be tender on account of the pruning given to it.

Ship Only Clean Fruit.

January 1 is the date set by Solano County Horticultural Commissioner Frank Owen, after which a quarantine on all fruits and vegetables violating the standardization law will be vigorously enforced. Mr. Owen has been giving dealers time to clean up their stocks without drastic measures; although one shipment of diseased apples was ordered to be sorted at the expense of the shipper. A carload of scabby potatoes was seized December 12, and released on promise that no more would be received.

Ornamentals Held at Pasadena.

Inspector Thorndike of Pasadena has on a number of occasions during the past few months refused shipments of ornamental stock from Eastern states or required their treatment for pests. He has refused currant bushes from New York State because of the White Pine Blister Rust quarantine. Shipments carrying mealybugs were intercepted from Pennsylvania and New Jersey and a box of roots from Ireland were received through the mails and refused entry.

Red Scale Infested Fruit Intercepted.

Three lots of lemons infested with red scale have been stopped by District Inspectors in Los Angeles County recently. W. E. Landon held up 25 boxes consigned to a packing house in the San Dimas district. B. R. Bowles turned back one packed box destined for San Fernando Valley through the parcels post. J. R. Hyans stopped the sale of 40 packed boxes of lemons brought into the Long Beach Market. The latter two shipments originated outside of Los Angeles county.

Coming Horticultural Examinations.

Director Hecke announces examinations to furnish a list of eligibles for the position of County Horticultural Commissioner, to be given by the State Department of Agriculture, as follows: 1. At Independence, Inyo county, January 13, 1920. 2. At San Luis Obispo, San Luis Obispo county, January 15, 1920. Applications must be filed in Sacramento at least seven days prior to the date announced above for the examination.

Revenue officers have seized two thousand gallons of wine in a series of raids here in Napa recently.

Time to Prune Grapes

[Written for Pacific Rural Press by D. J. Whitney.]

The labor problem enters into this proposition, as it does now more than ever before in every question of ranch policy. If men can be kept working all winter the labor supply in a district is likely to be good. If they have to loaf too much, they are likely to head elsewhere, making a deficiency of help later, and higher wages than a rancher is likely to be able to pay if he expects to come out square. From the labor side of it therefore, it is advisable to start vineyard pruning early and so avoid the danger of having the work done too late in the spring.

From the standpoint of the vine several things are to be considered about the time to prune. For practical purposes pruning can begin without danger whenever the canes are fully dormant. Otherwise the later the pruning is done, the better for the next crop, particularly with Muscats. This has been proved conclusively by experiments. Muscats also will stand later pruning than Thompson's. They can be pruned with no special harm after the sap has started to flow well in the spring, while Thompson's should be all pruned before that time.

Vines are not completely dormant

as soon as the leaves fall off. In a mild fall they may be nearly so, but when a sudden hard frost kills the leaves before they are ready to fall and then a rain knocks them off, the canes are likely to be well supplied with sap and sugar, a great deal of which will gradually find its way back to the trunk and roots in preparation for next season's growth. If the canes are cut off too early, this food is lost. If it is given a chance to get back to the roots, it is saved; otherwise it is doubtful.

Normally, the vines are completely dormant for pruning purposes during January and the latter half of December, when a man can prune without fear of trouble.

If vines are pruned while the sap is flowing vigorously and a hard freeze comes, it will do far more injury than if the bleeding were not taking place. A. E. Way, viticulturist at the Kearny ranch, says he has seen big vines cut to the ground by a hard frost at such a time, when they would not be injured a particle if they were not bleeding. Otherwise the sap that comes freely from a cut cane in spring contains little plant food and the vines do not seem to feel its loss.

ing it, again force it to the ground. About forty horse power will be required to operate the fan.

Two of the finest orchard properties in the Oakdale district changed hands last week for around \$100,000 each.

Carlots of apples from the Paradise district of Butte County were shipped this season for the first time. Fifteen carloads had been shipped before mid-December.

Figures compiled by the railroads as of December 10 show that of oranges to date the total consignments from Central California having been 2,706 cars, as compared with 2,037 cars to the same date last year.

The sale of 1,000 tons of dried peaches, the surplus of last season's record crop, has been authorized by the directors of the California Peach Growers' Association. The large crop of the past season found a ready market, and was sold in record time.

Reports from Butte County state that the orange crop this season will exceed that of last year. The crop appears materially heavier where a cover crop was grown, or where weeds and grass were allowed to remain unmolested after the spring plowing.

Sixteen carloads of honey have been shipped out of Imperial this season and more will follow. This will make up the average crop for the Valley. A carload of honey contains from 300 to 350 cases of 120 pounds net. There are estimated to be 47,000 colonies of bees in Imperial County apiaries now.

Sir Percy Fitzpatrick, one of the leading orange growers of South Africa, author and traveler and prominent in South African politics, was a visitor in Porterville recently and spent some time conferring with local packing house men, exchange officials and shippers on methods of growing, packing and marketing oranges in vogue in California.

PRUNING DEMONSTRATION AT PASO ROBLES.

To the Editor: On Tuesday, December 16, Harold E. Alley, Horticultural Commissioner for San Luis Obispo County, gave a demonstration of the new system of pruning deciduous fruit trees on H. G. Merrill's ranch near Paso Robles. About 60 persons were in attendance, mostly almond growers around Paso Robles. All took a lively interest and kept Mr. Alley busy with their questions.

Most of the trees pruned were almonds, but other fruits were also taken into consideration. Mr. Alley has had wide experience in this sort of work, and in addition has recently received personal instruction from Professor Tufts at Davis.—H. G. Merrill, Paso Robles.

Top Dressing Talks, No. 4

Haul the lighter load! Save money on freight, hauling, handling and storage by using a fertilizer of the highest analysis.

Arcadian Sulphate of Ammonia contains 25 1/4 units of ammonia, all soluble and available, one-third more plant food than any other nitrogenous top dressing.

ARCADIAN Sulphate of Ammonia

Its fine, dry condition means a further saving of time and labor in top-dressing orchards, truck crops, grass, grain, corn, cotton and tobacco. It is the great American ammoniate.

Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past.

Arcadian is the kiln-dried and screened grade, made fine and dry for top dressing purposes. Ammonia 25 1/4 per cent guaranteed. Made in U. S. A.

HORTICULTURAL JOTTINGS.

Oregon apples were badly damaged by the recent freeze.

The Palo Verde Valley is to be tried as a possible date growing district.

The campaign for increased acreage to be signed up in the prune and apricot association is to close Jan. 20.

Oroville claims the distinction of shipping the first olives from California to Eastern markets this season.

Orange splits having been banned from shipment by the Standardization law, growers at Lindsay are starting a concerted movement to find the cause and remedy.

A million dollars worth of wine was announced to be shipped from San Francisco to the Orient December 27. It is said to be the largest single shipment of wine ever made in the world.

It is estimated that the orange growers of the Redlands district have received, during the past year, more than \$6,000,000. There is every indication that the crop for the coming year will be even larger.

Heavy fogs which rolled into the Porterville district from the high Sierra saved some early oranges from damage by the unusual cold. The fog blanket protected the trees from rays of the sun until the cold moderated each day.

Women orange pickers are in demand in the Lindsay district. Workers are paid 6 1/2 cents per box and a bonus of 1/2 cent per box if they stay the entire season. Light housekeeping rooms are furnished at reasonable rates.

To provide for adequate space for the increased size of the National Orange Show, to be held in San Bernardino on February 13 to 23, the exposition directors have leased Urbana Park, a big pleasure resort, and the construction work will begin at once. Ten acres will be covered with tents.

The Home Industry League has warned the olive producers and packers of California that prompt action must be taken to prevent injury to the olive industry from a sensational poisoning story being circulated through the East. In a letter to the olive men President Baldwin Vale of the Home Industry League urges that vigorous propaganda be started to combat the impression that the ripe olive is dangerous as food.

C. K. Towt, a widely-known orange grower of the Lindsay district, has a new plan for protecting a ten-acre orange grove from damage by cold. He is constructing a tower about forty feet in height, to be centrally located in the grove, on which is to be a fan which will draw the cold air from about the trees and after warm-

What One County Farm Bureau Is Doing

(Written for Pacific Rural Press by R. D. McCallum, Modesto.)

The adoption of plans for a statewide membership drive, the formation of a Tri-County Marketing Association, passage of strong anti-Japanese resolutions, ratification of the National Farm Bureau constitution, appointment of W. H. Heileman of Willows as permanent secretary of the State Farm Bureau, and unanimous re-election of George H. Sawyer as county president were some of the important actions taken by the members of the Stanislaus county Farm Bureau in their sessions on December 11th at Modesto.

The day's activities were divided into a session of the State Regional Directors of the California Farm Bureau Federation and a meeting of the marketing committees of Merced, Madera and Stanislaus counties in the morning and the annual meeting of the Stanislaus County Farm Bureau in the afternoon. This session was featured by the election of officers and addresses by State President W. H. Walker of Glenn county and Dean Thomas Forsyth Hunt of the College of Agriculture, and by reports of the farm bureau accomplishments submitted by various committee chairmen.

The morning session of the regional directors of the State Federation was the first meeting of that body since the formation of the California Farm Bureau Federation at Berkeley on October 23rd. At this meeting the machinery of the Federation was put in motion. Probably the most important matter taken up was the appointment of W. H. Heileman of Willows, Glenn county, California, former Farm Advisor for Glenn county and prominent farmer, as secretary of the Federation. Mr. Heileman has been intimately associated with the farm bureau for the past five years, and is well qualified to assume the duties of that office.

Dean Hunt of the College of Agriculture gave a very interesting address on the "Trend of Agricultural Prices," pointing out the rise in the price of farm products since the war and using Bradstreet's index of prices, showing the difference in the purchasing price of the dollar before the war and at present. Commenting on the Farm Bureau, he said: "I have spoken of the Farm Bureau movement as in my judgment the most representative and effective means of concerted action among farmers of the United States. It is not only concerted, it is representative. The Farm Bureau movement is built up on the principle of democracy. There are four or five hundred farm centers and they have no power to do anything except what has been delegated to them by you—they are your representatives. Each farm center elects its director, and its director represents its center. It is therefore truly representative of the farmers."

The reports of the farm bureau accomplishments during the past year, as submitted by the various committee chairmen, were significant indications reports showing that the County Farm Bureau as an organization has been active in all phases in agriculture and has not neglected economic matters. Three departments of the Farm Bureau alone; namely the wool pool, auction sales and fire protection, saved the farmers of this country over \$95,000 during the past year. A brief summary of the work of the Farm Bureau, as outlined by President Geo. H. Sawyer, is as follows:

1. Co-operated with the Turlock Irrigation District relative to irrigation and drainage problems.
2. Called mass meeting of farmers at Turlock relative to the marketing of 1918 bean crop.
3. Saved over \$74,000 this year for the farmers as the result of the fire-fighting organization.
4. Co-operated with the Bean Growers' Association in an effort to secure a tariff on Asiatic beans.
5. Co-operated with the Stanislaus County and Turlock Boards of Trade in an endeavor to discourage the renting and selling of land to Japanese.
6. Farm Bureau instrumental in urging and supervising construction of telephone lines in Hickman, Waterford, Roberts Ferry and Montpelier districts.
7. Farm Bureau has stood for better roads in rural communities and in many districts have co-operated with the Board of Supervisors of county to this end.

8. County Farm Bureau active in backing up county fair and urging county fair ground at county seat.

9. Farm Center at Patterson conceived the idea of the Patterson District Fair.

10. Published Farm Bureau Monthly, giving timely hints on agricultural subjects.

11. Committees of Farm Bureau appeared before legislature and Governor in behalf of the passage of appropriations affecting farm bureau work.

12. Requested action of congressmen and legislators on the bean tariff, wheat dockage, Japanese questions and appropriations.

13. As a result of the selected dwarf milo seed introduced into the county, milo planting has spread over the entire county.

14. As a result of the honey sorghum campaign for silage and syrup purposes last year, a sorghum mill was built at Hughson this year.

15. The farm bureau took the initiative on the wheat dockage fight, to secure compensation on valuable dockage.

16. Constructed seven farm bureau silos of the wood hoop type.

17. Farm Bureau initiated the second wool pool that has been held in the county and in co-operation with the Farmers' Union shipped a carload of wool to Boston, which netted the farmers 34 cents a pound while local buyers were only offering 35 to 40 cents per pound.

18. Organized auction sales for livestock at Modesto and Turlock in the county. To date, 77 carloads, or 5577 hogs, have been sold for \$182,850.22. It is estimated that a saving of 10 per cent was made to the farmers of \$18,285.02.

19. Farm Bureau has taken lead in advocating construction of a livestock sales pavilion, for purebred auction sales of livestock in conjunction with the county fair building.

20. Organized Swine Growers' Department of the farm bureau.

21. Tested monthly cows for the dairymen through the cow-testing department of the farm bureau.

22. Held four poultry demonstrations with a total attendance of 233.

23. Co-operated with the local labor bureau through the farm bureau.

24. Two of the farm centers in county are planning to build community halls.

25. Held a mass meeting of fig growers of the county to discuss the various problems relative to the fig industry.

State President W. H. Walker, in his address to the members of the farm bureau, stated that in the farm bureau the farmers of the nation had a movement of tremendous force which is now being crystallized into action. Capital represents but a small minority of the people and organized labor includes only 2.5 per cent of those in gainful occupation, he said, but nevertheless they were controlling all legislation while the farmers, representing 34 per cent of the people, were carelessly staying away from the council table that directs the national affairs.

The following officers were elected for the ensuing year: Geo. H. Sawyer, President; R. W. Sweetland, Vice-President; Geo. T. McCabe, Secretary-Treasurer; C. A. Hilton, Modesto, W. F. Beard, Modesto, D. J. Walton, Turlock, R. H. Frazer and L. S. Hadley, Directors-at-large.

Elmer Lamb of Ceres, who is leaving the county, was named honorary director-at-large in appreciation of his services.

PROTECT YOUR TOOLS FROM RUST.

Nearly every man owns at least a few tools, such as chisels, hammers, augers, saws, wrenches, files, etc.

These tools as a rule are infrequently used. They are often kept in places where they are exposed to moisture and consequently rust. Almost all tools with the possible exception of hammers are rendered less efficient by rust.

When it is so easily prevented, it seems strange that steps are not taken to do it. It is well worth while to save the tools as every one knows that has had occasion to buy any new ones lately.

Probably the best tool protector and carrying case for a small kit may be made in the shape of a roll from a piece of pyroxylin coated fabric having a napped or fleecy back. This material is thoroughly waterproof, and if care is taken in wrapping the tools in it after use, it will prevent moisture from reaching them and no damage from rust can occur.

The material is durable and will last a long time. It is obtainable at many department and general stores where it is sold under the general name of leather substitute. There are many leather substitutes on the market sold under various manufacturers'

trade names. Practically any of them will answer very nicely for the use specified.

SHORT COURSES FOR BEE-KEEPERS.

The commercial beekeepers' short course at University Farm November 10-22 drew an average attendance at each session of about 100. Behavior of bees, bee diseases, beekeeping practices, and local bee problems were studied enthusiastically. Manager Justice of the California Honey Producers' Co-operative Exchange appeared Wednesday evenings to tell the students what the Exchange has done, and why.

The almost complete failure of the honey crop in the San Joaquin Valley the past year caused a loss of interest among the producers of that territory, as is usual. The attendance at the Fresno course was smaller than in former years, but those taking it were keenly in earnest and determined to make the most of the instruction given, many of them being among the largest producers of honey in the State.

A very large attendance and close attention greeted the lecturers at Riverside, this point being the center of honey production in Southern California. Many lady students were noticeable here, and several beekeepers followed down from Fresno to more thoroughly absorb the instruction given by hearing it a second time. This fact was also noted at San Diego, the last station in the course, where a very large attendance was registered, when the scattered settlement of the county is considered.

The increasing number of women students of beekeeping during the past few years is a fact that impresses one. San Diego county, especially, has a number of successful women beekeepers who are producing honey on a commercial scale.

The main thought sought to be impressed on the minds of commercial honey producers by this course of instruction is better bee-keeping to secure a profitable force of bees earlier in the season. Thousands of tons of honey go to waste each year from the

early honey-producing plants, such as manzanita, orange and black sage, simply because there are not enough bees to secure it. Much of this can be saved by a better system of wintering, that will give a big force of worker bees in time to take advantage of these early honey-flows.

This Folder Tells You How To Make Your Idle Land Earn Money

This is the day and age when you should make every foot of land produce profits for you. If you have any size tract ranging from 50 to 5,000 acres in the Western States that need development you should send for this book at once. It tells you the way to develop your property through the use of Hydro-Electric plants, gravity irrigation systems, pumping plants, grading, and buildings; in fact, it points out the various essentials that are necessary to make your ranch a producing property.

Now is the time to act, so that you can get a crop from your land next year. It is a certainty that crops will bring good prices next year, so take advantage of this condition and get your land under cultivation now. Write today, stating location of land and number of acres.

AMMONIATES

CALIFORNIA WILD CLOVER.

To the Editor: I send a little sample of a red clover which grows naturally on my ranch. I wish to know its correct name and its feeding value, both as pasturage and for hay as compared to alfalfa. Do you consider it as good as burr clover for dairy cattle and hogs? I wish to sow some and would like to know how much seed per acre to sow and if it requires a nurse crop. After taking the first crop for hay, could I get a second crop by irrigating? My land is overflow bottom land with an adobe and clay subsoil. This kind of clover grew nearly waist high last spring on a piece of land that I volunteered, having wheat on it last year.—T. J. S., Geyserville.

[Answered by Prof. P. B. Kennedy, University of California]

The plant which your correspondent sends in for identification is one of the native clovers, *Trifolium melananthum*. Too little credit has been given to the members of this genus as they occur in California. There are at least fifty different species in the State, growing under a great diversity of soils and climate.

Some are perennials, others annuals. They may be found by the sea, in the woods, in swamps, or on dry hillsides. Some prefer sand, while others are most at home in heavy adobe. Even the highest alpine meadows are not without them.

The sum total of their value as food for stock on the range and stubble pastures must be very great as they are all palatable and nutritious.

It has also occurred to me many times that they must have an important bearing on the fertility of the soil, and this perhaps explains how we are able to grow a crop of oats year after year on the same land. After the oats is cut for hay we will find the stubble teeming with half a dozen or more species of these little clovers.

It is one of these that your correspondent wants to know about. This particular one, *Trifolium melananthum*, grows mostly in damp soil. It is an annual with a straggling habit, and will continue to grow so long as there is any moisture, even if grazed off several times during the spring or summer.

Pound for pound we would consider it equally as good as burr clover or alfalfa either for pasturage or hay for all classes of stock. We have never seen it growing anything like "nearly waist high" as described by your correspondent, and as the stems are very fine and the leaves abundant, the yield under such circumstances must be enormous. It will grow again if irrigated.

No seed can be secured on the market, and so it would be necessary to save your own seed. As the seeds are very small, ten pounds per acre would be ample. After the grain is drilled in, using about one-half the usual rate of seeding, the clover should be broadcasted on the surface and very lightly harrowed or brushed in.

We, of course, take it for granted that your desire to grow this clover in preference to alfalfa is because your soil and climate are not suitable to alfalfa. It is just possible, too, that you wish a short rotation.

County Horticultural Commissioner Knowlton advises that Kern County has 1100 acres of cotton. They have had no trouble in obtaining plenty of good pickers. The gin is running a capacity of about 10 bales per day. Under the supervision of the Department of Agriculture, Kern county is endeavoring to produce pure cotton seed, and this season has a nucleus for the production of enough seed for supplying all of the valley district.

The growing of cotton in commercial quantities in the San Joaquin valley is attracting hundreds of people to that section, many of whom are planning to plant the coming season. Comparative figures compiled by the California Products Company indicate that at least 30,000 acres will be planted next season in the territory between Bakersfield and Corcoran, as against 4000 acres last year.

don't PLANT JUST "HAIRY PERUVIAN ALFALFA SEED"

Wideawake ranchers are buying Germain's reliable, proven seed.

We successfully introduced this wonderful type of seed in this section—and we stand solidly back of it. We guarantee it to be the true Hairy Peruvian strain. To insure perfect results buy only the proven Germain variety.

Crop Growing Without Irrigation

(By Hardy W. Campbell, Farm Advisor for Southern Pacific.)

I would urge double-disking before plowing; the cutting to be fully three inches. A tandem disk is preferable, but if you use a single disk, let it lap one-half each time around. Single disking is not desirable for two reasons: First—It does not sufficiently pulverize the top. Second—It leaves the surface uneven. It is preferred that this disking be done when the soil is slightly moist, but in no case when it is wet. The big advantage derived in preceding the plow with this disking is that you will be able to obtain a fine, as well as firm, condition in the bottom of the plowed field. It is very important in preparing for the crop, to make the lower half of the furrow absolutely fine and firm; even a slight defect there may cause a reduction of five or ten bushels per acre in the possible yield.

This lower stratum, or root bed should be fine so that it will take and hold water like a sponge, as it is nature's laboratory where her various elements, heat, air, and water, are combined, transformed and promoted into plant energy. To carry the necessary high percentage of water and low percentage of air, this soil should be fine and firm, under which condition the warm sun puts into active service millions of micro-organisms developing the desirable bacteria so necessary for that rank, healthy growth. I have seen hundreds of fields, in districts of light rainfall, where a portion was well disked before plowing and the balance plowed without disking, and have never failed to see a perceptible difference in favor of the disked part where all conditions were otherwise equal; in fact, I have seen results—two to one, in favor of having the under portion of the furrow fine and firm, the principal reason being its increased moisture retention.

Some Common Mistakes.

A somewhat common idea in farming without irrigation is to plow deep and then harrow the surface down again. Then, when it rains, harrow again. Now, following such work with the average heavy soils in California, if you cut down a square cross-section of the furrows to the bottom and remove the dirt from one side, you would find that your soil at the top would be ideal for your seed bed at the bottom, because of its fine condition; while the bottom soil would be better for the top, because of its coarse condition.

The specific condition above outlined is especially true in case the land is to be summer-tilled and planted to crop the following fall, because of the following detailed reasons.

Stored Moisture Should Develop Plant Food.

The too common idea of summer-fallow is to simply let the land rest. Please forget this, and turn your attention to the question of getting the soil into such condition that it will work all summer, improving in its physical condition, and increasing the available plant food, both of which will add bushels to your anticipated crop.

Soil Formation Important Item.

A loam soil with a little sand is the easiest soil from which to get this fine under-portion of the furrow, while the adobe is the hardest or most particular. Consequently, it is vital that

you study your soil and observe under what moisture condition it works best, to obtain the desired consistency.

Plowing.

Plowing should be done as much before the principal rains as possible, and for winter or spring seeding should be five to six inches deep, while plowing for summer-tilting may be six to seven inches. It is very desirable to have your furrows even in width and depth, mainly to guard against any possible loose places in the lower part of the furrow after it is turned over. With the top three inches loosened and somewhat fine, but by no means dust, then with good even plowing, we are working toward that vital, fine, firm seed and root bed.

Follow the Plow with the Disk.

Follow the plow closely with the disk harrow, with the disk set practically straight or one notch back and well weighted. Do not fail to weight it, equivalent to about 25 pounds to each disk blade, thus forcing the edge of the blades well into the furrow, filling the open spaces and settling the looser places.

It is desirable to follow the plow closely with the disk, or at the same time when plowing is done, if your power is sufficient.

Now, if you will carefully think over the whole process, you will note that our effort is to obtain a fine under-portion of the furrow with a coarse, loose or open top, and why we are so earnest on these points. Do not follow with the harrow. Leave this coarse, loose top for the next rain. If it is a good and somewhat prolonged rain, you will observe that it will go down quickly into the subsoil. On its way down, it will dissolve and more fully settle our seed and root bed.

The Spike-Tooth Harrow on Summer-Tilled Lands.

It is not desirable to use the spike-tooth harrow after the early winter rains, unless the rain is a very heavy one, but as spring, with its warmer weather approaches, cultivation should follow the rains before the top gets dry. For this cultivation the spike-tooth harrow should not be used too freely, as it has a tendency to make the top too fine. Should you be compelled to use the disk, do not cut too deep; a three-inch mulch should be the limit of depth during the spring months.

WHEAT FOR RICH LAND.

To the Editor: I have some rich irrigated ground on which I wish to sow wheat, but am afraid of rust and too much straw. Where can I get the Salt Lake Club referred to in your issue of Dec. 13 and how much should I sow?—R. B. W., Porterville.

"Salt Lake Club" is practically unknown in California. Little Club has done well in conditions similar to yours. Defiance wheat is considered rust-resistant if you can get the pure seed, which we doubt. Sonora is the chief variety grown in the rich irrigated Tulare lake bed. Sow about 100 pounds per acre and the wheat itself will show you whether more or less should be sown for following crops on your land.

IS CHICORY A PEST?

To the Editor: Is chicory a pest and hard to eradicate?—W. L. E., Philo. It is not troublesome where good cultivation is practiced. It is a perennial and has a fleshy root, but this does not survive after cutting off the crown deeply.

Fall River is to supply water for an irrigation district of 16,000 acres in Shasta county.

Alfalfa Seed

Seven Different Kinds

There's one BEST kind of alfalfa seed for your particular soil and moisture conditions—and we'll help you select it.

Our new booklet tells you what kind of alfalfa seed to plant to get the best results on any kind of land.

Each of our various kinds of alfalfa seed has been grown for a long time under the same conditions, so that a uniform type and an excellent quality has been developed. SEND A POSTAL FOR THE BOOKLET, which tells you how to have success with alfalfa.

BOLTON ORCHARD HEATER

The U. S. Department of Agriculture estimates the annual loss by frost at \$75,000,000. It may hit you next. The Bolton Orchard Heater Prevents Frost Damage

Safest and surest frost prevention method known. Coal and wood heaters take too long to generate required heat. The Bolton beats Jack Frost to it, generates heat rapidly, maintains the temperature above the freezing point. This is important.

Send for Booklet B-1
Tells you all about frost prevention. Filled with valuable information for the grower.

AGRICULTURAL NOTES.

Seven carloads of barley were shipped recently from Turlock to England.

The California Bean Growers' Association has begun upon a campaign for more members.

California stands second in rice production for the United States, being beaten only by Louisiana.

In Los Angeles district continued cold weather and rains last week held back cauliflower crop and the expected increase of supplies for shipment did not occur. Quality is fair.

In San Diego County the estimated acreage of peas is 600 acres, about a third of which will produce a very small inferior crop on account of lack of proper fertilization and care.

Libby, McNeil & Libby have bought 1289 acres of rich farming land in the northwestern section of San Joaquin County at \$300 an acre for agricultural uses, it is announced.

A Stanislaus farmer offered his beans at four stores in Modesto. He sold at four cents and stood around awhile. Some of those beans were sold to his neighbor at nine cents.

Cotton seed is now bringing \$63.50 per ton in the Palo Verde Valley. During the early part of the season the price of seed stood for some time at \$47. Later the price went up to \$50.

The past season 210 acres of rice were planted near Meridian, Santa Clara county, from which an average of 61 sacks to the acre were harvested. The experiment is regarded as a success.

Sheep owners in Yuba County have requested the Government to make an investigation into a poisonous composition in rice stubble which is killing sheep by the score in Yuba and Butte Counties.

American buyers are reported to be negotiating with the German Potash Syndicate for a supply of German potash. Indications are that Germany soon will deliver a large quantity of the fertilizer to the United States.

In the Los Angeles district recent cold weather has retarded development of the cabbage, reducing the available mature stock. The shortage has been augmented by growers holding for higher prices, refusing to cut. Buyers paid growers as high as \$70 per ton.

The tomato growers of Merced have organized the Merced Growers' Packing Association. The growers have made contracts to deliver to the association not only their early tomatoes, but also other kinds of vegetables grown by them, for packing and marketing.

The Merced and Stanislaus Sweet Potato Growers' Association, a non-profit, co-operative organization, has been incorporated. The concern is organized for the purpose of producing, preserving, drying and marketing sweet potatoes and other agricultural products. The principal place of business will be established at Turlock.

Luther Burbank has entered a contract with G. Imai, one of the leading silk producers of Japan, to perfect a mulberry tree superior to that in most general use at present. Burbank said a larger leaf of better quality was desired, and a tree of more rapid and compact growth, because for silk producing purposes it is cut back each year. He expects to have the new variety ready for use in four years.

We have learned more about the marketing of our honey in this last year than in all the years that have passed. When a thousand minds begin concentrating on ways and means to improve the marketing of their honey, there will be as marked changes along this end of their business as there was between the old box hive and the modern hive of today.—Honey Producers' Co-operative Exchange.

The yield of rice in the Oakdale district was from thirty-five to forty sacks per acre. Some of the local growers, as a result of their success the past season, are planning to double their acreage next year. Three years ago rice growers in this district

were forced to feed their rice to the hogs because they could not get an offer of more than \$1.70 per hundred, which was less than the cost of barley or other hog feed.

Secretary of State Frank C. Jordan, after a tour of the Northwest on behalf of a movement to memorialize Congress for importation of Chinese agricultural laborers, said he came back satisfied that sentiment in Washington and Oregon favors bringing in from the Orient the help absolutely necessary to secure the production so essential at this time.

Six officials of the United States Department of Agriculture, who are visiting the cotton fields of Fresno county, examined with especial care the crop of Pima cotton which is being grown at the Kearney vineyard. Dr. K. Kellerman and C. O. Cook of the party pronounced the cotton grown there to be of the very highest type in the United States. They said: "Recognizing the fact that the present high price of cotton will mean the planting of a large acreage in the San Joaquin valley this spring, the experts strongly emphasized the necessity of planting only one variety of cotton in any one district, if pure strains are to be maintained. Since cotton readily cross-pollinizes the planting of different varieties in close proximity would spell disaster to the industry."

A CHEAPER FLOUR OFFERED.

The United States Grain Corporation has arranged to have a cheaper flour thrown upon the domestic market. This flour is the export grade and in California is made of straight California wheat. The loaf made of this flour is not so white as the bread made of high patent, but as a food, it is considered just as palatable and nutritious.

The mills have consented to co-operate in the distribution on a basis which will allow a 49-lb. sack to sell at \$3.00, a 24½-lb. sack to sell at \$1.55 and a 10-lb. sack to sell at 65 cents.

All stores and retailers may obtain a supply by applying to the mills and agreeing to sell at the prescribed prices.

Onions

—a crop that is sure to pay

Right now is the time to get onion seed because the time of planting is at hand.

And remember: C.C. Morse & Co. are onion seed specialists. You can rely on Morse's seeds to grow and produce; true strain, soil-tested! Here are three varieties we particularly recommend:

Australian Brown, a very early, hardy variety; does well in California. Should be planted early on low, wet ground. Skin is thick; color rich brown. Keeps late into the spring without sprouting or shriveling. Price: \$2.00 lb.; in 5 lb. lots, \$1.50 per lb.

Ohio Yellow Globe is the best of the yellow varieties. Skin is bright, glossy orange-yellow; the flesh is white and fine-grained. Bulbs are remarkably uniform in size and shape; stand shipping well. Price: \$2.50 lb.; in 5 lb. lots, \$2.10 per lb.

Yellow Danvers is the best known of the yellow flat onions; extra hardy and a heavy yielder. Bright orange yellow; flesh white and firm. A standard market variety. Price: \$2.25 lb.; in 5 lb. lots, \$1.75 lb.

Order all your seeds from Morse at once and make ready for planting. Write today for quantity quotations on the seeds you need. Write today for the 1920 Garden guide, a practical manual of Pacific Coast planting. It will help you—and it's free. A post card mailed today brings it.

Mechanical Power on the Farm

FEDERAL AID FOR MOTOR TRUCK HIGHWAYS.

Delayed in its program of good roads construction by the war and confronted at the end of that period by a condition of badly run-down highways, the Federal Government, co-operating with the highway departments of the several States, has resumed the vigorous prosecution of the work, and, says David F. Houston, Secretary of Agriculture, there is now no special obstacle to the construction, in the different States of the Union, of those roads which serve the greatest economic needs. In his annual report, Secretary-Houston says:

"Good roads are essential to the prosperity and well-being of urban and rural communities alike. They are prerequisite for the orderly and systematic marketing of farm products, for the establishment of satisfactory rural schools, and for the development of a richer and more attractive rural life. Recognizing these facts, the Federal Government, through the passage of the Federal aid road act in 1916, inaugurated a policy of direct financial participation in road building operation in the various States. This act appropriated \$75,000,000, to be matched by an equal amount from the States, for the construction of rural post roads over a period of five years, and \$10,000,000—\$1,000,000 a year for 10 years—for roads within or partly within the national forests. It required each State to have a responsible central highway commission with the requisite powers and funds. All the States have complied with the terms of the act, although it was necessary for them to enact additional legislation, or to amend their constitutions; to provide sufficient funds to match the Federal apportionment; and to strengthen existing central highway bodies or to create new agencies.

"When these preliminary steps had been practically completed and the department and the States were about ready to proceed vigorously with the actual construction of roads, the United States entered the war. It soon became necessary greatly to curtail highway building because of the difficulty of securing transportation, construction materials, and the requisite services. After the armistice was signed, arrangements promptly were made for the active resumption and vigorous prosecution of road work in all sections of the country, not only with a view to repair the damage wrought by the heavy traffic forced upon our highways during the war, when maintenance operations were seriously interfered with, but also to provide adequate transportation facilities to serve the increased needs of agriculture and industry. Recognizing also that road-building activities would furnish suitable employment for many unemployed men during the period of transition from war to peace, the Congress at its last session, accepting the recommendation of the Department of Agriculture, appropriated \$209,000,000, in addition to the \$85,000,000 provided by the original act, for the extension of road construction in co-operation with the States, and also made some important amendments to the act. The definition of the kind of roads that can be constructed was greatly broadened and the limitation on the Federal contribution for any one road was increased from \$10,000 to \$20,000 a mile. These amendments have greatly facilitated consideration of and action upon the road projects submitted by the State highway commissions. There is now no special obstacle to the construction, in the different States of the Union, of the roads which serve the greatest economic needs."

NEARLY 2,000 UTILITIES.

The annual report of the State Railroad Commission recently issued, tells of the filing with the commission of annual reports of 819 public utilities. These reports cover the financial activities of 62 steam railroads, 34 electric

railroads, 2 express companies, 25 water carriers, 75 electric companies, 27 gas companies, 13 gas and electric companies, 109 telephone companies, 3 telegraph companies, 7 telephone and telegraph companies, 306 water companies, 142 warehousemen and 14 wharfingers. Of the 819 utilities 96 were new public utilities. In addition there are about 1,000 auto transportation utilities under the commission's jurisdiction.

TRACTORS FOR VINEYARD SUBSOILING.

One reason some vineyardists do not buy tractors is that they have not left space to turn at the ends of the rows and so it is necessary to use a team. Sometimes it works the other way, particularly since we are learning how to do things, such as subsoiling vineyards and orchards. A tractor can pull a subsoiler and make turns with it as easily as it can operate with a plow, but it would take such a long string of horses to pull a subsoiler that they would usually have to telescope into one another when it came to turning in most vineyards. And yet, if a vineyard is better for subsoiling, what can be done about it if a tractor is not used? Modern methods demand right soil methods.

On the Pinkham-McKevitt ranch near Exeter, a 12-20 orchard tractor has been used very successfully for subsoiling on a mature vineyard planted on former hogwallow land, which is always underlaid by hardpan. As the outfit went along one could feel the subsoiler tremble as it went through the hardpan, some chunks of which were torn loose as big as a man could lift. Naturally, such hardpan in its natural condition could not be broken with such a small tractor, but it had been weakened by irrigation and the action of roots, also some dynamiting had been done. The benefits to the soil of breaking up such hardpan and the plowsole above it will be very evident.

The tractor self-evidently was not strong enough to do heavy work like this all at once, as the subsoiling was done at a depth of 24 to 26 inches, so the method used was to set it down about half-way and break up the ground that far down and later come along in the same track with the standard set full depth. In this way only 12 to 14 inches raw earth had to be broken at once. A much larger tractor could have done the work in one trip, but it would not be so convenient in turning. This machine could have made it in one trip, too, by going in low, but it was better to make two trips with it.

This tractor has also been used for leveling and has given great satisfaction. By putting a tractor to this use on a ranch, many more days' work a year can be gotten out of it. It moved far more dirt than two four-horse teams and used only approximately 12 gallons of distillate and one gallon of oil a day. Two men were used in scraping, though with some outfits one man can operate both tractor and scraper.

Although on many large fruit ranches where tractors do the heavy work horses are used for furrowing out for irrigation, this tractor is used for that purpose here. The depth of furrows might be the same in each instance, but the tractor moved along so rapidly and steadily that it gave entire satisfaction.

CALIFORNIA ELECTRIC DEVELOPMENT.

"California public utilities, both from an operating and financial point of view, present an outlook that, we believe, reflects favorably the work of the Commission," is the statement of the State Railroad Commission in reference to the figures compiled by its experts for the annual report. Pointing out that the utilities are going forward with development and construc-

tion work to meet the growing needs of the State, the Commission says:

"Hydro-electric companies have started new plants which will entail an expenditure of more than \$25,000,000. The construction work is being actively carried on and some plants will be in operation in 1920 and others in 1921. While an expenditure of \$25,000,000 may seem large, we are satisfied that it will not result in an over-production of hydro-electric energy. It will permit the suspension of the more costly generating of electric energy by steam plants, results in the saving of 2,000,000 to 2,500,000 barrels

of fuel oil and a material reduction in operating costs, all tending towards a development that ultimately will bring to the rate payer a maximum of service at a minimum of cost, the real aim of utility regulation."

A successful tractor user says it is a big mistake to wait until bearings get loose. He tests the end bearings occasionally by having a man jiggle a bar under the fly wheel at the rear and the fan pulley in front, while the operator keeps his fingers where the crankshaft emerges from the crank case.

REMOVING ORCHARD TREES EASY.

After Wells McGrady and Wm. Jones of Santa Clara county had grubbed out half a dozen cypress trees, it made them tired to look at a big one still remaining. So they bored a hole slanting to the center beneath the big tree's crown and shot a small piece of dynamite there. That made a hole which permitted them to drop a bundle of ten sticks where they would lift the tree. They were shot with fuse and they sure lifted the tree, making a hole big enough for a team of horses. 'Twas a lot easier and quicker and cheaper than grubbing.

Mr. Jones' prune trees had perhaps not received proper care all their lives. Anyhow they were set over a hardpan. Here and there throughout the orchard a tree died or was going to die two years ago when Mr. Jones undertook to improve the orchard. About 125 that needed replacement were dynamited out in the fall and new trees were planted in the same holes during the winter. It was found in replanting that the dirt had not yet settled enough and there were great air spaces underneath. Water and tamping filled these, and the new trees were not hampered by the hard layer, which had been well broken through. They are doing well now though they have had no irrigation in these dry years.

The auger is about five feet long and an inch and a half in diameter. This is sufficient to place a stick of 25 per cent dynamite under each tree and low enough down to break the hard layer. Some trees needed two sticks; but less would be used if it were placed as close as possible under the crowns so it would exert full force on the tree.

HOW BIG A PULLEY TO USE.

To the Editor: How do you figure the size of belt wheels for various machines. Say the engine runs 1200 revolutions per minute and the machine should run 3000 r.p.m. If the engine pulley is 10 inches in diameter, how big should the machine pulley be? Please give us a formula to use on any machine.—M. P., El Centro.

Let D equal the diameter of the drive pulley (on the engine) and d equal the diameter of the driven pulley (on the machine). Let S equal speed of the engine pulley and s equal speed of the machine pulley in revolutions per minute. Then D multiplied by S equals d multiplied by s. Substituting your figures for our letters, 10 multiplied by 1200 equals d multiplied by 3000. Divide both sides of the equation by 3,000 and we find that d equals 4. Therefore the diameter of your driven pulley should be four inches.

SUBSOILED FOR POTATOES.

Potatoes were yielding about 30 sacks per acre for Geo. Trapp of Los Angeles County, while neighbors around him were getting more than three times as much. To make them produce better, Mr. Trapp last fall hitched a 20-35 tractor to a three-standard subsoiler and broke up the hardpan on about 30 acres, loosening the dirt about 24 inches deep by cuts 20 inches apart, according to C. J. Webb, who drove the machine. It took three days to subsoil the 30 acres, using 20 to 25 gallons of distillate per ten hours. After this the soil took twice as much water; and doubtless the admission of air and water under the plowpan will permit bacterial action to make more plant food available for the roots which will be permitted to get to it.

BELT HORSEPOWER OF TRACTOR.

To the Editor: What relative horsepower can be expected from a tractor rated 8-16 for running machinery at high speed from belt, compared with a 12 horsepower stationary gas engine.—W. L. E., Philo.

If the tractor manufacturer has given you a correct rating and if the engine is in normal good condition, it develops 16 horsepower on the belt, which is a third more than the sta-

tionary engine, if the latter is correctly rated. For high speed machinery you will have to use belt wheels of diameter proportionate to the speeds of the engine and machine.

RAIN DROPS ON THE WINDSHIELD.

'Twas a nerve-racking drive through the showers on a black night. Every machine we met blurred the whole road with its light in a way that we had never experienced before. Never had the whole road been so obliterated from sight by the electric lamps hanging over bridges and curves and crossings. After fifty or sixty miles of this, the rain drops on the windshield were rubbed so they ran down freely. Then the driving was easy and the lights had no more blinding effect than on any night. The globular shape of the rain drops clinging to the glass had scattered the rays of light from approaching machines so that they blinded our eyes. Don't let rain drops cling to the windshield at night.

Is Dairying on Increase in California?

(Written for Pacific Rural Press.)

We hear before us the figures on the dairy industry in California for the fiscal years ending September 30, 1918 and 1919. On the whole we can answer the above question in the affirmative without chance of denial. The number of pounds of butter produced last year was greater by two million pounds than in the year immediately previous and cheese increased almost exactly the same amount. The percentage of increase, however, was much greater in cheese than in butter as butter only increased 3.4 per cent while the cheese total was over 18 per cent greater in 1919 than in 1918.

Why cheese should have increased more or a larger percentage must be due to a better price to be obtained for the "trap bait" than for the biscuit lubricant. We find, however, when we come to compare the prices of butter and cheese month by month throughout the two years that it is not until the last part of 1919 that the price of cheese crept up on that of butter. During the months of July, August and September cheese was somewhat more than half the price of butter, but throughout the other 21 months it ran along just about half the price of butter. When butter rose a point cheese would respond with a half, and when one went down the other followed suit, and it seems that the "trap bait" took a majority of the tricks.

This condition of affairs is rather difficult to explain from our point of view. Many of us are fond of cheese, but the retail price has been so high that we could not afford to buy it as a regular article of diet, but considered it a luxury. Butter on the other hand we look upon as a necessity and must have on our tables at all times. The question seems hard to answer when viewed in this way. Cheese, the luxury, increasing 18 per cent in volume in one year and butter, the necessity, only 3.4 per cent.

The best we can do is to advance a theory. Butter had competition while cheese had not. Some will say that the competition in the butter was not very strong because oleomargarine is not used on many tables when the whole is considered. That perhaps is true, but the place of butter has been usurped by many other things than the oleos—peanut butter and other preparations of like nature; corn oil, cottonseed oil, peanut oil and combinations of vegetable oils and animal fats that are used for shortening and other ways in cooking that the housewife in times past thought nothing so good as butter. We think she was right, too, but the substitute will answer and is cheaper therefore in these times of H. C. L. butter is saved for the table. It is saved for the table not altogether by the housewife, but by the baker and confectioner who found the substitutes for butter cheaper and for 99 per cent of their trade answer just as well.

Therefore, when butter found its place partly taken, it calmly stepped from the cream separator to the cheese vat, and instead of being used as a lubricant for 17-cent bread, became the appetizing partially digested food that is known in various forms but for all that is cheese. As long as the price of the cheese remained where it did, and it even gained, the milk continued to be enamored by the cheese vat and forsook his former dizzy companion, the cream separator.

Some will ask, "But has not cheese had competition also?" Hardly. No one has as yet, to the writer's knowledge, at least, found a substitute for cheese. To be sure, we have a substitute for the genuine Swiss cheese manufactured from goats' milk in the imitation made from cows' milk. It is a very good imitation, too—so good, in fact, that many never have tasted the genuine article. The cheddar cheese that we all know so well has seldom been imitated although years ago in the great dairy regions tributary to Chicago, Miss Butter undertook to sneak out of the cheese vat by the connivance of her then new attraction, the cream separator, and leave in her stead a lard compound,

and the cheese resulting from this combination of skim-milk and "Neutral oil" was known as "filled cheese." The practice was soon forbidden by law although the product was not distasteful to many cheese lovers.

A few words more on this subject of competition before we leave it for the drier and not so malodorous fields of statistics. Who do you think has ever been able to find a substitute for Limburger cheese? It certainly would be a brave man who would make the attempt for he might find a combination that would equal the most dangerous gas used in the late war. Brick cheese also would not be easy to imitate. Neither would Brie, Camembert, Stilton, Edam, Roquefort, or any of the numerous and delicate flavored milk coagulations of which many people are fond and are willing to pay a high price for.

There are other phases of the subject that show the inroads of the butter substitutes. From 1910 to 1916 the production of butter steadily increased from 46 million pounds to 70 million pounds, then fell to a little over 60 million pounds in 1918, and now has increased again to about 62½ million pounds yearly.

Cheese on the other hand started in 1910 and 1911 with somewhat over 4½ million pounds and has gradually climbed until the past year it made a big jump of almost 2 million pounds in one year, because people would have a certain amount of it and could pay the price. They could use a substitute for butter in some cases and the butter could be made into cheese profitably, which therefore was done. Perhaps this is not the reason for the higher percentage of increase in cheese, but it certainly looks possible.

WHY CHESTER WHITES?

The kind of hog that is always ready for market and still, if grown to maturity, becomes enormous in size—is a good grazer, and therefore makes good use of the alfalfa you are raising by harvesting, grinding and feeding at one operation. This is a great point in the good grazing qualities of hogs. They do not bloat, and with a little grain make good gains on alfalfa pasture, especially the kind that Lea Bleakmore raises on the Oak Knoll Ranch at Lakeport in Lake County. The pigs are long, straight and compact, retaining this form throughout their growth, always being right in conformation for market if fed properly, and this breed will endure as much improper

It might not be uninteresting to consider the dairy production by counties for the past two years. Humboldt, that for years was the banner dairy county of the State and is still a wonderful region in this respect—the butter production for this county was safely over the 5-million-pound mark by 1918 and almost reached the 6-million mark this last year. In cheese we find an increase of almost 800,000 pounds. Here is one locality, while increasing in butter, helped make the big jump in cheese production in the State.

Stanislaus this year is the banner county in both butter and cheese. Some of the butter stepped over into the cheese vat, for the total yield of butter was somewhat less and the cheese increased over 600,000 pounds. Truly a great change from a vast grain field of years ago to a region of alfalfa, dairying and orchards.

Santa Clara county, that is always

CALIFORNIA DAIRYING GOES OVER THE TOP.

The statistics following have been furnished the Pacific Rural Press by the Dairy Bureau of the California Department of Agriculture:

Butter Produced During Years Ending September 30, 1918-1919.

	1918	1919
	pounds	pounds
Alameda	315,472	1,079,352

BUTTER AND CHEESE PRICES FOR 10 YEARS.

The following are the average prices of butter and cheese in San Francisco for the ten years ending Sept. 30, 1919.

	Butter cents	Cheese cents
1910	31.30	15.60
1911	28.00	14.50
1912	30.77	15.46
1913	32.12	16.06
1914	27.61	15.79
1915	28.70	14.10
1916	27.39	15.54
1917	37.07	19.78
1918	45.07	23.38
1919	55.66	28.75

STATE'S BUTTER PRODUCTION FOR 10 YEARS.

The following is the butter production for the last ten years as reported by producers:

	1910	1911	1912	1913	1914	1915	1916	1917	1918	1919
	45,989,140	50,330,736	54,910,886	55,542,709	59,286,400	67,549,400	70,030,174	68,373,021	60,358,595	62,449,004

STATE'S CHEESE PRODUCTION FOR 10 YEARS.

The following is the cheese production for the last ten years:

	1910	1911	1912	1913	1914	1915	1916	1917	1918	1919
	4,648,348	4,040,491	4,785,617	5,600,972	6,016,815	6,249,755	7,745,124	9,236,663	9,795,974	11,600,138

ANNUAL VALUE OF DAIRY PRODUCTS—1919.

Butter, 62,449,004 pounds	\$34,747,983
Cheese, 11,600,138 pounds	3,335,040
Condensed, evaporated and powdered milk, 74,901,238 lbs.	10,111,667
Casein, 2,963,766 pounds	400,108
Milk sugar, 1,907,174 pounds	685,583
Market milk, cream and ice cream	22,484,000
Calves produced on dairies	1,500,000
Skim milk and buttermilk	1,250,000
Total value dairy products 1918	\$64,428,056
	\$74,615,381

Chester-White Pigs, Oak Knoll Farms. Note smoothness and symmetry.

feeding as any breed on earth. Just the kind of a hog for the farmer who wants to utilize his alfalfa and waste grain or who wants to make a busi-

ness of raising hogs, and Lea Bleakmore has 'em. Ask him, and he will tell you how good they are, but it won't be better than they are.

looked upon as a prune county, last year produced more cheese than any other county in the State this year, fell to third place, due to a decrease in production on her part and an increase in the two first counties mentioned. Her butter production is negligible, however.

Imperial county is said to have plowed up her alfalfa fields and is off flirting with King Cotton and the cultured cantaloupe, but the butter production is only a little less than that of Humboldt. It is just possible that the alfalfa from the fields that were plowed up never was fed to dairy cows, but was shipped instead. The cheese production is comparatively small, but increased one-third the past year.

Tulare county lost out on her 5 million-pound butter mark of last year and also dropped back slightly in cheese although this is a very small factor in the county's dairy produc-

tion.

Kings County, that is noted for many fine hogs, also has cows enough to produce over 4½ million pounds of butter this year and is increasing.

Fresno does not mix quite so much butter with the raisins this year, but has made a little more cheese.

Altogether, from these figures it would certainly indicate a growing industry from the production standpoint and the value of the dairy products, including the butter, cheese, condensed milk, and other material, is over 20 million dollars greater than last year, certainly some "going" business to jump from 54 millions to 74 millions in one little short year and in many parts a drouthy year at that.

Fifty million pounds of beet sugar is being shipped into territory east of Pittsburg and Buffalo and north of Virginia, it has been announced by the sugar equalization board.

GREATEST OFFERING OF Duroc-Jerseys

In the West

PUBLIC SALE Wednesday, January 28, 1920

Sale to Be Held Under Cover, Rain or Shine

40

**Bred Sows
and Gilts**

You need some of
these foundation
sows sired by the breed's most
noted boars.
They will prove
valuable assets
to your herd.

Bred to Our Three Great Super Sires

ACE OF PATHFINDERS

One of the greatest Grand Champion sons of the famous sire, Pathfinder.

MAMMOTH SENSATION, JR.

The greatest living son of Mammoth Sensation, the largest 2-year-old boar that ever lived.

GREAT SENSATION 2ND

The same breeding as the World's Grand Champion, 1919.

Look Over This Wonderful Offering

10 Two-year-old and Senior Yearlings

by Model Chief 2nd, Model Triumph and Councilor. Bred to Ace of Pathfinders, Mammoth Sensation, Jr., California's Great Wonder, Orion Reformer.

10 Yearling Sows

by Pathfinder, Great Wonder I Am, Pathfinder's Wonder, A Top Pathfinder and Creator. Bred to Ace of Pathfinders, Mammoth Sensation, Jr., Great Sensation 2nd.

10 Fall Gilts

by Bark's Premier Gano, King's Col., Golden Col. and Creator. Bred to Ace of Pathfinders, Mammoth Sensation, Jr., Great Sensation 2nd.

10 Spring Gilts

by California's Great Wonder. Bred to Ace of Pathfinders, Mammoth Sensation, Jr., Great Sensation 2nd.

These sows are either winners or their sires and dams have been winners at the leading Fairs and Expositions, both East and West

What Has 1920 in Store for Stockmen?

(Written for Pacific Rural Press by Thos. F. McConnell.)

"It is very easy for the optimist or pessimist to say that the future is all rosy or that peculiar blue color that is supposed to represent a condition of coming disaster, but it is as hard for one to prove he is right as it is for the other. However, it cannot do anyone any good to dwell on the pessimistic side of the question if there is one. We are not going to admit there is such a side until compelled by actual circumstances to do so. We do not believe there is anything at present to cause anything but optimism for the future of the livestock business in this greatest of all livestock states-to-be.

We would hardly call him a wise man that would lament over any adverse circumstances of the past. What is the use of "crying over spilt milk" if there was any spilled, which we very much doubt. If there was not any spilled then why are we to think there will be in the future. It is true that some things are lower than they were a year ago, but there is not so very much difference in others. It is impossible for market hogs to always be worth twenty dollars a hundred-weight like they were in August, and cattle only ten dollars. If that was the case for any length of time every one would be raising hogs, and cattle would disappear.

Now we hear swine growers express themselves very freely about the price of hogs and the price of feed, saying that the hogs will have to go if there is not a change some way. It is not to be supposed that men will continue to raise hogs for fifteen dollars a hundred with barley seventy-five dollars a ton and other feeds in proportion, but the fellows who stay in the business are the ones who will reap the benefit of profitable prices for hogs or dairy products or beef cattle. The man that stays by his business reduces the losses to a minimum by good management during the periods where the price of feed is too high for the price obtained for the product. These periods are the ones that really discover the true stockman.

Horses Are Higher.

There really is an improvement in the horse situation. The horsemen who have stayed in the business report a brisk demand for breeding stock. The number of mares bred during 1918 was the lowest in the history of the business in California. While there are no available figures to prove this statement, it is a self-evident fact that needs no demonstration to those who are and have been in close touch with the situation.

According to the estimates given in the table based on figures published by the U. S. Dep't of Agriculture the number of horses in California in December, 1919, is 11,000 less than in the same month 1918, but the value is increased by over 1½ millions of dollars. The low value animals, "chicken" horses, etc., have disappeared and those that are left are good, and those interested are awakening to the fact that we need horses yet and that the local supply is not equal to the demand.

There is another reason for a stiffening in the demand for draft horses and that is the European situation. England and Scotland have already taken some draft horses, with Belgium asking for some of her own good drafters to replace those taken by the "unspeakable Hun." To just what extent this trade may be developed is an unsolved problem.

Mules Are Good Property.

Like the horses the mules are estimated to be less in number, but those that are left are worth more than those of a year ago. Two thousand less in number, but they are worth over one hundred thousand dollars more than they were a year ago. Good large mules will be needed for years to come, and this will be another factor that will help the horse business because we cannot have good big mules without good-sized mares for dams. It will be many a long year before a good span of 1200-

pound mules will not bring "good" money.

Dairy Cows "Coming Up."

The "foster mother" of the world is certainly coming "into her own" in California. She is in the spotlight to an extent that would make the most beautiful and popular "movie" actress green with envy. What with Civic Leaguers, Boards of Health, various District Attorneys, "the Centralizers," the State Dairy Council, and last but not least "the Associated Dairymen of California, Inc.," all advertising bossy cow and her product, is it any wonder that she should get vain notions as to her value and do the enhancing stunt until her aggregate value this year is over 12 millions of dollars greater than it was last, with the end not yet in sight?

In the dairy cows we find the numbers increased by about 16,000 the past year. Not only are the numbers increased but the estimated average value per head has advanced about twenty-three dollars, so that a man who owned 100 head of good dairy cows in December, 1918, had his investment increase in value \$2300 without any effort on his part other than that of the good care necessary for good production. It seems as though he must be a very lucky man, but with alfalfa hay worth \$25 a ton in the stack and milkers asking more money all the time the roses in his pathway have most of the thorns on them.

Butter started in at 67 cents during the first week of 1919, but in six weeks had fallen to 44½, or lower on the San Francisco market. From this low point it recovered to a point better than 50 cents and at present is around 65 cents, which is about equal to the price of a year ago.

Beef Cattle Are Holding Their Own.

Market beef cattle commenced the year of 1919 at a fair value in comparison with the other meat producers, the top steers being about equal to the best of the lambs in the San Francisco market but somewhat behind the top hogs. The steers held their own fairly well up to the first of April, when the annual flood began and the price commenced to drop. By the first of July the best steers were down to almost ten cents in the Coast markets, including Portland and Los Angeles. From this time the price remained stationary until about the first of November when it began to stiffen a little, although no spectacular rise has taken place.

The number of beef cattle in California at this time according to our estimates is slightly larger than a year ago, but owing to the depression of prices the total value is a little less. This includes all beef cattle from a market viewpoint.

The purebred business at this time is on as firm a footing in California and the country at large as it ever was. Top cattle are bringing, on the whole, as high prices as ever before in the history of the business as is shown by the prices obtained at the auction sales and private treaty. This is as it should be, too, for the South American trade is calling for purebred cattle in large numbers. The Brazilian government estimates their country will need 12,000 bulls annually for the next ten years and has recommended government assistance to purchase that many. It is just a matter of going after and getting the business, and right here is where a strong organization like the California Cattlemen's Association ought to and is going to be of great value.

Sheep Are Good Property.

They have been such good property that one prominent sheep man said last May that it excelled all others not of a speculative nature. He claimed that he could take a definite sum of money and by investing it in sheep would get better returns than any one else could in any other line of business. We will admit he was somewhat like the stone-mason, carpenter and tanner that were appointed as a committee to decide on the best

material with which to construct fortifications about their city in ancient times and each one declared positively in favor of the material with which he was most intimate, even to the tanner who declared "there was nothing like leather." Granted the sheep man was prejudiced in favor of his woolly favorites, the fact remains that the sheep business has been a good one in the past few years, and while it like all other lines of business has its ups and downs the future outlook is excellent.

The same sheep man mentioned above stated he had sold wool for 4 and 6 cents per pound, with lambs bringing 6 "bits" a head; this last spring his wool brought 56 cents and lambs no better than the cheap ones for \$9 apiece.

The estimated number of sheep has increased slightly during the past year but the total value is less by a very small margin.

The market price of lambs has decreased very slowly during the past 12 months, being at the present time about 1½ cents lower than a year ago.

The wool situation is rather mixed, with some grades selling strong and others not moving at all. The grade that is bringing the top price is a fine delaine and combing, with fine clothing and coarse wools very slow. People are buying the finest cassimeres and worsteds and are willing to pay almost any price as long as they can get what they want.

Taken from all viewpoints the sheep men are in as good a situation as any of the livestock men and the outlook is encouraging, especially for the good grades of mutton and wool.

Swine Are Spectacular.

Hogs have attained the highest price in the markets of the world the past year ever known in the business. If feed had not been so high most of the swine raisers of California would have been millionaires this fall. For all of this handicap, however, where they raised their own feed and had alfalfa pasture to help out they were in a position to boost the auto business right along with Henry Ford eliminated.

The first of the year saw market hogs bringing a good price, which continued without variation until about the first of March when the demand stiffened and from then on until the first two weeks in August when the zenith was reached in the San Francisco market with top hogs bringing \$20.50 per hundred-weight. From this time on the price dropped until the first week in November, when 13 cents was paid in San Francisco. This was the low mark of the year. The price advanced to 16 cents, but broke sharply the third week in December due to the unloading of a large number of hogs at this time because feed continued to advance and feeders could not stand the pressure.

The purebred side of the business has felt the influence of the drop, it is thought by some, but first-class gilts and sows continue to bring good prices.

Taken altogether, the livestock situation is far from being a discouraging one. A country as large as this has become with the methods of communication so good, our manufactures increasing by leaps and bounds, the demand for food stuffs must hold up. Milk and its products, meats, woolen clothing and shoes all in great demand, the outlook cannot help but be good. People will grumble at the prices they have to pay, but until they stop buying autos and going to theatres and the "movies" they will continue to buy food and clothing.

A. J. Elliott of Tulare has sold to R. F. Guerin, of Visalia, a high grade Poland-China gilt, and two others to the Bakersfield Boys' Pig Club, one for \$300 and one for \$150. At the county Poland-China breeders' sale at Tulare, February 6, Mr. Elliott will consign nine young sows, all bred to the famous Poland-China boar, "The Californian."

UP NORTH

JERSEY COWS are adaptable to any climate. Hale in the North—hardy in the South.

Always efficient yielders of the richest quality milk—always dependable and gentle—always a pride to their owner.

JERSEYS

Jerseys consume less feed than any other breed. Every dollar you put into Jersey feed doubles its value in the milk pail. Her milk averages 5.37% butter fat. Butter and cheese made from Jersey Milk is the best obtainable. Let us mail you free some interesting data and information about the Jersey Breed.

Livestock Queries and Replies

(Written for Pacific Rural Press.)

Warts on Pigs.

To the Editor: Will you please advise me what to do for my pigs? They have what I believe to be warts; it shows mostly on the neck and ears, and some of them also have it very badly on their legs, covering their entire hams and tail. It seems to give them an itch for they are always scratching themselves. They are bothered with this scale or wart for at least two months. Their appetites are, and always have been good, but their growth has been stunted greatly, in fact, some of them are losing in weight, for their affected parts are full of wrinkles. Have dipped them twice, according to directions for scale with a coal tar dip, but without success, as the warts still seem to be thick and fast as ever.—J. P. N., Cuyucos.

(Answered by Dr. E. J. Creeley.)

Nothing will cause an animal to lose flesh like an irritation from parasitic infections of the skin. Mange was exceedingly prevalent in France among the remounts of the Allies. Everything ever known was tried without avail, until the following process was adopted:

Unslaked lime 8 lbs.
Sulphur Flowers 22½ lbs.
Water 30 gals.

Boil 2 hours until you get a chocolate colored mixture, then add 60 gals. water. A dipping vat is filled with the mixture, and every 5th day the animals were dipped. The temperature of the mixture must be between 105 to 110 deg. Fahrenheit while the animals are being dipped.

Every animal was completely cured in a few dippings and it did not return. Your pens and fences are full of the parasites, and you must exercise just as much care in disinfecting the surroundings as in disinfecting the animal's body, otherwise after curing the pigs they become reinfected.

Toggenburg Has Cough.

To the Editor: I have a Toggenburg doe that I purchased recently. She has a dry cough, and has had it ever since I have had her. She grinds her teeth between coughs. I thought a cough uncommon to goats. Can you tell me of anything to do for her? I was told to give her oil-of-tar, which did, but it did not seem to help her much. Do you think she can be affected? And would her milk be good to use? Hoping to see an answer in your paper soon, and oblige.—Mrs. F. A. L., Hollister.

(Answered by Dr. E. J. Creeley.)

Chronic Laryngitis.

Gritting the teeth would indicate a foreign body. I would advise the following treatment: Inhalation of Vapo-cresoline in a small closed room for 4 hours daily. Give 1 ounce of white mineral oil once daily. Apply a good liniment outside the throat once daily, and give the following electuary twice daily:

Pulv. Belladonna leaves ½ ounce
Pulv. Liquorice root 4 ounces
Pulv. chlorate potash 1 ounce
Pulv. camphor ½ ounce
Black molasses 8 ounces

Mix thoroughly, and spread on tongue with a flat stick, one tablespoonful twice daily. Moisten all food. Please report progress after 10 days' treatment.

Horse Has Open Joint.

To the Editor: I have a mare which I believe has an open joint, caused by a kick in the elbow. It discharges continuously a thin, serous fluid, amber colored. The inflammation and swelling have subsided considerably, and the opening is small. Have clipped the hair and shaved the edges of the opening, and have tried to form

a gelatinous plug with Monsell's Solution. Am now using Gum Arabic, Boracic Acid, and Alum, equal parts, as a dusting powder. I am keeping her as quiet as possible, but of course am not able to keep her from using the joint altogether. Would a sublimate bogie, or actual cautery help, and what are the chances of recovery?—L. V. N., Spyrock.

(Answered by Dr. E. J. Creeley.)

Apply a strong blister around the opening, and apply directly into the wound, Lugol's solution of Iodine once daily. Apply vaseline below the wound, so the hair will not be removed by the discharge. The blister should be as follows:

Simple cerate 1½ ounces
Biniodide Mercury 4 drachms
Lanoline 1½ ounce

Mix and apply with plenty of friction. Clip the hair over area to be blistered. Prognosis very grave if lameness is severe.

Horse Has Stomach Worms.

To the Editor: I have a horse that has large stomach worms. Send me your best remedy for the same.—G. W. B., Sacramento.

(Answered by Dr. E. J. Creeley.)

Turpentine 2 ounces
Pearson's Creoline 1 ounce
Extract Male Fern 1 drachm
Kamala 4 drachms
Raw Linseed Oil 20 ounces

Mix and give after 24 hours absolute starvation. Do not expect results without the 24 hours' absolute starvation.

Warty Eruptions on Udder.

To the Editor: I have a cow that has warty flat eruptions on her udder, just above the teats. They are dry, and while giving no pain, may be an injury. They are flat, dry, and rough, like a scab. Can they be cured?—S. B. B., Guerneville, Calif.

(Answered by Dr. E. J. Creeley.)

Apply Fowler's Solution Arsenic to growths once daily for 1 month. Report results at the end of that time.

BEWARE THE FOOT-AND-MOUTH DISEASE.

A recent outbreak of foot-and-mouth disease in England, now believed to be confined to the immediate neighborhood, is cited by officials of the Bureau of Animal Industry, United States Department of Agriculture, as an illustration of the virulence of the malady and how the most aggressive steps toward its control are necessary. The experience in England is a reminder of similar outbreaks in the United States. This country is now free from the disease, but all persons are urged to be eternally on guard and ready to report any suspicious cases to Government officials.

Four days after the disease was reported on a farm adjoining a repatriation camp at Littlethorpe, England, to which the farmer was daily selling milk, the malady has spread to two adjoining farms, and in a few more days had appeared in 17 places in the neighborhood. The infection was carried by visitors, by butchers who slaughtered the diseased and exposed cattle, and in one instance by a veterinarian whose clients owned infected cattle. The disease is thought to have been brought to the neighborhood by soldiers returning to the repatriation camp from France and Germany.

As soon as the disease was confirmed on January 9 by the Board of Agriculture of Great Britain, an area of 30 miles surrounding the infected district was quarantined, and no animals or straw, fodder, hay, manure or similar products were allowed to move in or out of the quarantined territory.

Large Production and Fine Type

are combined in the get of
**PRINCE RIVERSIDE
WALKER**

Aggie Acme of Riverside 2nd and Miss Valley Mead De Kol Walker, his two sisters, made the highest official yearly butter record and the highest butter record for three-year-olds, respectively, for 1917-18. His get won first prize at Sacramento last year. We are breeding his daughters to

King Korndyke Pontiac 20th

our young \$6,500 sire, whose great individuality, fine type, and backing of an unbroken line of great producing dams are hard to beat. Come and see the result of this breeding, or write us for further particulars.

Our Entire Herd is Tuberculin Tested.

Dairy.

Charles Anderson of Burbank has recently brought two carloads of registered Holstein-Friesians to add to his already excellent herd. Mr. Anderson now has one of the most promising herds in Southern California.

The Holstein-Friesian cow Winifred Ora Bell, owned by E. F. Curtis & Son of Exeter, has just completed an excellent 7-day test at W. J. Higdon's Tulare Holstein Farm. She produced 26.54 lbs. butter from 526 lbs. milk from only three-quarters of her udder.

Milk from a thousand cows a day is being used in the manufacture of milk powder at Tulare, nine pounds of the powder with 91 pounds of water making 100 pounds of milk. The whole milk is being purchased from dairymen at 25 cents above the butter fat quotation.

The A. W. Morris & Sons Corp. of Woodland have received notice of the confirmation by the court of the sale of the Herbert E. Coil Ranch to the corporation for a more convenient location for their great Holstein-Friesian herd. This ranch is only about one mile from Woodland.

State records for butter production, at any age and of any breed, have been broken by Ruby Pierterje of Forest Hill 2nd, belonging to W. J. Higdon, of the Tulare Holstein Farm. The senior four-year-old, in a 30 days' official test just completed, made a showing of 162.1 pounds of butter from 3144.6 pounds of milk. The record is the second highest in the world at the age. Mona Forbes, another Higdon cow, has just shown 30.3 pounds of butter from 515 pounds of milk in a seven day test, the third 30-pound record in the herd this season.

Sometimes people in a certain line of business will become depressed for some reason difficult to understand, but it would hardly seem as though it could be the dairymen at the present time if we are to judge by the present demand for dairy cows. As an example of what is going on in this line Geo. P. Robinson, dairy cattle broker of Sacramento, received telephonic orders for 90 head of registered dairy cattle within half an hour one evening lately. One party wanted 40 head and the other 50 head. The

chief difficulty was to find that number immediately, but George thought he would be able to secure them.

The annual meeting of the Central California Milk Producers' Association in Modesto lately resulted in the re-election of Chas. H. Geer as president and all the members of the board of directors, with four additional as provided by an amendment to the by-laws.

J. P. Phillips, proprietor of Allana Farm and breeder of top notch Holstein-Friesians, has sold his ranch near Fresno and bought 80 acres of alfalfa in Solano County near Dixon and on the San Francisco State Highway. Mr. Phillips will erect an up-to-date dairy and breeding farm set of buildings.

The Toyon Farm Association has recently sold to the Sonoma State Home at Eldridge Toyon, Bertram Valdessa, a young son of their herd sire, Flanderne Soldene Valdessa, and Bertha Boskadel, a very promising young cow with a two-year-old record of 21.62 pounds of butter from 467.81 pounds of milk in 7 days. She also has a 272 day record of 456.68 lbs. of butter from 10,352 lbs. of milk. The purchase of the bull by this institution is a source of satisfaction to the management of Toyon Farms, as it is a direct appreciation of their effort to furnish animals with breeding showing high production and also an absolutely clean bill of health.

A. A. Jenkins of Tulare, breeder of purebred Jersey cattle, reports the following sales, which he made in December. To Sherman Herzhberger & Son, of Tulare, Gertie's S. V. Eminent, a young bull of exceptional breeding, carrying as he does the blood of Gertie's Lad and Eminent Raleigh. His dam has just finished a Register of Merit test of 625 lbs of butter, with her second calf. To A. J. Waite, of Earlimart, Gertie's S. V. Exile King, another son of Gertie's Son's Victor, who is proving to be one of the best bulls in the State. His full sister is on R. of M. test and has made 464 lbs. of butter from January 22, 1919, to December 1, 1919. Age 2 years, 1 month, at beginning of test. To H. D. Beckwith, of Tulare, Gertie's Olga Patis Lad. He is sired by Gertie Melia Pogis, a Register of Merit Bull. His dam is of Meridale Farm breeding. All registered Jersey bulls.

The U. S. decennial census enumeration will take place during the first part of the year that is just upon us. Among the questions that will be asked of farmers are some especially concerning dairymen, a list of which are furnished here:

1. How many gallons of milk did you sell in 1919?
2. How many gallons of cream did you sell in 1919?
3. How many pounds of butter fat did you sell in 1919?
4. How many pounds of butter did you make in 1919?
5. How many pounds of butter did you sell in 1919?
6. How many pounds of cheese did you make in 1919?

In addition to this Uncle Sam will ask how much each dairyman received from the sale of each one of the products; so be prepared when the official enumerator comes around and have the data available.

Beef Cattle.

Among the great Shorthorn sales of the year is that of W. A. Forsyth & Sons of Pleasant Hill, Mo. The 62 head sold brought \$75,206 or an average of \$1213. Truly there is money in Shorthorns.

Milking Shorthorn breeders from twenty states and Canada assembled at an informal dinner at Chicago during the International. They plan to hold two consignment sales during the year and carry on much promotion work.

Rodent control is of great importance in the range cattle business, according to H. G. Keiley of Merced Falls. The owners of the Cunningham Ranch in Merced county claim they are running 500 head of cattle (Continued on page 907.)

YOU CAN SEE THEM GROW CHESTER WHITE WEANLINGS

The kind that start right, keep right and end right. Long, wide, deep, compact and symmetrical. Easy feeders, good grazers, ready for the market at any age. The kind that grow into money the quickest of any breed and dress out the highest percentage of marketable meat.

Largest herd in the West headed by Highlander, the great \$1,000 boar. Bred gilts, sows, boars, weanling pigs.

The Giant Bob Sale

My entire herd of Big Type Poland-Chinas, including **GIANT BOB**, the grand champion boar of 1919, will be sold at Public Sale

Monday, January 26th, 1920, Fresno, Cal.

Practically the entire offering bred to or sired by Giant Bob. There will be a few bred to Prospector and Gatewood's Prospect. These are two of the best young boars I could find in the corn belt. Every Poland-China I own will sell in this sale. Plan now to attend.

CHAS. GATEWOOD,

Fresno, Cal.

Farm Bureau Hog Auction Sales

(Written for Pacific Rural Press by R. N. Davis, Fresno.)

The advance in prices in general and the increased cost of living which became very apparent during 1917-18 made it essential that the livestock farmers receive more for their product. The high prices of grain brought this fact so plainly before the hog growers of the San Joaquin Valley that they realized they were not receiving as much for their hogs as it cost to grow them. It was apparent that something must be done to relieve this condition or the hog growers would be compelled to divert their efforts to other lines of farming.

Origin of the Auction Sale.

This was at a time when our Allies were looking to us for large amounts of pork and pork products, saying nothing of our own enormous requirements. It was at this time that the American Government was making every effort to increase the production of animal products which was so essential for the winning of the war. At this critical moment, the Kern County Farm Bureau conceived the possibility of using the auction sale which has been used so successfully in Australia. Before these sales could be conducted successfully, the co-operation of the packing houses of the State must be secured. At this time only one of the big packing houses had a representative in the valley. Co-operation of the packers was sought and arrangements made for a sale.

Although the first sales were conducted with only a limited number of buyers present, they were considered very successful and the auction sale spirit soon spread to the adjoining counties of Kings and Tulare. As soon as other counties began to hold auction sales it was realized that there must be some kind of co-operation between the different counties in order to prevent conflict in sale dates so the different buyers could attend all sales. This, of course, could best be accomplished by an organization, the manager of which to be directly in charge of all the sales in the different counties.

Farm Bureau Marketing Association Takes Shape.

The natural result was the organization of the California Farm Bureau Marketing Association which was perfected and the association became operative on November 1, 1918. At the time of its organization, the Association consisted of the Farm Bureaus of Tulare, Kings and Kern counties. The Board of Directors was composed of one director from each of the three County Farm Bureaus. Mr. D. H. Bitner, a progressive farmer of Kern county and a strong believer in co-operation among the farmers, was selected as manager. The results of the sales continued very sat-

isfactory and resulted in the addition of other counties to the Association. The present membership of the Association includes seven San Joaquin Valley counties, viz.: Kern, Tulare, Kings, Fresno, Madera, Merced and Stanislaus.

Although there were only three counties in the Association for three months after its organization and some of the counties have only been members for a short time, the Association during the first year of its existence conducted 155 sales, at which was sold 526 carloads of hogs, or a total of 42,000 head, which compose a gross weight of 8,500,000 lbs. of pork, which brought \$1,500,000.00. There were 4,300 different consignments during the year. The manager considers \$100,000.00 a very conservative estimate of the amount received by these consignors above what they would have received had they marketed their hogs otherwise than through the Association.

Scope of the Auction Extended.

In addition to hogs, there were over \$19,000.00 worth of cattle and \$3,000.00 worth of miscellaneous products marketed through the Association, the result of which was very satisfactory.

The reader will note by the number of consignments given above that a large number of small consignments were made. A large percent of the total number of hogs was made up of entries consisting of from one to twenty head. However, a number of large growers sell through the Association and are convinced that they receive better prices for their hogs than they would have if they had shipped direct to the packing houses, this because of competition between the different buyers.

Packers Co-operate.

The packers state that the hogs cost them more when purchased through the auction sales, but they are getting a better quality of hogs and they prefer to pay a better price and get a better product.

A great deal of credit is due the packers of the State for the success of these sales. Without the co-operation of these packers, the sales would be impossible. It is very gratifying to know that all the principal packers of the State have representatives at these sales.

Although only a limited number of cattle have been marketed through the Association, the results are such as to demonstrate that the Farm Bureau auction sales would be as valuable to the cattle growers as it has been to the hog growers, both in price and improvement in quality of product. Therefore, why not cattlemen and other stockmen get together and profit by this wonderful demonstration of co-operative marketing?

Duroc-Jersey Sale Supreme

Those who admire and breed Duroc-Jerseys, and those who intend to start breeding swine but have not as yet decided what breed to raise, should attend the auction sale to be staged by the Diamond Bar Ranch at Spadra on January 28, 1920. Southern California has a number of great Duroc-Jersey swine-breeding establishments and with one or two others the Diamond Bar stands out as the highest exponents of the breed in that part of the country.

The offering to be made by this great ranch will be excelled by none anywhere regardless of location. This is rather of a broad statement, but when we take into consideration what they have to select the offering from and the facilities they have for caring for their stock then it will be understood.

To begin with selections will be made from a herd of 800 head, the foundation of which was selected from the most noted herds in the Middle West by Superintendent Walter T. Gattón, than whom there is no better judge of his favorite breed. An excel-

lent demonstration of this was the shipment of sows and gilts brought out this past summer. The animals were chosen at widely separated farms and when finally brought together were found to be of the same excellent type of the breed. It is easy enough to select animals of the same type from a herd, but when chosen from widely separated herds and when brought together, if found to be of one type it is an excellent demonstration of the buyer's good judgment. No better type or one nearer what the majority of breeders are looking for can be found anywhere.

Forty bred sows and gilts will be offered due to farrow in March next. They will be bred largely to Ace of Pathfinders, the Grand Champion at Los Angeles, and winner at the National Swine Show at Des Moines, Iowa. Others will be bred to Mammoth Sensation Jr., Great Sensation 2d, California Great Wonder and Orion Reformer.

To those interested we would like to impress on their minds the facts that all the animals offered will be

bred right and will be of the very best type as well. Fitted but not overfitted. Just in the right condition to show well and then farrow the nicest and biggest litters you ever saw. You all know that a sow or female of any kind must be well fed to produce the maximum in progeny, both in number and proper development of body.

The combination of the blood lines of the Pathfinders, Great Wonders, Ganos and Colonels will produce to a certainty the great size so much desired at present with superb quality, which means quick growth and easy-

feeding qualities.

It will be an opportunity of a lifetime for those who wish to buy Durocs, where they can buy just what they want and need.

Col. Ord L. Leachman, the popular auctioneer of Sacramento, will cry the sale.

The Carnation Milk Co., one of the largest milk condensing institutions in the world, with condenseries in Washington and Wisconsin, has started to build a \$250,000 plant at Gustine in Merced County.

Xmas and New Year's Greetings:

From FRANK P. GARDINER and SON to our friends and customers. We also wish to announce the safe arrival from Ed Kerns of Stanton, Neb., of the latest and Greatest Sensation to come to the Pacific Coast.

GREATER SENSATION

PROMOTE PORK PROFITS

With Better Poland-China Breeding

And do it by attending my bred sow and gilt sale at

RIPON, FEBRUARY 3rd.

There are 85 head of the very best Poland-China sows and gilts to be found anywhere in my herd at present. This is true, both from conformation and breeding standpoint. From this 85 head I shall select 60 head for the sale. If you want Poland-Chinas, and you need them in your business, of the modern type, they certainly will be in this sale. STOCK FOR SALE AT ALL TIMES.

WAUKEEN FARM

LES McCracken, Prop.

Ripon, Calif.

THE MORRIS HOLSTEIN SALE.

A combination of excellent cattle and a great reputation for having a herd of large producers, especially "long distance" ones, makes a good sale certain. It is "a house built upon a rock," it is so sure. The evidence of this is the fact that 62 Holstein Friesian cattle brought \$29,270, or an average of \$472 at the A. W. Morris & Sons' Corp., sale at Sacramento, December 18th.

The cattle were widely distributed throughout California and several new herds were started. It does not look as though dairying was on the decline.

The top of the sale was reached when H. E. Vogel, the well-known Holstein-Friesian breeder of Fresno, paid \$1,050 for Princess Valley Mead Walker, sired by Prince Gelsche Walker and out of De Kol Valley Mead 3rd, with a 2-year-old record of 16 pounds of butter in 7 days. Another that was close to the top was Riverside Seely Girl 2d, sired by Segis Pontiac DeKol Burke and out of the high-producing dam Riverside Seely Girl for which Chas. A. Harrington of Compton paid \$1035. Several others sold close up to the \$1,000 mark. The top bull was King Clarinda Sadie Vale sired by King Korndyke Sadie Vale 27th and out of King Segis Pontiac Clarinda for which the Hayes Stock Farm of Sacramento paid \$650.

The heaviest buyers were Hayes Stock Farm of Sacramento, getting eight for \$4010; J. McKinley of Acampo getting seven for \$3080; Gleason & Walker of Hollister getting three for \$1475; E. M. Holje of Calistoga four for \$1430, and P. Brunold of Modesto four for \$2570.

E. C. Schroeder of Moorhead, Minn., H. M. Corwin and son of Rock Valley, Iowa, and B. L. Cramton, manager of the Pabst Stock Farm, Oconomowoc, Wis., were Eastern breeders in attendance.

The condition of the animals was just about right and Jack Shillcox, who had charge of them previous to the sale, should come in for his share of the credit.

THE BIG SALE AT THE TAGUS RANCH.

A two-day sale with receipts of \$50,000 was satisfactory enough so that the Merritt-Bowers Co., owners of the Tagus Ranch at Tulare, set the date for their spring sale. The attendance was large on both days with the bidding lively. Col. Leachman of Sacramento, who cried the sale, says it was a good one and that the farm horses sold better than they have for some time. One draft team brought \$675 and some mules about as much.

Cattlemen prominent in the business from all over the State were present. Fred H. Bixby of Long

Beach, recently elected president of the California Cattlemen's Association, was there and made a strong talk for the cattle business from both the purebred and market standpoints, and also a boost for the Association in which he is a great believer.

Thos. Harrison and Dr. J. J. Summerfield of Santa Rosa were there and bought freely. Mr. Harrison, of course, selecting some of the Milking Shorthorns that met the approval of his keen judgment.

J. A. Knight of Tipton was the heaviest buyer as he had bought thirteen when the sale was over, although T. R. Carlyle of Sanger was close to him with eleven to his credit. Turney Bros. of Strathmore and Col. T. E. Cochran of Hanford bought freely also.

The top of the sale was Heard's Queen, sired by Coronado and out of Craggs D 3rd, for which T. R. Carlyle of Sanger paid \$500. This cow had a bull calf at foot sired by Knight Avon 2nd.

The stock was in good condition and just right for a sale, but the demand for bulls not being brisk it was considered best to hold them for the spring sale after six of the Herefords and five of the Shorthorns had been sold.

ORLAND, THE POLAND-CHINA MECCA.

The Glenn County Poland-China Breeders have announced their first annual guaranty sale to be held at the Glenn County Fair Grounds at Orland on Tuesday, January 13th, when they will offer 65 head of big-type Polands from the leading herds of Glenn county. This county is becoming famous for its good stock of various breeds and its Polands are right up with the best in the country. For this sale the following breeders have made consignments: R. J. Yates, R. M. Rankin, Penfield Bros., Y. H. Warnock, J. A. Miller, J. K. Burnett, M. H. Summers, Adam Lachenmeyer, Ferguson & McKaig, Charles Templeton, W. A. Ort, Mrs. C. J. Lothrop and J. E. Faltings. Among the service boars are Yates' Big Orphan by Hather's Big Orphan out of Miss Hadley, A. Buster by Long Jumbo out of Miss Stella, and Young Hadley by King Hadley Jr. and out of Sampson's Kind. Ord L. Leachman, the livestock auctioneer of Sacramento, will handle the sale.

W. J. HIGDON'S COW GOING IN HIGH.

The Holstein cow—Ruby Pieterje of Forest Hill 2d, whose 39.74 pound 7-day record was recently reported in these columns, has increased her production gait and now, at the end of 30 days, has 162.11 lbs. butter and 3,134.9 lbs. of milk to her credit. This is exceptionally good and breaks all California records. It also exceeds all other records in the world for a like period except one in the Cabana herd. If the records of this last-named herd are expunged from the Holstein books, this will leave Mr. Higdon's cow champion of the world for this period.

H. L. Redd, manager of Mr. Higdon's herd, has personal charge of this cow, and nothing will be left undone to keep her at championship production speed. Thirteen cows have made 7-day records in excess of 30 pounds at the Tulare Holstein Farm, and eleven of these cows were owned by Mr. Higdon.

BUY TYPE AND PRODUCTION.

CALCO feeders save costly grain

Grain at any price is too valuable to waste.

The Calco Self-Feeder was developed—to save your costly grain.

The Calco Self-Feeder is so constructed that it is impossible for the hogs to root the grain onto the ground—and grain saved is money saved.

Calco Self-Feeders add materially to your profits by saving expensive time and labor.

These Feeders are made of rust-resisting "Armco" Iron and Cast Iron. They are sanitary—easily cleaned—strong—durable and economical.

Your name and address written on the margin of this advertisement and mailed to us will bring folder and prices.

Poultry and Rabbits for Profit

BADLY INFESTED CHICKEN HOUSE.

To the Editor: I have just moved in on a ranch here, and find a chicken house that I would like to use, but am told by the last tenants that it was uninhabitable for chickens as it was full of lice, that they had tried everything, but without avail to move them. I hate to have to burn it up at the present price of lumber and write to ask what suggestion you can give me to make it safe to use for thoroughbred chickens.—E. Drennan, Fresno.

If the poultry house mentioned is worth more than \$10 it is possible to economically destroy the lice and render it safe for poultry in so far as lice and mites are concerned. We believe our correspondent refers to the mite, the small insect which is often called the night-louse, that sucks the blood of the fowls at night and goes into hiding during the day. However, the treatment of the premises that we recommend below will not only exterminate them, but in a great measure destroy any other sort of insects that can annoy fowls. First clear out the worst of the dirt and rubbish and then spray lightly with water; get it into every crack and opening. When the water has nearly evaporated sweep and brush the dust from every part of the house, nests, and roosts. The object is to gather up the dust and prevent it from floating about and thus preserving some of the mites or eggs. When dry, spray the entire house and fixtures with a mixture of stove distillate in which is mixed some strong insecticide. One part of insecticide to ten parts of distillate is usually strong enough. The distillate is the common sort that is extensively sold for burning in kitchen and heating stoves. It is also known as blue or medium distillate and is low in cost. Commercial cresol, crude carbolic acid, or one of the commercial liquid lice paints will answer for the insecticide. If the house has a wooden floor it should be first scrubbed perfectly clean in order that the mixture can soak into the wood and run down into the cracks. If convenient to do so it would be well to take up the floor to discover any special hiding place for the mites. Before relaying the floor disinfect the ground and foundation. Spray entire premises about three times.

WHAT CONSTITUTES A GOOD LAYER?

To the Editor: We have three hundred Leghorn pullets eight months old. They are laying on an average of 135 eggs a day. Is this considered good for this time of the year? A few of the pullets want to set after laying two months. Would they be considered good pullets to keep? Or is it customary for them to set at this time of the year? Please tell us the name of a good poultry book.—Mrs. J. M. R., San Jose.

It is difficult to accurately analyze the intrinsic value of a flock of pullets without a more or less extended statement regarding the feed and care they receive and the conditions under which they are kept. However, three hundred pullets now fully eight months of age should be laying more than an average of 135 eggs per day—45 per cent—if they are to make an average yearly record of more than 110 eggs each. The fact that some of these pullets wanted to set after laying for two months leads us to believe that they are capable of laying many more than the present average of 135 eggs would indicate provided they are fed with a ration properly balanced for egg production. It is hardly possible that these Leghorn pullets would develop a desire to set unless they were over fat or feverish, due to eating a ration containing too much starch or other fat-forming elements; quite likely also they were not provided with much if any green feed. We would not condemn these pullets until they are first afforded an opportunity to show what they can do when supplied with a correctly balanced ra-

tion and abundance of greens. A book entitled "California Poultry Practice" is considered a very good poultry book. We sell it; price, \$100 postpaid.

EGG STANDARDIZATION.

Recently a conference on the International standardization of eggs was held in London. Chief interest centered around the methods of grading followed by Denmark and Canada. Denmark has adopted the system of grading by weight with only casual attention to the actual interior quality of the eggs.

The Danes have been following this system for a number of years, and have acquired a considerable reputation on the British market.

The Canadian standards are based primarily upon quality and relative edibility, with subsidiary weight clauses leading to uniformity in size. These standards have been in force two seasons only, but the reports received as to the quality of the eggs upon arrival are increasingly favorable as the Canadian methods of grading and inspection become better known.

The representatives in conference from Denmark, Holland, France, Italy, China, United States, Canada, Ireland, Scotland and England, together with representatives from the London produce trade, approved of the advisability of international standards for eggs and the matter of the form of standards was referred back to the respective governments they represented.

It is probable that Holland will follow the lead of Canada and South Africa. The United States also is favorably considering the Canadian standards.

HOGAN SYSTEM FOR OLD HENS.

(Written for Pacific Rural Press by D. J. Whitney.)

There are two ways of finding what hens are past the best laying age in Tulare flocks. Some ranchers who have Leghorns keep three breeds: White Leghorns, Anconas, and Brown or Buff Leghorns, raising chicks of a different color each year and using color as a measure of age when it is time to cull out the old hens in summer and fall. This system of keeping three breeds of similar nature is seldom practiced by keepers of the heavy fowls, who mostly favor Rhode Island Reds.

The only way to proceed when there is no measure of color is to judge the individual bird, which can be done when the whole flock is of one color. In a number of cases the spread of the pelvic bones as described in the Hogan system, is successfully used in combination with natural indications of youth or age as shown in general appearance. This method of culling has been layers is very satisfactory as it permits exceptionally good hens to remain in the flock another season which could not be done very well if color were the standard of culling, and it permits the rapid discovery of young slackers who should go to market.

In flocks of one color every hen has to be examined to see if she will qualify for culling. By the three-color system only the hens are handled that are to be marketed.

BLUE JAYS KILL CHICKS.

(Written for Pacific Rural Press.)

Something was killing the baby chickens on the ranch of F. P. Storm near Tulare. They would be found in the yard during the day with a hole in the back of their heads, and it seemed impossible to think who the criminal could be or to discover him at his tricks. Just by accident a blue-jay was seen swooping down to the ground and right up again and a dead chick was found where he had been.

Jays are criminals among birds. In this case they were either killing the chickens for the joy of the thing, or just to eat the brains, and they were

clever enough to stay out of mischief when a person was in sight.

After the discovery was made, war was declared on the jays and when they were driven off the chicken-killing stopped. People who suffer in like manner will know whom to blame.

GERMOZONE The Best Pet Stock Remedy

For Poultry, Pigeons, Dogs, Cats, Rabbits, Parrots, Canaries and other birds or pet animals, Germozone is a universal and safe remedy for colds, sniffles, run, sore throat, loss of voice or singing, influenza, bowel trouble, distemper, sore eyes or ears, canker, gleet, loss of fur or feathers, sores, wounds, skin diseases, or other affections of skin or mucous membrane.

"My hens have never done so well this year and haven't lost a single chick."—Mrs. Flora Kapple, Walker, Ia. "Simply grand for rabbits."—L. W. Browning, Boone, Ia. "Cannot praise Germozone enough. I use it for chickens, stock and household."—Mrs. Wm. Heupel, Hugo, Okla. "My bird puppies don't know what distemper is and I never had such good success before with chicks."—Curley Smith, Kennett, Mo.

Germozone is sold by most drug, seed and poultry supply dealers, or mailed postpaid in 25c, 75c, and \$1.50 packages from Omaha. Book on treatment of diseases free with each package.

Geo. H. Lee Co., Dept. 428, OMAHA, NEB.

Ottawa Mfg. Co. 2710 Wood St. Ottawa, Kansas.

CARE IN EGG TRANSPORTATION.

An egg broken accidentally before it leaves the farm usually goes on the farm table, and nothing is lost. Eggs broken at the grocery may be disposed of at reduced prices as cracked eggs and little actual food loss results. But the egg broken after it is packed for shipment is likely to be a thoroughly bad egg before it arrives at its destination and become a total loss. With eggs selling at record prices, it is a matter of importance that a smaller proportion of eggs than ever before are broken in transit. This result was brought about by the co-operative efforts of the United States Department of Agriculture and the United States Railroad Administration. Employees of the Railroad Administration were

detailed to the Bureau of Chemistry, Department of Agriculture, where they received instruction in proper methods of loading and stowing eggs in freight cars. Wherever cars were received at terminals in a badly damaged condition, these employees of the Railroad Administration paid personal visits to the shippers for the purpose of instructing them how properly to load cars to avoid damage in future shipments. The result, according to the report of the chief of the Bureau of Chemistry, is a material diminution in the breakage of eggs during transportation.

SHIPPING AND SKINNING RABBITS.

To the Editor: Would like to learn through the question page of your paper how to dress rabbits for market, and packing and shipping and best place to market them. Also about skinning and preparing furs for market.—J. H. W. Sebastopol.

Can any of our practical rabbit raisers who read these columns answer the questions of this subscriber? The information would doubtless interest a large number of our readers.

RABBIT SHOW JANUARY 29-FEBRUARY 1, 1920.

The San Francisco National Championship Rabbit and Cavy Show will be held at the Civic Auditorium, San Francisco, January 29, 30, 31, and February 1, 1920, by the C. R. B. A., A. C. G. B., V. C. Howe, R. F. D. 207, N. San Leandro, is the Show Secretary and Superintendent.

LIVESTOCK NOTES.

(Concluded from page 902.)

more on 17,000 acres since they killed off the squirrels and gophers. Mr. Kelsey says that he has been poisoning squirrels for some time, and that it only took two sacks of poisoned grain to cover 3,000 acres of his own ranch, where it took 23 sacks to cover the same amount of land adjoining that had never been "baited."

Swine and Swinemens.

Good hogs, selling in Denver, Colorado for 11 cents, were shipped to Los Angeles, where they brought \$14.50. Some shift.

The Farm Bureau Hog Marketing Association is now getting out 2,000 sales date catalogues. They will be distributed shortly and will show sales dates for the entire San Joaquin Valley.

What was considered to be the first case of swine plague ever in existence in Sutter county was reported recently by Dr. A. S. Williams, County Veterinarian. The outbreak, if such it can be termed, will be controlled by vaccination.

Greenwood Farms, Live Oak, H. C. Witherow manager, reports business as good and that they have just shipped a bred gilt to Edward R. Aspen of Wasco and a boar pig to Geo. M. Sparks & Co., Ingomar, Merced County.

The fourth consignment sale under the auspices of the California Short-horn Breeders' Association will be held at the University Farm, Davis, Thursday, February 26th. Sixty head will be sold, including quite a large percentage of the highest class bulls.

The last Farm Bureau Hog Auction Sale at Modesto showed somewhat lower prices. The top was \$13.75 for a carlot of 220-pound hogs. The next was a lot of 56 that went for \$13.25 and from that down to \$12.50. With grain high and hog market edging toward the toboggan slide is a condition helped along by farmers rushing in half-finished hogs.

Through the assistance of the Kern County Union High School Board of Trustees the Boys' Agricultural Club of Kern County have been able to buy "Kern County Pilot," a full brother to "The Pilot," grand champion Poland-China boar at the National Swine Show at Des Moines, Iowa, this year. The Board of Trustees loaned the Ag. Club the money.

Les McCracken at Ripon has a sale slated for January 20th at which he will offer as good a lot of Poland-Chinas as fanciers will be able to find

anywhere. There will be 50 head of bred sows and gilts in the offering, many of them bred to King's Big Bone Leader, one of the best Poland-China boars west of the Rocky Mountains.

The end less pig club seems to be growing in favor in the East. One of the conditions under which a boy or girl receives a pig is that he or she shall return two pigs from the original gilt. These pigs are then distributed to new members under the same con-

ditions and thus the organization grows.

Breeders of Poland-Chinas and others who wish to start a herd of this popular breed should not forget the Glenn County Poland-China Breeders' Association sales set for January 13th. Many of the prominent breeders of the locality have consigned some of their best animals and the outlook for a record-breaking sale is of the best.

THE LINN TRACTOR

The strongest, most practical and most powerful hauling machine made.

Will pull the heaviest loads over plowed fields and irrigated ground. Hauls for half the cost of any other hauling proposition in the market.

THE LINN TRACTOR is the result of 15 years' study and experiment with self-laying track machines. It has patented features found in no other tractor. Equipped with Continental Red Seal Motor, Bosch Magneto, Schebler Carburetor, Brown Lipe Transmission and differential in two units. Equally adapted to hauling on the road or to plowing and other ordinary work of a farm tractor.

THE HOME CIRCLE

MOTHER O' MINE.

If I were hanged on the highest hill,
Mother o' mine, O mother o' mine!
I know whose love would follow me
still.

Mother o' mine, O mother o' mine!

If I were drowned in the deepest sea,
Mother o' mine, O mother o' mine!
I know whose tears would come down
to me.

Mother o' mine, O mother o' mine!

If I were damned of body and soul,
Mother o' mine, O mother o' mine!
I know whose prayers would make me
whole.

Mother o' mine, O mother o' mine!

—Rudyard Kipling.

SEEING EYES.

Rose Brooks.

Jack and Ted and Dorothy Burnam were spending the summer with their Aunt Madge in the New Hampshire hills, while their mother and father took a trip together to the Pacific Coast. As the farmhouse where they were boarding was seven miles from a post-office, no blue-uniformed postman came to their house two or three times a day with a fat brown leather mail-bag slung over one shoulder; but instead, a mail-box, perched on top a post, stood by the roadside, and every afternoon about three o'clock an old black horse hitched to a "top buggy" toiled up the sandy hill, and Fred Clarke, the genial country postman, deposited letters and papers in the creaky-lidded box, hoisted the little red tin flag, and drove whistling on to the next mail-box. His coming was incontestably the event of the day. Dinner was at one; every one was through and the dishes done by half-past two; and then the interminable half-hour to wait for the mail! No one could settle to anything until the old black-topped buggy had come and gone.

"Come down to the road, Aunt Madge, and wait for the mail," begged the children one hottest August day.

"All right," agreed Aunt Madge, pleasantly. "Suppose, after this, instead of waiting on the porch, we do wait under the big maple-tree by the gate,—and," she added with a sudden thought, "let's call this our 'game half-hour.' Run in, Jack, and get the steamer rug on the foot of the couch, and bring it out for us to sit on."

"Now what is the game, Aunt Madge?" asked Dorothy, eagerly, when all were seated comfortably under the cool, big tree.

"Well," began Aunt Madge, slowly, "let me see. I think," after a minute of thought, "I think,—yes, I know what I'll call our game! It shall be the Seeing Eye game, and we can play chapters and chapters of it," she went on with sudden eagerness, "at least one new chapter of it every day, and as much more as we like!"

"What a funny name!" said Ted. "Sounds queer. Don't all eyes see, 'cept, of course, blind people's?"

"No, my dear," was Aunt Madge's calm reply. "Very few people have seeing eyes. Most people have take-things-for-granted eyes, but it's only once in the greatest while that any one has seeing eyes, unless his eyes have been trained by somebody. I wish we could all have seeing eyes by the time we go home this fall. I'm sure mother would notice the change immediately. We've been here a week, haven't we? And each day, during our half-hour wait for Postie, we have played an Oh, Dear, game. Haven't I heard, 'Oh, dear, why doesn't he come!' and on days when poor Postie has been a little late such a chorus of Oh, dears! So let's give up the Oh, Dear, game and begin the Seeing Eye game. I'll stay here and time you, and in five minutes each one of you see how many different kinds of tree leaves or tree needles you can collect. Don't run, because the sun is hot." Off scurried the three children, eyes bright, feet nimble.

"Five minutes!" called Aunt Madge.

"Don't pick another one. You must stop the second I call time."

"Now, Jack, spread yours in a row at this end of the rug; and Ted, this end is yours; and Dorothy, bring yours here by me," said Aunt Madge, when the children were once more gathered around her. "When your exhibits are neatly arranged, you may each tell me how many you have, and how many of the leaves you know."

"I have six, Aunt Madge," said Dorothy.

"Seven," came from Jack.

And Ted proudly added, "Nine."

"Well, it seems as if Ted had the most seeing eyes this time for gathering, doesn't it? But we'll see who has the most seeing eyes for recognizing the leaves. How many of yours can you name, Dorothy?"

"This is an oak," began Dorothy; "and this one a pine needle, and this one a fir twig, and is this a birch? I don't know the other two."

"All right, except the one you called a fir twig. I wonder if the boys know what it is? And perhaps they will know the two leaves that you don't know."

"One of the leaves is an elm," said Ted, "but I don't know the other, and I thought that was a fir twig, too."

"So did I," admitted Jack.

"Now look, and learn, all you seeing eyes," laughed Aunt Madge, gayly. "Fir needles lie flat from the twig, but spruce needles grow all the way around, and you see these do grow all the way around, so they are not fir, but spruce. And the leaf that none of you know is an ash. Ash-trees are lovely in the fall, with their bunches of scarlet berries. Dorothy knew the birch leaf, but I wonder if any of you noticed how its stem is flattened a little bit one way where it joins the leaf, and flattened the other way where it is hung to the stem? That's why birch leaves are always ready to dance so prettily with the last breath of air that scarcely stirs the leaves on the other trees."

"Why, I didn't know that," said Ted. "I never noticed that leaves are fastened on in different ways."

"Yes," answered Aunt Madge, "and it's wonderful. And the more you use your seeing eyes, the more surprised you'll be all the time, and the more wonderful you'll find everything, every least thing you see around you. There is something—a great many things—to find out about everything. A perfect fairyland of adventure lies spread around us every minute, and it welcomes any one with seeing eyes, but no one with take-things-for-granted eyes ever gets in! When two persons want to talk over the telephone, you all know how Central has to make the connection. The wires are all up, and the whole mechanism is in working order, but those two people can't talk unless Central makes the connection. It's the same with us. Here are all the beautiful, wonderful things in the world,—and here are we, waiting to be connected; but we don't have to have any Central, we can make our own connections. One way to make connections is to train our seeing eyes. Why, if we have seeing eyes, we'll always be interested. We can't help it. Think how little we do know, and how much we can know. Just this morning you have all learned a very few very little things, and it has been fun, hasn't it? Just think of all the fun we can have always! Think of all the trees and flowers and grasses and birds and little crawly bugs and lovely flying butterflies and dragon-flies, and—and everything! I know the most interesting things about dragon-flies!" Aunt Madge's cheeks were pink and her eyes shining.

"Tell us about them!" chorused the children.

"Not today," Aunt Madge shook her brown head. "But I'll send for some books that will help us all to have more seeing eyes."

In a minute she went on, with sudden seriousness: "Grumbly, unhappy people never have seeing eyes. They

never make connections with a joyous fairyland. They shut their eyes tight,—their seeing eyes,—and all the sweet, wonderful things right under their noses are lost on them. But people with seeing eyes are always nice, happy people. They never grumble that time goes at a snail's pace—no, their days aren't half long enough."

"Let's see how many different leaves we can find before tomorrow's postman-wait," said Jack, eagerly.

"All right!" agreed the other two, enthusiastically.

"When you are gathering leaves," suggested Aunt Madge, "notice with your new seeing eyes the different kinds of bark that the different trees have, and see how much you can remember to tell me tomorrow. You'll be surprised. Your seeing eyes will be giving you nice little surprise parties all the time. Listen! I hear a creak, creak, and there's the horse!"

"How de do!" Mr. Clarke's greeting was always so close an imitation of a rooster's crow that it was the children's joy to hear him. "Lots of mail today. That's why I'm so late!"

"Are you late?" said Aunt Madge, in surprise. "We didn't know it."

"Half an hour late! Thought you'd all be pretty impatient."

"We've been playing a new game," said Jack, and they all looked so happy and smiling that Mr. Clarke volunteered: "Must have been a pretty good game!"

On the way up the little dusty, winding path, Aunt Madge reminded: "Don't forget that you've all only begun; and don't forget, too, that your seeing eyes are useful for everything, people as well as things. If you'll just use your seeing eyes, you'll discover the nicest things about people, and often where you don't expect nice things at all. We'll play the game hard all summer, and I hope much longer. There is no end to it, and each chapter we play, even if it's only a tiny one, makes the next chapter more interesting. Isn't it fun to have found a game that any one can play, and that can't end, no matter how many people play? Isn't this a nice cool porch?" she added. "And if here isn't a fat letter from mother for each of you!"—Exchange.

THE DIFFERENCES.

How to apply real economy to their household problems is the puzzler with which all housewives are faced during the present period of high prices. The desire to secure the best in quality for the most reasonable price is being considered in every family.

To aid the housewife in solving this problem, the Globe Grain & Milling Company of Los Angeles has published an elaborate little volume called "The Difference," and is distributing this book free to all who request copies. The chapter on "Buying Flour for Economy" relates an interesting incident of "the foolish housewife," and what happened in her household as the result of practicing false economy.

Another of the seven chapters, "The Difference," tells in an entertaining way how actual baking tests of bread, cakes and pastry are daily conducted at the Globe Mills to ensure the maintenance of a uniformly high standard of quality in the flour manufactured.

The book is well printed on good paper, is nicely bound in a white kid finish Bay Path cover, and is being widely distributed. It is worthy of a place on the library shelves of any home, and the inside information on the manufacture of good flour will be prized by all intelligent housewives and flour users.

THE CONSOLIDATED SCHOOL.

The little one-room schoolhouses should be viewed with alarm. There should be a consolidated school in each rural community, well equipped with an agricultural and domestic science laboratory. Every school should pay the agricultural, domestic science and other teachers good salaries. There should be a teachers' cottage and several acres of ground in connection with each consolidated school.

Enjoy this convenient lavatory

It's beautiful, durable and easy to clean.

It's made of Pacific Porcelain Enameled Iron and will give a lifetime of service.

Although Pacific Plumbing Fixtures are equalled in quality by only one other brand, you pay no more for Pacific Plumbing Fixtures than you would for inferior brands. All Pacific Plumbing Fixtures are guaranteed forever against any defects in workmanship or materials.

Schilling Tea, fine as it is, costs less per cup than any other tea we know of, and surely less than any tea selling at a lower price.

It costs a lot of money—the biggest part of the price you pay for tea—to get tea to you from the tea-plant.

So why pay that good money and get only common tea?

Schilling Tea costs more per pound but less per cup.

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchment-lined moisture-proof packages. At grocers everywhere.

A Schilling & Co San Francisco

CONTROL OF INFLUENZA.

The State Board of Health has issued a pamphlet discussing influenza and giving general advice in case of a recurrence of the disease.

The situation in influenza resolves itself into the carrying out of those measures that we know are applicable to all contagious diseases, plus such other measures as are made necessary by reason of the wide-spread character of the epidemic.

The health officer is justified in putting into practice any measures that would be regarded by the majority of his community as reasonable and that he himself thought advisable. This should include the prompt reporting and immediate isolation of cases, the closing of schools unless there is adequate public health nursing, the closing of all public gatherings and the enforcing of laws against expectoration in public places and the sterilization of common drinking receptacles.

Health officers should give publicity to the fact that, after all, the burden of responsibility in the control of influenza rests upon the people themselves.

Surgeon General Blue says: "There should be no repetition of the extensive suffering and distress which accompanied last year's pandemic. Communities should make plans for dealing with any recurrence of the epidemic. The most promising way to deal with a possible recurrence of the influenza epidemic, is, to sum it up in a single word, 'preparedness.' And now is the time to prepare."

FALL HOUSE-CLEANING HINTS.

Notwithstanding the aversion of paterfamilias to house cleaning, the lady of the house recognizes it as a periodical necessity.

However, the house cleaning is too frequently limited to scrubbing the wood work, beating the carpets and brushing the furniture. Need of renewals are generally overlooked—sometimes because of the expense involved, sometimes because the housewife does not realize how easily she could do the work herself and sometimes because she just doesn't think of it.

In every house, are to be found many things made of metal which become tarnished and shabby. Such things as andirons, water faucets, etc., can be gone over with a little metal lacquer and made to look like new.

Picture frames, chandeliers and other articles which were originally gilded or gold enameled, can be easily and quickly renewed with a little gold enamel. It is better to get that sold in combination cans ready for mixing with a little brush with which to apply it. Gold enamel will also vastly improve the appearance of tarnished radiators.

Even the shabbiness of the leather chairs may be removed with leather renewer with which the worn spots may be touched up. Leather renewers made of pyroxylin are preferable as they do not crack or rub off.

All of these re-vampers and renewers are to be found in drug, paint and general stores. They are obtainable in small packages, cost very little and are easily applied. One cannot realize how greatly their use improves and brightens the appearance of the home at house-cleaning time.

THE CARE OF TEETH.

Neglect of the teeth is one of the chief causes of decreased vitality and lowered body resistance. In fact, good health is impossible without sound teeth.

Toothache is painful and disagreeable, but is not the worst punishment following neglect of the teeth. Decay produces pus and poisonous matter, which cause rheumatism, heart trouble and other disorders, which cause disease in almost every part of the body.

The principal diseases of the teeth are decay, tartar and pyorrhea. They are all caused by neglect. Particles of food allowed to remain between the teeth, ferment and produce an acid, which attacks the outside enamel and produces decay. Tartar is a deposit which forms around the neck of the teeth at the edge of the gums. It is

Where Upkeep Counts Most

Twelve million miles of wire, connecting cities, villages, farms; running under busy streets and across trackless prairies; these are the Bell Telephone's avenues of speech.

These twelve million miles of wire, throughout every foot of their length, must be kept electrically capable.

A few drops of water within a cable may cut off a thousand subscribers. A line snapped by storm may isolate a district. A wet leaf touching a wire may stop service. In most kinds of work the lessening of efficiency

means merely the lessening of service; but with the telephone, mechanical and electrical conditions must be practically perfect to insure operation.

The most delicate electrical currents in use are those of the telephone, and inspection must be ceaseless that the lines may be kept in constant readiness.

These conditions and costs must be met to provide this high standard of service needed and demanded by the American people.

BLAZING-AWAY-IN-COST-DEFENCE!

DRY GAS OR WET VAPOR?

In all the claims of the past twenty years, regarding the perfecting of devices for the use of oil as fuel, an unconscious truth has always prompted the use of the expression—"Oil Burner"—and Oil Burners they have been, for wet vapor is nothing more or less than the burning of oil—even worse, for wet gas is the fastest of carbon makers—and there you have the whole trouble.

Almost anyone can make an "Oil Burner," but to make dry gas, clean, hot and economical, remained for the honest effort and painstaking thought, which resulted in "The World's Most Scientific Oil-Gas Burner"—the Dreadnaught. Better yet, it can be applied to any stove and installed by anyone—no changes to make. Real progress must now be made in the use of oil as a fuel—we have perfected the art for you, made it easy, cheap and full of comfort.

Start nineteen-twenty right. Orders filled promptly. Circular sent upon request.

a limelike substance which causes the gums to become sore and later to recede, thus exposing the more delicate portions of the teeth.

Pyorrhea is a loathsome and persistent disease of the sockets of the teeth and often leads to their loss. Successful treatment of these disorders can only be given by a dentist.

All members of a family should have their teeth looked over by a good dentist at least once a year, that small cavities and faults may be corrected in time.

The Egyptian cotton crop of 1919-20 is estimated at 1,243,000 bales of 478 pounds each.

BLINGERLAND SCHOOL OF MUSIC, Inc. Dept. 150 CHICAGO, ILL.

SAN FRANCISCO.

San Francisco, Dec. 24, 1919.
BARLEY.

Barley continues to show strength for both cash and futures, although cash prices for the feed description continue unchanged. May barley is quoted at \$3.71, indicating the dealers are not looking for lower prices. There is very little of the shipping grade on the market and what there is said to be not really first class. None of this is offered at less than \$3.75, and strictly first class shipping would doubtless bring a higher price. Feed \$3.65 @ \$3.75 Shipping \$3.75

OATS.

Red feed is unchanged this week, although some inferior stuff was offered at a lower price than last week's low. Notwithstanding this the market for oats is showing strength in consequence of the strength of the barley market. Red feed, per ctn. \$3.10 @ \$3.40 Red for seed. Nominal Black for seed. Nominal Recleaned Red or Black for seed. Nominal

CORN.

There was a demand for Egyptian corn this week for shipping, purposes and the really choice Egyptian found purchasers at 25 cents above the high of a week ago. California Yellow was unchanged by the demand for Egyptian. California \$3.40 @ \$3.50 Egyptian, choice \$3.40 @ \$3.75

HAY.

Receipts of hay for the past week were 638 tons compared with 1327 the previous week. The decrease was probably due to the heavy demand throughout the interior for hay to feed stock. The hay situation continues in bad shape, although a slight improvement over the previous week is noted. It is intimated by the Railway officials that this car situation will probably improve slowly from now on. With the dropping off in the receipts to such an extent the local market has been strong and active and higher prices have been demanded for such hay as has arrived. There has been considerable inquiry for hay from the south. It is also noted that considerable alfalfa has been purchased in Nevada and is being shipped to various points in this State. No. 1 Wheat, or Wheat & Oat. \$22.00 @ \$26.00 No. 2 Wheat, or Wheat & Oat. \$21.00 @ \$23.00 Choice Tame Oat Hay. \$24.00 @ \$27.00 Wild Oat Hay. \$20.00 @ \$23.00 Barley Hay. \$20.00 @ \$23.00 No. 1 Alfalfa Hay. \$22.00 @ \$27.00 Stock Hay. \$17.00 @ \$20.00 No. 1 Barley Straw, per bale. 50 @ .80

FEEDSTUFFS.

Rolled oats were higher this week, but otherwise the market prices were unchanged. The demand continues fair for all feedstuffs. Rolled Barley \$72.00 @ 74.00 Rolled Oats \$70.00 @ 72.00 Alfalfa Products \$42.00 @ 46.00 Cracked Corn \$79.00 @ 81.00

POTATOES, ONIONS, ETC.

Potatoes continue to advance in price, and all descriptions sold at higher levels this week. Onions continued strong at last week's figures. Hubbard squashes were weaker and sold a half cent off from last week's prices. The general vegetable market has been active during the week and the holiday demand has been fully up to expectations. String Beans, lb. 12 @ 25c Peas, lb. 15 @ 25c Carrots, per sack \$1.00 @ 1.25 Celery, crate \$5.00 @ 6.00 Cucumbers, box Nominal Do. Hothouse \$2.00 @ 3.00 Lettuce, per crate \$1.75 @ 2.00 Tomatoes, Stone \$1.00 @ 1.50 Hubbard Squash, lb. 2 @ 2 1/2c Pumpkins, sack 75c @ 1.00 Potatoes, River fancy, cwt. \$4.25 @ 4.50 Do. Choice, cwt. \$4.00 @ 4.25 Do. Salinas, cwt. \$4.50 @ 5.00 Do. Oregon Burbank, cwt. \$4.25 @ 4.50 Do. Oregon Gem, cwt. \$4.25 @ 4.50 Do. Idaho Gem, cwt. \$4.25 @ 4.50 Do. Sweetens, new, lb. 4 1/2 @ 4 3/4c Onions, Brown, sack \$5.00 @ 5.50 Do. Yellow, sack \$4.50 @ 5.00 Garlic, lb. 20 @ 22c

BEANS.

Beans continue quiet and firm. The expectations are that a much livelier market will develop after the holiday season, but at present there is not much movement. The firmness of the market is demonstrated in advances made in pinks, Mexican reds and large whites of the new crop. The San Francisco price of baby limas also advanced to within 25 cents of the association price. Variety Old crop New crop Bayos \$8.00 @ 8.50 \$9.50 @ 9.75 Blackeyes \$5.75 @ 6.00 \$6.25 @ 6.40 Cranberry \$6.00 @ 6.25 \$7.25 @ 7.75 Pinks \$5.50 @ 5.75 \$6.25 @ 6.60 Red Mexican \$5.00 @ 5.75 \$7.75 @ 8.00 Tepary \$2.50 @ 2.75 Garbanzos \$9.50 @ 10.00 Large Whites \$5.25 @ 5.50 \$6.25 @ 6.40 Small Whites \$6.00 @ 6.25 \$6.40 @ 6.50 Limas, Ass'n prices \$14.75 do. Baby, Ass'n prices \$13.00 Limas, S. F. prices \$13.25 @ 13.50 do. Baby, S. F. prices \$12.50 @ 12.75

POULTRY.

It is difficult to give a line on the poultry market. Quotations of the previous week cover the range of prices for the present week, but the main interest in the market has been centered on turkeys. They have sold as high as 75 cents in cases during the week and the prediction was made that they would go higher on account of the wet weather. However the arrivals seem ample to take care of the demand, and today's prices find very few birds selling at 53 cents, with 52 as the most reasonable quotable price for the top. On the other hand practically no stock in prime condition is being offered at less than 50 cents, and such an offer would excite suspicion. The

THE MARKET REPORTS

market for the day before the holiday. Wednesday, will depend entirely on the receipts over night and in the early morning. Broilers, 1 1/2 lbs. under. 35 @ 37c do. 2 to 3 lbs. 31 @ 35c Friers, 2 to 3 lbs. 33 @ 34c Hens, extra per lb. 34 @ 35c do. Leghorns 30 @ 33c Smooth young roosters, per lb. BUTTER.

The butter market continues slowly to advance. The exchange price of Tuesday and Wednesday of this week was 70 cents, this being the first time that the wholesale price on butter in this city has reached this price in the history of the exchange. The reason for the advance and extreme firmness of butter is largely due to the special holiday demand for good fresh butter. The advance in price is expected to bring an unusual amount of butter out of storage for immediate use. As there is something over twice the amount in storage as a year ago at this time there seems no likelihood of a real shortage. Thu. Fri. Sat. Mon. Tu. Wed. Extra .65 .65 .65 .66 .66 1/2 .66 1/2

EGGS.

Extra eggs dropped ten cents during the week. Pullets showed a decline of 7 1/2 cents and undersized of 8 1/2 cents. A number of reasons are given for this slump in prices, but perhaps the best reason is the drop in the Eastern market. Yesterday eggs on the New York market fell from 5 to 7 cents and today the New York price is again lower by 5 cents. A drop was looked for after Christmas day, but apparently the market became topheavy and fell before expected. Whether there will be further drastic declines after Christmas is a question, although, of course, it is conceded that there will be a gradual decline in price from now on until the peak of production is again reached. The drop in extras to 67 1/2 cents to the retail trade has

worried the storage men who have been holding this description firm at 60 cents. However, the official reports show but about 18,000 cases of eggs in storage in the San Francisco market, and the dealers in this description should have no difficulty in working these off without serious loss. Thu. Fri. Sat. Mon. Tu. Wed. Extras No. 1 .72 .71 .70 .68 1/2 .70 .62 Ex pullets 68 67 1/2 61 1/2 60 66 60 1/2 Undersized 63 1/2 61 1/2 61 1/2 59 60 55

CHEESE.

The cheese market has shown weakness throughout the week. Offerings have been liberal, but the demand seems to be anything but urgent. When California flats reached 28 1/2 for the fancy the firsts temporarily became normal. Oregon was firmly held at last week's prices, but there was very little demand. California Flats, fancy 28 1/2c do. Firsts 28c Nominal Y. A. Fancy 33 1/2c Oregon Triple 30 1/2c do. Y. A. 34c

FRESH FRUITS.

There was a good demand throughout the week for nearly all varieties of fresh fruits on the market. The holiday demand is reported to have been fully up to expectations. No changes in quotations are noted. Apples, Jonathan, Oregon \$2.50 @ 3.00 do. Spitzenberg, Oregon \$2.00 @ 3.00 do. Bellflower \$1.75 @ 2.25 do. Pippins, Calif. \$2.00 @ 2.25 do. CITRUS FRUITS.

Like the fresh fruits there was a good demand for citrus fruits throughout the week. The market is well supplied with all descriptions and prices are maintained at last week's level. Oranges, Valencia \$3.00 @ 4.50 do. Navel \$3.50 @ 5.00 Lemons, fancy \$4.75 @ 5.25 do. choice \$3.75 @ 4.25 do. Arizona \$3.50 @ 4.00 Grapefruit \$2.50 @ 3.00 do. standard \$2.75 @ 3.25

Special Livestock Market Report

San Francisco, Dec. 24, 1919.

CATTLE—This week the cattle market is very quiet, the holiday trade going largely to poultry, notwithstanding the unprecedented prices prevailing for same. Some prime beef has been in demand. In the East some depression is felt, and the lowest price levels of the season have been reached. Quotations are: Steers, No. 1 1000-1200 lbs. 10 3/4 @ 11 1/2c do. No. 1 1200-1400 lbs. 10 1/4 @ 10 3/4c do. 2nd quality 9 7/8 @ 9 1/2c do. thin 7 @ 8c Cows and Heifers, No. 1 8 1/2 @ 9 1/4c do. 2nd quality 7 1/2 @ 8c do. thin 4 1/2 @ 6c Calves, lightweight 12 1/2 @ 13c do. medium 11 @ 12c do. heavy 8 @ 10c

SHEEP—The sheep situation is firm. The run is not heavy, and the receipts are readily absorbed. Choice lambs and fat ewes are in especial demand. Quotations unchanged. Lambs, yearling 10 @ 11c do. milk 12 @ 13c Sheep, wethers 9 @ 10c do. ewes 6 @ 6 1/2c HOGS—The drop of about a cent on medium and heavyweights again evidences the erratic trend of the live hog market. The tone of the market will probably improve after the holidays.

Hogs, hard, grain-fed, 100 to 150 lbs. 14 1/2c do. 150 to 225 lbs. 14c do. 225 to 300 lbs. 14c do. 300 to 400 lbs. 13c

Los Angeles, December 24, 1919.

CATTLE—Steers firm and in fair demand but cows reported to be dull. Quotations are unchanged, being the same as last week. Per cwt. f. o. b. Los Angeles: Beef steers, 1000 @ 1100 lbs. \$9.50 @ 11.00 Prime cows and heifers \$8.00 @ 8.50 Good cows and heifers \$7.00 @ 7.50 Cannors \$4.50 @ 5.00 HOGS—This market reported steady and the demand is fair. Prices unchanged. Per cwt. f. o. b. Los Angeles: Light \$14.00 @ 16.00 Heavy average 225 @ 275 lbs. \$13.00 @ 14.00 Heavy average 275 @ 350 lbs. \$11.00 @ 12.50 Rough docked 20 lbs. piggy sows 40 lbs. and stags, 40 per cent.

Special Citrus Market Report

Los Angeles, Cal., Dec. 22, 1919.

The balance of the old crop of Valencia's will probably be cleaned up within a few days. They are selling on a basis of \$4.75 to \$5.00 delivered for Orange county fruit, and around \$3.50 delivered from other counties. Valencia's are beginning to show some decay and are being rapidly replaced by the new crop of navel from Tulare county, which are at this time exceptionally good. With the exception of about 300 cars the entire crop has been moved and will have gone into consumption by the first of the year. F. O. B. California quotations on Tulare county navels are

on a basis of \$3.75 to \$4 per box for cars running 30 per cent 12 1/2's and larger; and about \$4 on 150's and smaller. Most of the Southern California packing houses have remained closed, but are preparing for a big rush after the holiday season.

The lemon market is practically dead at this time, with the exception that some of the Middle Western markets are taking limited supplies at \$4 per box f. o. b. There still remains on the market 49,200 boxes of foreign lemons available of sale.

The total shipment of oranges from Southern California for the season was 2,649 carloads, and 514 carloads of lemons.

Mandarins, box \$2.00
Tangerines \$1.50 @ 3.00

DRIED FRUITS.

The holiday slackness of business continues in the dried fruits, but no tendency to weakness is noted. It is likely that after the first of the year the expected demand may force some prices to a slightly higher level, although it is most likely that present prices will show but little change.

Prunes, 1919 crop: Basis In 50 lb. boxes
Size—price
30-40s 21 1/2c
40-50s 18 1/2c
50-60s 16 1/2c
60-70s 16c
70-80s 15 1/2c
80-90s 14 1/2c
90-100s 14c
100-120s 13c

Raisins, 1919 crop: Seedling—
Fancy, 16s, pkg. 11 1/4 @ 11 1/2c
Fancy, 12s, pkg. 9 @ 9 1/2c
Choice, 18s, pkg. 11 @ 11 1/2c
Choice, 12s, pkg. 9 @ 9 1/2c
Loose Muscats—
4-crown in 25s 12 1/2c
3-crown in 25s 11 1/2c
2-crown in 25s 10 1/2c
4-crown re-cleaned in 25s 11c

HONEY.

There was but little interest in honey during the past week. On demand it might be said to show weakness, but prices showed no downward tendency, as both buyer and seller knew that lowering of price at this season would have little stimulating effect on the demand. Water White .18 @ 20c Light Amber (Mountain) .16 1/2 @ 17c Amber (Alfalfa) .14 1/2 @ 15 1/2c

RICE.

The rice growers firmly believe that failure of Oriental crops means higher prices for rice during the next few months, but a majority of the local dealers are suspicious of these reports of shortage in the Oriental crop and decline to base their price or expectations on it. As a consequence it is impossible to quote prices of California rice which dealers and growers would agree to be the market. Paddy rice has sold as high as \$7.75 and some growers are looking for \$8.00. Some re-cleaned California Japan has sold at \$12.50. But neither of these prices may be regarded as other than a momentary price and could not be stated as the market quotation even of one individual day.

LOS ANGELES.

Los Angeles, Dec. 22nd, 1919.

BUTTER.

Butter advances 1c since last week's report. Demand continues good and receipts holding up well, but are under last week's. We are able to give receipts for five days only—185,500 lbs. Fresh, California extra creamery .68c do. prime first .66c do. first .65c

EGGS.

This market shows another slump in prices. Fresh ranch declined 3c and pullets are 1c lower. A good demand is reported. Receipts for five days was 475 cases. Fresh ranch, extras .65c do. case count .61c Do. pullets .59c

POULTRY.

Turkeys are heavy, hens are in good demand. Young stuff is slow in selling. Prices steady and receipts fair. Broilers 1c lower. Broilers, 1 to 1 1/2 lbs. 37c Broilers, 1 1/2 to 1 3/4 lbs. 39c Friers, 2 to 3 lbs. 35c Hens 31 @ 33c Roosters (soft bone), 3 lbs and up. 33c Stags and old roosters, per lb. 19c Turkeys 35 1/2 @ 45 Ducks 25 @ 33 Geese 25 @ 35c

FRUITS.

Apples continue to sell well and prices are steady. There is little else on the market outside of cold storage stock. No changes in prices. Japanese Persimmons, lb. 8 @ 14c Apples—Bellflowers 4 tier \$1.75 @ 1.80 Do. Jonathan, packed box \$2.75 @ 3.00 Do. Red Permain, packed box \$1.75 @ 1.85 Do. White Permain, packed box \$2.00 @ 2.25 Do. Yellow Newtown Pippins, packed box \$2.00 @ 2.25 Do. Spitzenburg, packed box \$3.00 @ 3.50

VEGETABLES.

There is little coming in now from outside districts, except staples. The demand is good for all fresh stuff. Poor stuff hard to move at any price. Potatoes, Northern Burbanks \$4.25 @ 4.50 Do. Idaho Russets, cwt. \$4.50 @ 5.00 Sweet potatoes \$2.50 @ 2.75 Onions, Stockton yellows, cwt. \$3.85 @ 4.00 Do. White Globe, cwt. \$4.75 @ 5.00 Do. Australian Brown \$4.75 @ 5.00 Cabbage, per 100 lbs. \$2.00 @ 2.25 Lettuce, crate 75c @ 1.00 Rhubarb, per 30-lb. box 70c @ 1.00 Peas, per lb. 7 @ 14c Peppers, Bell, lb 10 @ 12c Celery, crate \$5.00 @ 5.50 Cauliflower, crate \$2.00 @ 2.25

HAY.

Receipts are a little better and demand good. Prices are steady and unchanged since last week. F. O. B. Los Angeles. Barley hay, ton \$25.00 @ 29.00 Oat hay, ton \$28.00 @ 31.00 Alfalfa Northern, ton \$30.00 @ 32.00 Alfalfa, local, ton \$33.00 @ 35.00 Straw \$14.00 @ 16.00

BEANS.

This market is still dull, but prices are holding up. Lambs, per cwt. \$12.00 Large white, per cwt. \$6.25 Small white, per cwt. \$6.50 Blackeyes, per cwt. \$6.00 @ 6.25 Tepary, per cwt. \$3.00 @ 3.25 Pink, per cwt. \$3.25

SURPRISE OF HER LIFE

Kinsella Co.—Since I've been giving my hens "TWO for ONE" they have given me the surprise of my life. I have kept hens for about 30 years, but never before have I had them nearly all laying at this time of the year. "TWO for ONE" is the miracle that has transformed my hens. You are to be congratulated on having such a wonderful egg producer.

MRS. ANNA McEMBER,
St. Mary's Lake, Pentwater, Mich.

**100 PULLETS—2,700 EGGS**

Kinsella Co.,
Gentlemen:—Your "TWO for ONE" is certainly great to start pullets laying. I began feeding it August 20th to my 100 early pullets and nearly all of them began laying at once. One month they laid 2,700 eggs. I can't say enough for "TWO for ONE."

MRS. E. E. NALL,
Lewistown, Mo.

BREAKS ALL RECORDS IN EGG PRODUCTION

World's Record in Egg Production Broken by 6 Different Flocks
of Hens by the use of "TWO for ONE."

READ WHAT THEY SAY:

56 HENS. 1734 EGGS

"Since I began the use of 'TWO for ONE' my chickens are now the picture of health, and are now regular layers. It hurried their moult and made them lay while moulting. I have never found its equal for egg production. I have received wonderful results, having gotten 1,734 eggs from 56 hens, and at this writing they continue to shell them out, laying to their full capacity."

JUDGE A. R. BERRYHILL, Vada, Mo."

28 HENS. 810 EGGS

"I truly believe your tonic is grand. I think it has helped my hens wonderfully. If anybody wishes to get lots of eggs they must give their hens 'TWO for ONE'. In one month I got 810 eggs from my 28 hens. Wishing you good luck, I am, yours truly,"

VIOLA SMITH, Udell, Iowa."

10 HENS. 299 EGGS

"I commenced feeding your tonic about 10 days before the 1st of September, and also fed it during September. I find since feeding the tonic I got 299 eggs from my 10 hens. The tonic is the best I ever tried and I shall always keep a supply on hand. It alone is what produced these results. Yours truly,"

P. S. SIEGRIST, Logan, Kas."

50 HENS. 1542 EGGS

"I am using your 'TWO for ONE' tonic and my 50 hens laid 1,542 eggs. The best tonic I have ever used."

MRS. E. M. HALSTEAD,
Strawberry Point, Ia."

10 HENS. 310 EGGS

Stanley Dillman, Glenbeulah, Wis., writes: "My flock of hens never skipped a day after 'TWO for ONE' had taken effect. In October my 10 hens laid 310 eggs, or an egg every day in the month, for each hen."

50 HENS. 1533 EGGS

Mrs. J. M. Duke, Wisdom, Ky., writes: "When I began using 'TWO for ONE' I was only getting one or two eggs a day. I am now getting 49 and 50. My 50 hens laid 1,533 eggs in October."

Each of the above statements was sworn to and witnessed before a notary public. They are only samples of the thousands of letters that are coming in to us from poultry raisers throughout every section of the United States, who are amazed and astounded at the truly marvelous results obtained by using "TWO for ONE." Nothing like it was ever heard of before. Records are falling North, South, East and West. All of the best efforts of poultry raisers heretofore pale into significance when compared with results obtained from the use of the great poultry tonic, "TWO for ONE."

World's Greatest Egg Producer

"TWO for ONE" tones up the flock. "TWO for ONE" makes laggards lay. "TWO for ONE" has been tried and tested in every state in the Union—was not put on the market until we were assured of results. "TWO for ONE" is sold under a positive guarantee—your money back if you are not satisfied. "TWO for ONE" keeps flocks healthy and prevents disease. "TWO for ONE" makes hens lay, during the coldest winter weather. "TWO for ONE" will beat the best your poultry yard has ever done. "TWO for ONE" will double, triple, may even quadruple your egg profits.

All Poultry Raisers Endorse "TWO for ONE"

Delighted with the Results

Kinsella Co.—I am simply delighted with the results obtained by the use of your poultry tonic, "TWO for ONE." I thought my hens were laying as well as they could before I started using "TWO for ONE," but since using it I find that every hen could be made to do her best all the time.—Mrs. C. W. Fitzhugh, Whitehall, Mont.

3 Dozen Eggs a Day Since Using "TWO for ONE"

Kinsella Co.—I will let you know how many eggs I have received since using "TWO for ONE" egg tonic, on the average of 3 doz. per day from 37 hens. Yours truly, Mrs. E. Munro, Stapleton, Neb.

12 Leghorns—191 Eggs.

Kinsella Co.—Have used your tonic before and like it very much. My 12 Leghorns laid 191 eggs in one month.—Mrs. Mary Rogers, Wolf Bayou, Ark.

66 Hens—1,155 EGGS

Kinsella Co.—Since using your "TWO for ONE" egg tonic my 66 hens laid 1,155 eggs in one month.—Mrs. F. W. Hottel, Montrose, Mont.

6 Hens—100 EGGS

Kinsella Co.—I think your "TWO for ONE" is 2-for-1 sure enough, and it sure made my hens lay. I have six hens and the last 3 weeks they laid 100 eggs, an average of 16 2-3% apiece.—Clifford Helton, Woodbine, Ky., R. F. D. No. 1, Box 35.

Doubled Egg Production

Kinsella Co.—My 10 hens have doubled their egg production since using your tonic. In September they laid 253 eggs.—Leonard Whitney, Henniker, N. H.

From 8 EGGS a Day to 24

Kinsella Co.—I commenced feeding your tonic on the 28th day of August, at which time I was getting 8 and 9 eggs a day. In 10 days I was getting 24. I have told all my friends about your wonderful remedy and what it did for my hens. I wish everybody would try it and get the results that I did from a \$1 box. I am thankful to you for the results, as eggs are selling at 82c per doz.—Mrs. Mollie Blankley, Unadilla, N. Y.

NOTICE

Owing to the steadily increasing cost of the ingredients used in the preparation of our "TWO for ONE" tonic, we will be forced to increase the price when our present supply is sold. Our advice to poultry raisers is to lay in a large supply at the present market price and avoid the increase which is sure to come in the near future.
